JANUARY-
JUNE

THE BUILDERS'
JOURNAL

AND ARCHITECTURAL ENGINEER

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING.

*IT is our aim, our ambition, our aspiration even,
to build our Journal worthily and well, not
for the hour only, but for future years; for the
few men in the forefront of an enduring and
a laborious Art; for the disciplined ranks of a
distinguished Profession; for the young men—
Architects to be—and for all who love a clustered
column or a flying buttress, a traceried window
or a Greek frieze; for the man, too, who honestly
plumbs a jamb*

55, FETTER LANE,
LONDON.

LIBRARY

CONTENTS

of ordinary issues. For contents of "Fire," "Contractors'" and "Concrete and Steel" Supplements, see separate indices.

ABBEY, St. Albans, 11.
Abroad, Architectural Employment, 178.
Academy: Architecture at the, 245;
 Banquet, 247; Lecturers, 100.
Acetylene for Country House, 66, 129.
Adjoining Owners, 53, 155, 223.
Admiralty, Architectural Draughtsmen at, 212.
Albert Hall, The, 278.
Aldwych and Kingsway, 151.
Alms-houses, 12.
Alpine Gallery, 57.
Alterations: 53, 197.
American: Cement Industry, 62; Ideas on Competitions, 217.
Ants in Basement, 211.
Approaches and Porches, 124.
Arch, The Modern, 29.
Arches: Cutting to, 168; and Piers in Foundations, Concrete, 211.
Architect and Critic, 225; and R.I.B.A. Form of Contract, 237; of the Houses of Parliament, 131.
Architects: at 1½ per cent., 227; Fees, 237; and the General Election, 1; Benevolent Society, 146; in Natal, 346; Society of, 102; Registration, 8, 20, 46, 111, 122, 173, 187, 252; Royal Institute of British, 21, 41, 47, 80, 100, 106, 126, 129, 154, 179, 226, 233, 236, 275, 307, 315, 329, 341.
Architecture: Drawings of Ancient, 117; Mahometan, 12; at the Academy, 245; Concrete-block, 224; at the Georgian Exhibition, 227; at the Glasgow Institute of Fine Arts, 177; Indian, 11; Park, 43; Repetition in, 151; of Southern France, 74; Theory of Proportion in, 31; Mediæval, of England and France, 93.
Architectural: Appointments in the Indian Government, 331; Assistants in South Africa, 121; Association, 12, 51, 74, 93, 119, 128, 142, 165, 195, 230, 275, 341; Ceramics, 126; Department, Board of Education, 319; Draughtsmen at the War Office and Admiralty, 212; Employment Abroad, 178; Models, 331; Work, Modern, 37; Publishers, 66; Record, 317.
Art Critic, The Candid, 243.
Assessors, 332.
Associates, Ruffling the, 111.
Attic, Constructing an, 223.
BALL-ROOM FLOOR, 292.
Bamberg, Drawings of, 192.
Bangor Library, 273.
Banquet, The Academy, 247.
Barrack Construction, 325.
Bath, Floor for, 343.
Baths, Books on Turkish, 66.
Bath-room, Condensation in, 107.
Beams: For Fire-Engine House, 250; Formulæ for, 54; Bending Moments of Fixed, 222; Stress on Inclined, 237; Tests on Reinforced Concrete, 138.
Bedroom, Damp Wall of, 66.
Belfast House Building Competition, 197.
Bending Moments, 107, 222.
Benevolent Society, Architects', 146.
Biscuit Factories, 250.
Board of Education, Architectural Department, 319.
Bolton Abbey, Vaulting, 278.
Books: Building Construction, 145; Estimating, 66; Hospital Design, 37; Libraries and Ironwork, 178; Mechanics and Physics, 250; Operating Theatres, 343; Ornament and Decoration, 19; Turkish Baths, 66.
Botolph Lane, Wren's House in, 107.
Bournville's New Schools, 253.
Bowling Green, Forming a, 66.
Bricklaying, Defective, 15.
Bricks, Strawberry-coloured, 129.
Brick Wall, Rolled Joist carrying, 178.
Brickwork: Egyptian, 76; Porous, 12.
Bridge, Vauxhall, 323.
Bristol, Port of, 133.
Builders' Commission, 66.
Building Construction: S. K. Examinations in, 13, 259, 279, 298, 338; Book on, 145.
Building Trade: Conciliation in the, 67; Learning the, 292; in 1905, 13, 24; Foreign Competitor in, 55; Experimental Science and, 328.
Building: Estates and Architects, 306; in New York, 129; Legislation, 152, 193; Line, 12, 211, 249, 263; Measuring a, 145; on Made Ground, 222; New London, 36; Jerry, 271; By-laws, 17, 253; in the Colonies, 13; Plot, 54; Stones, 74; Without a Builder, 43; in Egypt, 263.
Buildings: to Measure in North Wales, 331; and Earthquakes, 215; Loss of Heat from, 67; New London, 36, 68, 92, 109, 122, 132, 160, 169, 182, 238, 249, 266, 280; Scotland's Historic, 55; Towers on New Government, 329.
Bury St. Edmunds, Churches to Measure near, 305.
By-laws, Building, 17, 253.

CAMPANILE, THE, 271.
Canada, Surveyors for, 250, 319.
Casement Windows, 212.
Cathedral: Winchester, 215; Berlin, 25.
Ceiling, Trussed Rafter Roof with Coved, 156.
Cement: Expansion of, 54; Industry in America, 62; Trade, 139; Liquid, 66.
Ceramics, Architectural, 126.
Cesspool: for Country Houses, 121; in Running Sand, 11.
Chain, Stresses in Suspended, 91.
Chapels: Cheap, 97; Wesleyan, 167.
Cheshunt Public Library, 217.
Chimney: Construction, 8, 213, 222; Oversailing Courses on, 53; Stability of Tall, 19; Carrying up, 19.
Church Roof, Stability of, 120.
Church, St. Brelade's, Jersey, 121.
Churches to Measure near Bury St. Edmunds, 305.
City in the Making, A, 311.
Claim: for Interest on Unpaid Contract Balance, 73; in Respect of Specification Clauses, 167; in respect of Tender, 121.
Client, Hooking the, 187.
Clock Tower, Westminster, 107, 167.
Club-houses, London, 165.
Coal Stores, 319.
Coliseum, The, 252, 263.
Collection, A National, 337.
Colonies, Building in, 13.
Colonial Example, A, 151.
Colonial House, Liverpool, 33.
Colour Effects, 123.
Columns and Stanchions, Designing of, 156.
Commission, Builder's, 66.
Competitions, Notes on, 7, 26, 38, 49, 60, 72, 100, 118, 127, 143, 155, 166, 182, 196, 218, 236, 247, 261, 273, 274, 288, 300, 314, 331, 341.
Competitions, 26, 87, 117, 131, 142, 166, 190, 197, 217, 286, 313.
Competition Design by Proxy, 83, 122.
Competition, House Building, Belfast, 197.
Competition Reform Society, 126.
Computing Area of Irregular Plots, 168.
Concentrated Load on Fixed Beams, 178.
Concrete: Block Architecture, 224; Beams, Testing of Reinforced, 138; Domes, 291; Furnace Clinker for, 178; and Iron Floors, 343; Mixers, 98, 114; Piers and Arches in Foundations, 211; Reinforced, 16, 138, 163, 174, 177, 202, 222, 233, 241; Reservoir, Circular, 197; Septic Tank, Design for Covered, 305; Tank Walls, Thickness of, 250; Walling, 178.
Condensation in Bath-room, 107.
Congress, Architectural, 21, 288, 337.
Contract: Conditions of, 78; Extras on a, 222; Work not according to, 37.
Contractors' New Position, 1.
Coroner's Court, Mortuary, &c., Deptford, 166.
Correspondence: The "Tom Tower," at Christchurch College, Oxford, by Harry Hems, 10; Christ Church, Moss Side, Manchester, by W. Architects and the General Election.

WITHOUT entering the political arena we may opportunely make comment on the forthcoming General Election in so far as architects are concerned. It is regrettable that so few of the candidates are men possessing an enlightened sense of architectural and kindred matters. These matters have been flagrantly neglected by the Legislature. How often large Government buildings are spoiled for a few extra thousands which are wasted upon schemes that do not give any such return. Bills which come before the House of Commons framed by private commercial companies often interfere with existing monuments of architecture, and it is a great pity that there is no body of influence in the House that could be trusted to decide properly in regard to these matters. While nearly all the leading professions of the country, such as the legal, medical, naval and military, and clerical, are represented in Parliament, the architect and artist are practically unrepresented, while the civil engineering profession and building trades are very inadequately represented. The only candidate of the architectural profession we have noticed in the lists is Mr. T. B. Silcock, of the firm of Silcock & Reay, of Bath, who is putting up for the Wells division of Somerset. It is characteristic of the architectural profession that its members are somewhat retiring and do not take sufficient part in municipal life: and this applies still more to parliamentary life. It is to be

regretted in more ways than one because the constructive professions lead men to a somewhat wider outlook which would be especially serviceable to a statesman needing such knowledge, whereas the legal fraternity, whose abilities are more destructive, or tend merely to archæology, have exploited Parliament rather too much. In the direction of building by-laws for sanitation and hygiene the architectural profession can give valuable aid in legislation, while by their influence in that larger aspect of beautiful surroundings which makes for the well-being of the person and the cultivation of his higher intellectual faculties the architect and the artist are paramount. We think it is the duty of leading members of the architectural profession to put aside their personal disinclination to enter into political life, and thus aid in promoting the interests of the public and the dignity of their profession.

The Contractor's New Position.

THERE is a feature in the American contractor's business which promises to make its way into English practice; in fact, it has been adopted already by one or two firms here. On previous occasions we have referred in these columns to the anomalies of the present contracting system and to the evils of the ruinous competition which goes on—a competition which tends to dishonesty and what is practically betting on chance. The American contractor has, however, realized that there is a possibility of his making a legitimate profit by the use of new methods of contracting, and saving of labour and time in every direction. In such a system the contractor occupies the position of a true business organization, and has on his staff several commercial engineers (if they might be so called) whose function it is to keep abreast of all modern methods of construction and inventions. When a contractor is tendering for a job these engineers are called in to overhaul the architect's drawings and to see how they can in the design of the steelwork and the provision of mechanical plant convenience and expedite the erection of a building and save in the amount of material, while at the same time in no way interfering with the architect's design. In the building of heavy walls, for instance, they would propose to substitute stanchions at intervals and fill in between with thin partitions. Thus the compartments would be exactly the same and yet the ground area would be economized and all the heavy labour of erecting a substantial brick wall done away with. In this manner the engineers go over the whole of the design and see where it is possible to substitute any form of construction which is just as efficient but somewhat more economical. Of course it may be thought that this is taking away something from the architect which is within his

special province—and so in a sense it is—but we are inclined to think that after all there is no real loss to the profession. Such a method only applies to large buildings. There is a great deal of routine work to be done by the staff of an architect, and it only means placing a portion of this staff under the control of the contractor where they can gain that experience which is necessary to enable them to appreciate all the little points that make for economy. The architect in modern times has been more and more divorced from practical work and the control of the workman. The consequence is that he very often designs from theoretical knowledge, and his construction, though doubtless sound, is not progressive; whereas the contractor has continually to deal with those practical problems with which the architects of former times had to deal. This divorcing of the architect from practical work has always been decried by the leading men of the profession as naturally stagnating architectural progress and being most disastrous to artistic design. The architect now seems to be more and more relegated to the position of planner and chief organizer, and the fact that under this new method of contracting he retains his control over the contractor's staff means that his responsibility is in nowise decreased. These engineers that revise his plans and prepare their own constructional diagrams are only craftsmen in their particular part of the work, and the architect is still the organizing master of all the crafts. When very large works are undertaken in America they are usually in the hands of architects, who have such big staffs that they can do without the assistance of the engineers in the employ of contracting firms. Naturally this would always be best in such circumstances, but it would be impossible for an architect to retain very highly-skilled engineers unless he had a large quantity of work, whereas the contractor with his large turnover and capital can keep such skilled men in employ and when an architect with a smaller practice has need of their assistance he obtains it without risking anything. Of course, there is not so much competition, but what competition exists is sufficient to keep the price at a reasonable figure, and in any case the building is executed at a cheaper price than it would be under the ordinary system. This newer method, therefore, is in our opinion a warrantable innovation in this country. A contractor who obtains work in this way knows that he will be met by the architect with every desire to assist him to profitably execute the work, and he of course gives a guarantee, so that there is every reason for him to do his work honestly and well and not look upon the architect as a policeman for the client whom he is endeavouring to fleece because competition ever presses him towards it.

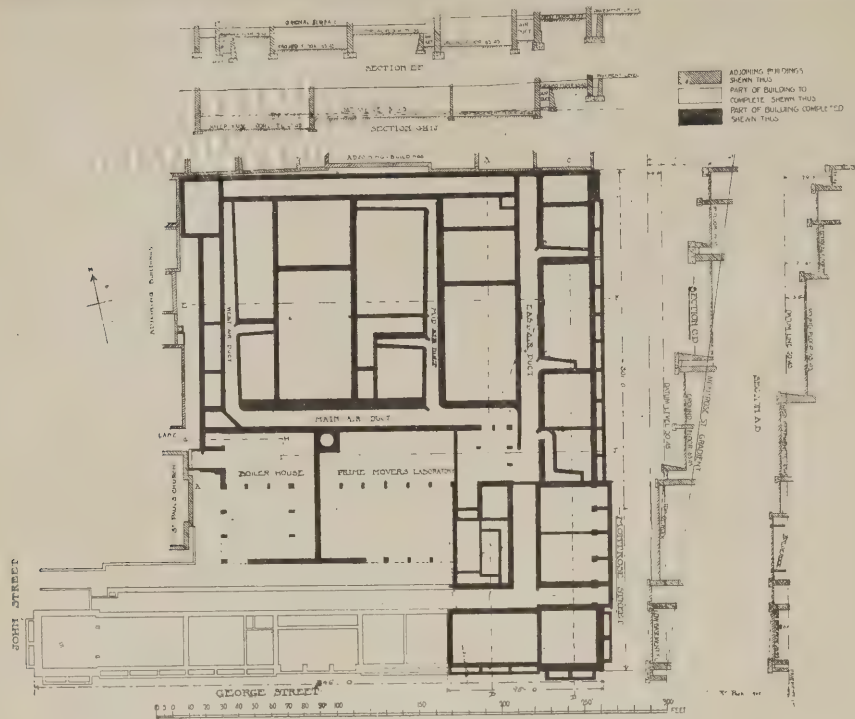

FIG. 1.—G. ASGOW TECHNICAL COLLEGE: PLAN OF MAIN WALLS AT FOUNDATION LEVEL.

UNDERPINNING.*

By R. PARK.

IN preparing this paper it has been my intention not to deal with underpinning as carried out generally, but rather to attempt to describe the method of underpinning and shoring carried out successfully for the buildings on the north, south and west sides of the new technical college at Glasgow.

Before dealing with the underpinning it will be well to describe briefly the site of the buildings, so as to give an idea of the slope of the ground. On plan (see Fig. 1) the portion of the building now occupied is of the shape of a rectangle, 850ft. by 301ft., having a small rectangle, 155ft. by 68ft., cut out at the south-west angle, but when the original plan is completed it will then be a rectangle 346ft. by 301ft., with a small part wanting at the north-west angle. The south frontage, or what is better known as the George Street front, will then be 346ft. long. Meantime the present section extends only 95ft. of this length, the basement floor being about 8ft. below the street level, which latter has a slight fall westwards. The east frontage, or Montrose Street front, is about 300ft. long. Here the slope or rise of the street is 1 in 7, there being a difference in level of 43ft. between the south-east and north-east angles of the new buildings, the low basement floor being 8ft. below the pavement level at the south-east corner, while what is known as the high first floor is about 14ft. below the pavement level at the north-east corner. This can be better understood by the section c d on Fig. 1, which is a section through the Montrose Street wing, showing what may be termed four different ground-floor levels. Fig. 1 shows four sections of the site with the ground-floor levels, and also the original surface level, from which a better idea of the site can be gained than from any written description. This plan also shows the adjacent buildings on the north and west sides, nearly all of which had to be underpinned.

At the outset I may state that when reference is made to the ground floor it is to be taken as the floor immediately overlying the

excavated surface, as there are five different levels which can be taken as relating to the ground floor, there being a difference of 37ft. between the highest and the lowest.

I will treat first the underpinning on the north side, as all the adjacent buildings on this side had to be underpinned; and here I may state that the difference between the ground-floor level (or what is known as the electrical-floor level at this part) of the new buildings, as compared with the ground-floor level of the adjacent buildings, is at some parts as much as 20ft., and in some cases the pits sunk for the concrete were 23ft. deep, measured from the underside of the foundations of the adjacent buildings.

The north boundary is about 250ft. long, and the whole of this had to be underpinned from end to end. The method adopted was as follows:—All the soil above the level of the foundations of the adjoining buildings was first removed; then a pit 6ft. by 4ft.

FIG. 3.—STEPPING OF BRICKWORK ON TOP OF CONCRETE.

was excavated hard against the wall of these buildings to a depth of at least 4ft. below the underside of the foundation of the adjoining building; so forming what is termed "an access opening," this opening giving the workmen access to the pit, 4ft. by 4ft., that had to be excavated directly underneath the foundation of the walls of the adjoining buildings.

The material which was excavated from these pits was of a loamy nature, overlying a soft clay; therefore a system of close timber sheeting had to be adopted to keep the adjoining earth in a firm state; underneath this soft clay was firm boulder clay. The pits were excavated until the firm boulder clay was reached, and to a depth at least 3ft. below the ground-floor level of the new buildings, so as to allow for the depth of the foundations of the new buildings being below floor level; but the boulder clay was generally more than 3ft. below the ground floor of the new buildings. A glance at the elevation of the underpinning for this wall (Fig. 2) shows the boulder clay to be from 5ft. to 8ft. below the ground-floor level.

After the firm boulder clay had been reached the pit was immediately filled up with concrete (composed of 5 parts of broken brick, 2 parts of sand and 1 of cement) to a height of about 3ft. from the underside of the old foundation, the concrete being allowed to stand from ten to fourteen days so as to give it time to set. The remaining 3ft. was then built up of brickwork and cement in the following manner:—The bricks were stepped upwards from front to back, so that when the inner top row of brickwork reached to the underside of the old foundation, it was directly keyed up with cast-iron wedges, and then another course was commenced on top of the last course at the front, stepping inwards and keying up similarly on reaching the old foundation with the top course, and so on until the last course at the front was reached, thereby ensuring that the wall was keyed up throughout its entire thickness. (See Fig. 3.)

The pits which received the concrete were made about 20ft. apart, so that the concrete and brickwork which was put in the first pit was sufficiently set to carry the weight of the wall before the pit adjoining it was excavated, there being generally three or four of these pits in progress at one time, but all in different stages of advancement.

The only part where shoring was used is shown on the elevation from A to B (Fig. 2), this being the part where the deepest of the underpinning was done. The adjoining building is used as a stable, and, as already noted, the difference of ground-floor levels is 20ft. As it was found that the underside of the foundation of this building was 10ft. above the original surface level, the earth or clay underlying this foundation being apparently held in position by an old wall (which is shown in section of pit No. 33, Fig. 4), this old wall had to be removed; its removal, however, presented no difficulty, owing to the old and crumbling condition of the wall.

The shoring used here consisted of seven steel beams of a heavy section let through the wall at the positions indicated on the elevation, and immediately above the level of the ground floor of the stable, one end of the beams resting on sole-pieces lying on the granolithic floor of the stable, the sole-pieces lying parallel to and at a distance of about 20ft. from this wall, so as to keep the pressure exerted by the weight of the wall on the ground under the granolithic floor well back from the old wall where the excavating for the pits was being carried out, the other end of the beam being supported on an upright timber resting on a platform composed of old railway sleepers.

The stable building is of recent construction, and the architect appears to have had

*A paper read before the Glasgow and West of Scotland Technical College Architectural Craftsmen's Society.

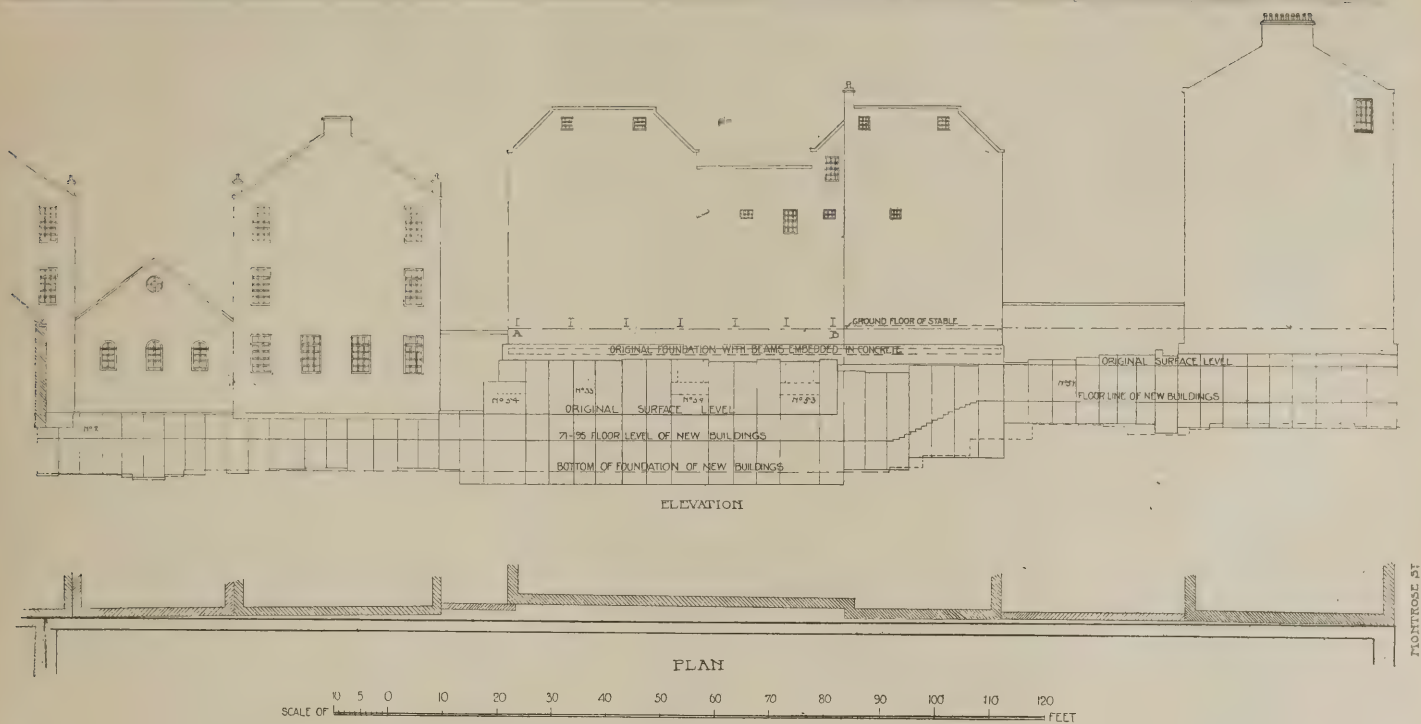

FIG. 2.—UNDERPINNING OF BUILDINGS ADJOINING NORTH WALL.

some doubt about the stability of his foundation; he relieved his conscience by placing in the concrete longitudinally sets of two 6in. by 4in. joists of various lengths, and to support these joists he had excavated three pits about 5ft. by 3ft. 6ins. by 6ft. 6ins. deep, into which some rough concrete was thrown to a depth of about 2ft. 6ins.; on top of this concrete brick piers were built hard up to the underside of the old concrete foundations containing these joists.

The nature of the soil underlying the foundations of these piers was not sufficiently stable, and even assuming that the soil had

been of a firm and compact nature it would have been necessary to remove the soil and underpin these piers, as the underside of the concrete blocks was from 8ft. to 9ft. above the ground-floor level of the new building at this part.

These piers are shown by dotted lines at pits Nos. 53, 54 and 59 (Figs 2 and 4). As may be seen from Fig. 2, they are longer than any of the others, owing to the fact that in excavating the pits underneath them it was advisable to excavate their full length at one operation, but they were among the last to be done, the brick piers with their

foundations being removed, and the underpinning carried right up to the underside of the foundations containing the iron or steel joists.

The method of timbering adopted to keep the adjoining earth in position during the excavation of the pits consisted of 9ins. by 3ins. timbers placed horizontally as soon as a depth of from 9ins. to 12ins. was excavated. These timbers were inserted by placing in position two timbers parallel to each other, and at a distance apart equal to the thickness of the concrete of the underpinning, these two being held in position by driving

FIG. 4.—SECTION OF UNDERPINNING AT NORTH BOUNDARY.

FIG. 5.—TIMBERING IN POSITION.

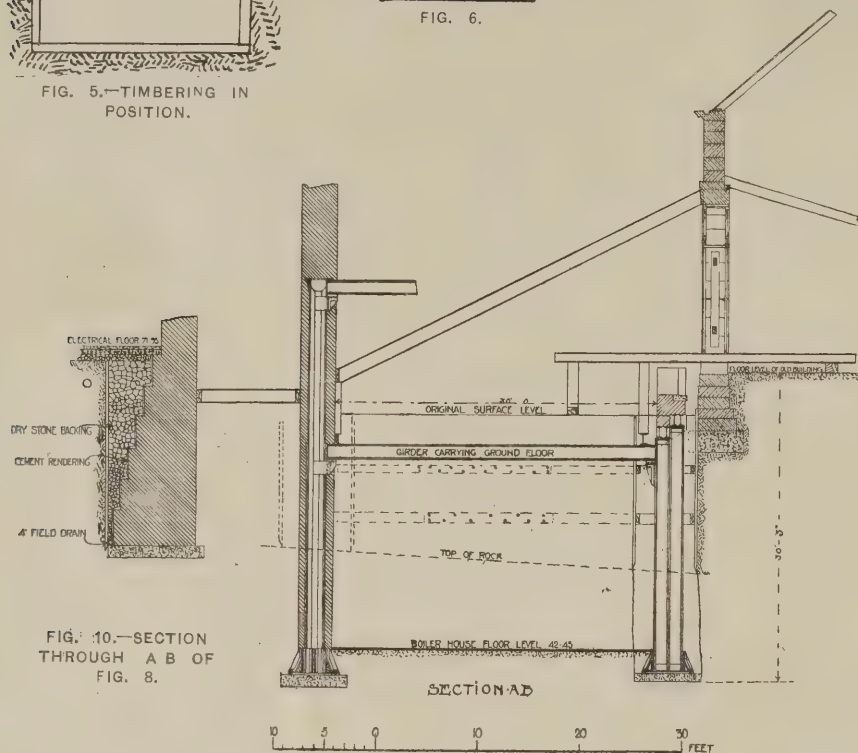

FIG. 6.

FIG. 7.—SHOWING BONDING OF CONCRETE.
(The numbers refer to the method of filling in.)FIG. 10.—SECTION
THROUGH A B OF
FIG. 8.

other two timbers in between them and at right angles to them and then excavating for another foot or so and again inserting another set of timbers, and so on until excavated to the required depth.

Before the concrete was put into the pit, two boards about 9 ins. wide were nailed at right angles to each other. They were then placed vertically against the sides of the pit, and at an angle of 45 degs. to them, these forming a concrete block which on plan was of the shape shown in Figs. 5 and 6, the reason for which will be explained later.

On coming to excavate the pit adjoining this last, one set of the gin. by 3 in. timbers was relieved from the side of the pit which had already been filled with concrete, and was again used for one of the sides of the pit which was being excavated, but the timber on the side next the concrete already in had to be removed as the concrete was put in, otherwise this timber could not have been got out, and besides would have prevented the concrete in one pit bonding with that of the next.

The vertical pieces which were fixed to the sides of the pit could also be removed on excavating the adjoining pit, and fixed in a new position. In this way the timbering was used repeatedly, and the only timbering that could not be got out was that at the back of the pits, as on excavating for the foundations of the new buildings the timbering in front was got out and again used in other positions.

The pieces already referred to as being fixed vertically up the sides of the pit served the purpose of forming a joggle in the concrete, thus keying the concrete of the pits into each other, and thereby tending to bond them all together (Fig. 7).

The underpinning of the west boundary was carried out in a similar manner to that of the north boundary. On this side it was only considered necessary to underpin two of the adjoining buildings, as there is a space of

FIG. 9.—SHOWING METHOD OF HOLDING
WALES IN POSITION.

about 10 ft. between the walls of the adjoining buildings and those of the new college, with the exception of 57 ft. at the north end, where the new college buildings project out and so form what is known as the north-west stair, and the wall of this projecting part is close up to the wall of the adjoining building.

The underside of the foundation of this building was found to be only 6 ins. below the ground-floor level (or what is termed the electrical-floor level) of the new college, and underneath this foundation there was soft clayey soil. It had therefore to be underpinned. The underpinning of this length of 57 ft. is on an average 10 ft. deep. At this depth a bed of clay was reached, which, although not a boulder clay, was considered to be of sufficient solidity to carry the adjoining buildings, which were only one storey in height. To avoid additional digging and underpinning the foundations for that part of the new buildings which formed the north-west staircase, the whole area of the staircase was covered with a layer of concrete 3 ft. thick, in which several 16 in. by 6 in. steel beams were placed. This part of the underpinning was completed without shoring of any kind.

The necessity for the underpinning of the other building on this boundary, although there is a space of 10 ft. between them, was partly owing to the height of the old buildings and partly to the difference of level between the bottom of the foundations of the old and new buildings, this difference being 14 ft.; and also owing to the nature of the soil that was encountered at this part of the excavations, consisting of very soft clay or slurry overlying the solid rock. This rock has a dip towards the south-east, and as its surface was practically coincident with the floor-level required for the air ducts at this point, there was no hesitation in removing the soft clay or slurry overlying the solid rock, and so ensuring a good foundation here. The length of this part of underpinning required for the adjoining building was 50 ft. 6 ins. It was carried down 8 ft. below the underside of the original foundation.

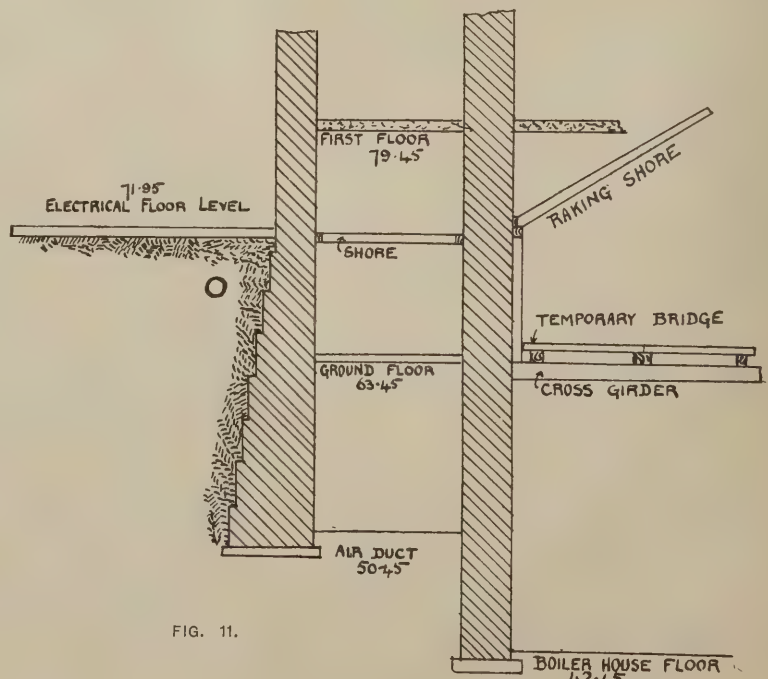

FIG. 11.

To give an idea of the softness and tenacity of the clay or slurry at this part, I may say that the excavators when working in the trenches were provided with deep sea boots to keep themselves dry, and if they did not use a plank to stand on (so as to distribute their weight over a larger area), or keep moving from one position to another, they gradually sank into the clay, and it was no easy matter to get them extricated from it if once they went beyond a certain depth. On one occasion two of the excavators were needed to remove the slurry from around the sea boots of a third who had taken too long to get his cutty in good going order; and at other times some of them, in trying to extricate themselves, managed to wriggle free, but left their boots remaining in the slurry.

At the south end of the west boundary of this section of the new college buildings stands St. Paul's Church. At one time it was thought that the east wall of this church might require to be underpinned also, but on sinking a pit alongside this wall it was found that the foundation of the church was resting on the solid rock, and as this pit had been sunk opposite the south wall of the back wing of the new college (A, Fig. 1) it was taken for granted that the remainder of the foundations of this wall northwards would also be resting on the rock, and on excavating later for the wall of the coal chute to the boiler-house this supposition was found to be correct.

Another place where it was considered advisable to underpin for a length of 34ft. was at the east gable of the old Andersonian Buildings, owing to the foundation at the north end of this gable not having been carried down to the rock. The underside of the foundation of this length of 34ft. was 15ft. above the ground-floor level (or what is known as low basement floor level), but it was not necessary that this full depth should be underpinned, as the surface of the rock was 6ft. above the ground-floor level, so that the underside of the foundation of the Andersonian College was about 9ft. above the surface of the rock. This foundation was gradually stepped downwards as it approached George Street, and at a distance of 34ft. from the north wall of the Andersonian College it was found to be resting on the rock.

The shoring required here consisted of two raking shores placed on the north-east angle of the Andersonian College. These shores are shown in position on the drawing of the elevation of the back wall of the Andersonian College on this page. The necessity for them is quite apparent, owing to the thrust of the arch acting on this angle of the building, the two arches at the east end of the building being supported on centres. These will be referred to when describing the shoring necessary for the construction of the south wall of the back wing of the new college.

It might be asked, Why underpin the Andersonian College, when it is going to be removed shortly?—but I must ask you to remember that the underpinning that I am dealing with was done towards the end of 1902 and the beginning of 1903. We now know that the old Andersonian College had still to be used for two years, but the thickness of concrete used here was only 3ft., as against 4ft. at the other buildings which were underpinned.

The concrete was prepared in the following manner:—The cement was first mixed as mortar, then mixed with brick in the proportions of 5 of broken brick, 2 of sand, 1 of cement and 1 of water by measure, the brick being broken to pass through a 3in. ring. Although the outside of the blocks was dry, it was seen after the tests that the inside was quite damp. A piece of the concrete was secured in a large block and removed to the contractors' yard, and there cut up into cube blocks, which blocks were to be tested to

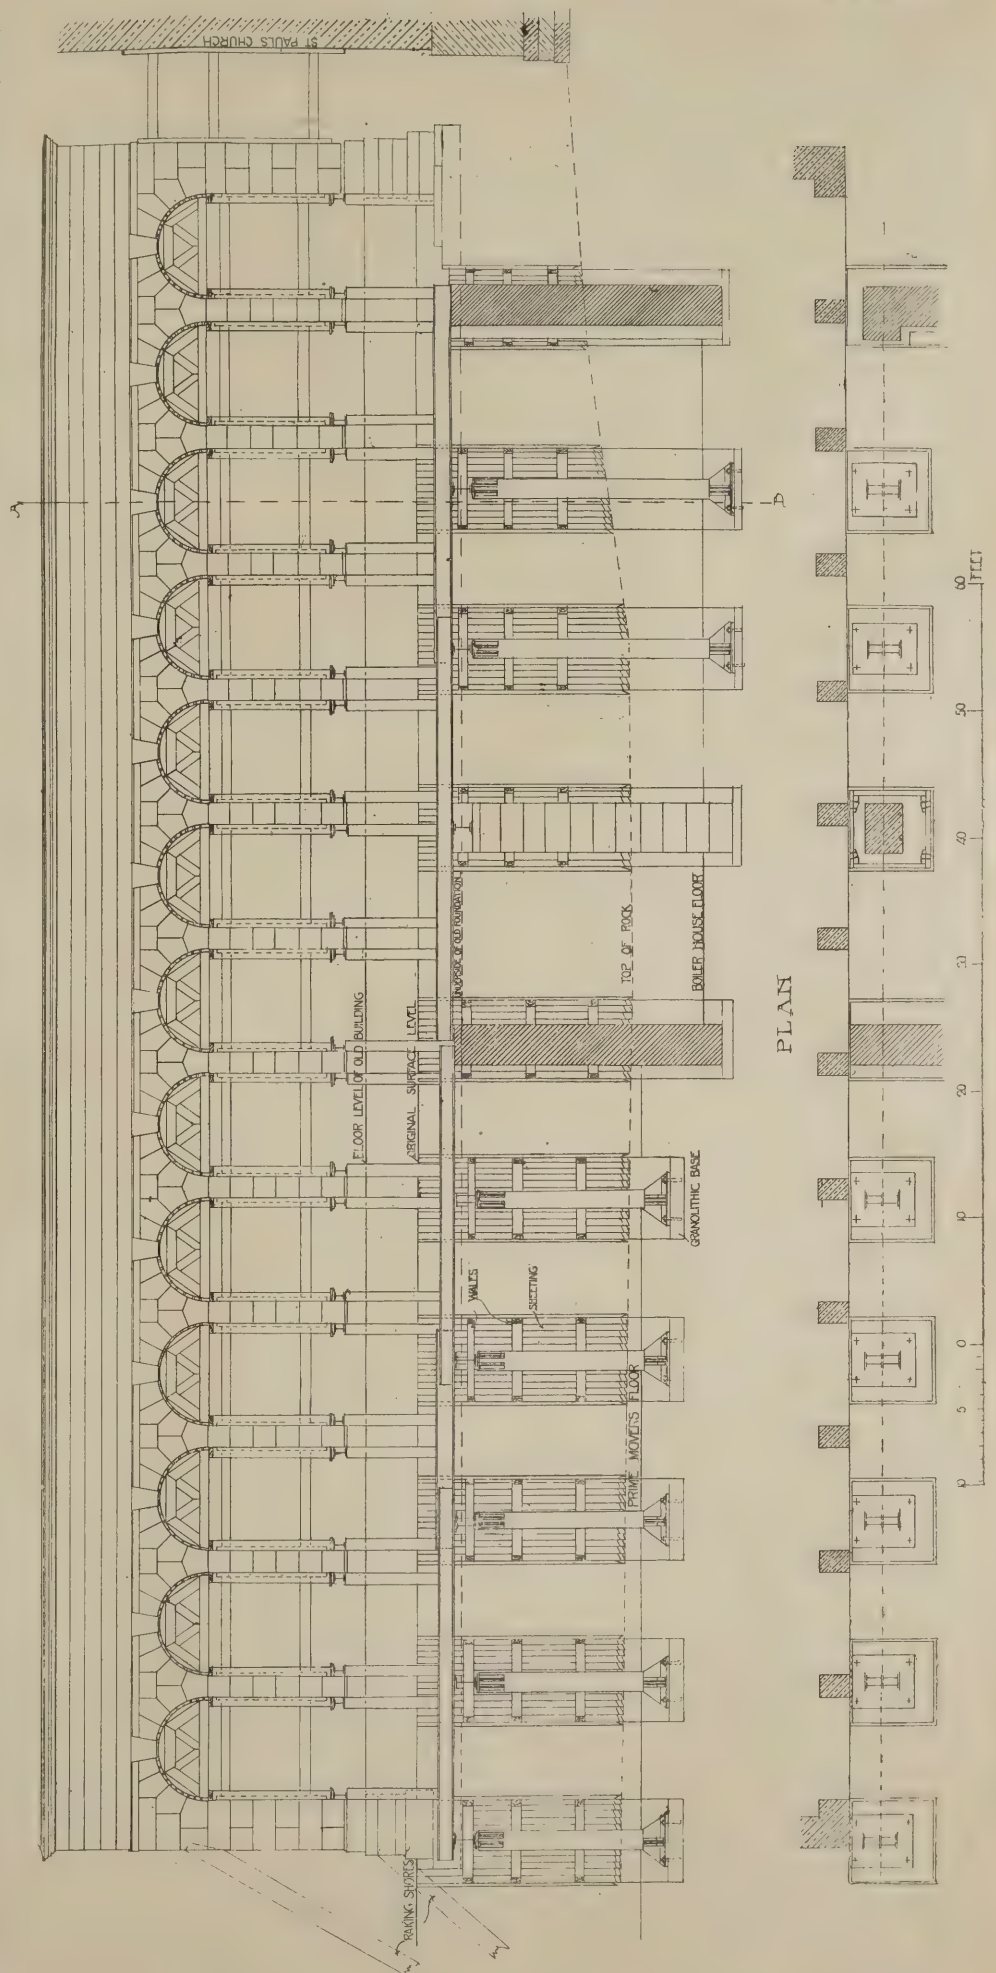

FIG. 8.—BACK ELEVATION OF OLD ANDERSONIAN BUILDINGS, GLASGOW, SHOWING STEEL STANDARDS CARRYING SOUTH WALL OF BACK WING OF NEW COLLEGE BUILDING.

show the weight or load required to fracture or crack them.

As these results have not yet been obtained, I am unable to state them here, but I can give you the results of this same concrete six weeks after making, namely:—

Cracking load	-	-	4½ tons per sq. ft.
Maximum load	-	-	58 " "

Load applied by hydraulic pressure to 2ft. cubes at the rate of about 10 tons additional per minute.

A commencement was made with the excavation of the first pit on October 16th, 1902, and the last one was keyed up on March 17th, 1903, the whole underpinning occupying five months. There were ninety-one pits, containing about 740 cub. yds. of concrete and brickwork.

The Andersonian College.

We now come to the treatment adopted for the north or back wall of the Andersonian College, which was 134ft. long, carried by thirteen arches resting on stone piers and the two abutments at the ends (see elevation of this wall, Fig. 8). Here there was only a space of about 15ins. between the external faces of the walls of the old and new buildings—just sufficient to allow the building of the new wall without interfering with the projecting cornices of the Andersonian College. The differences between the ground-floor levels of the old and new buildings at this point were 22ft. and 27ft. at the east and west parts respectively. This difference of 5ft. is due to the boiler-house floor being 5ft. deeper than the floor of the prime-movers' laboratory. It was found that the distance from the underside of the foundation of the Andersonian College to the boiler house floor was 19ft., yet here it was determined to do without underpinning this old wall of the Andersonian College, owing to the fact that the wall to be erected was carried on one stone pier, three brick piers, and a series of built steel standards composed of four 16in. by 6in. joists and two 18in. by ½in. plates, these standards being placed at a distance of 12ft. 8ins. from centre to centre and extended 2ft. above the next floor. Advantage was taken of this wall being carried by these piers and steel standards, as by the adoption of the following method no underpinning was required:—

Avoiding Underpinning.

The first thing to be done was to support all the remaining arches of this old wall, two of them at the east end having already been supported previous to the underpinning of the gable at this end. The centres supporting these arches were constructed of 9in. by 3in. timbers, carried on 9in. by 3in. uprights, the uprights resting on steel beams with the usual slack blocks between, the steel beams being from 24ft. to 30ft. long so as to allow them to project beyond the line of the walls and at the same time to be clear of the pits that were excavated to receive the steel standards. One end of these steel beams rested on horizontal timbers lying on the concrete floor of the old building, while the other end was supported on an upright timber resting on a sole-plate lying on the solid ground. As the east abutment was already supported by two raking shores, this end was considered secure, and the west abutment was secured by inserting three horizontal shores between the abutment and the wall of St. Paul's Church. The slack blocks under the uprights carrying the arches were then driven tight, so that the centres should take the weight of the arches and the walling above, and thereby relieve the weight on the stone piers in the event of any settlement.

Upright timbers were then placed against the sides of the stone piers and held in position by driving two horizontal pieces in each space, this being adopted to keep the piers perpendicular.

The position of the centres of the new piers and steel standards was then set out, and pits 6ft. 6ins. square excavated to the necessary depth to receive the steel standards, this depth being 21ft. at the prime-movers' laboratory and 26ft. at the boiler-house below the original surface level. The earth or soil encountered in the excavation of these pits was of the same nature as that last described—soft clay overlying the rock, so that timber sheeting had to be used until the surface of the rock was reached, the top of the rock varying from 13ft. to 16ft. below the original surface.

Timber Sheeting in Pits.

The timber sheeting used in these pits was 6½in. by 2½in. battens; the wales were half timbers 12ins. by 6ins.; but the sheeting was not inserted horizontally, as in the pits for the underpinning, but placed upright, the lower ends being bevelled obliquely from one face only, so that after the first batten was driven into the ground the next one was placed against it, with its longest edge to the edge of the one already driven; thus in driving the sheeting this oblique point kept the edges hard against each other, and thereby prevented the soft slurry from penetrating between the joints of the sheeting.

In driving the sheeting the pit was first excavated as deep as possible, without the timber sheeting, which was then inserted and driven down by using a heavy wood mallet, the workmen sometimes requiring to erect a scaffold to drive the timbers owing to the top ends of the sheeting being so far above surface level. Two wales were then inserted, one on each side parallel to each other and kept in position temporarily with iron dogs. Other two wales were then driven hard in between the first two, these last two being held in position by driving iron dogs across the angle formed by the wales, or by cleats secured with spikes, as shown in Fig. 9.

A space of about 1in. was kept between the sheeting and the wales to allow for the insertion of hardwood wedges, as the timber sheeting could be driven in the exact direction by slackening or tightening these wedges.

Rock Foundation.

After the top row of wales was fixed in position more of the soft clay or slurry was removed until the bottom of the timber sheeting was reached; then the sheeting driven further down, the hardwood wedges being tightened or slackened as required. Another row of wales was inserted in the same manner as the first row, and then more of the soft clay removed, and so on until the surface of the rock was reached. The rock was then removed to the required depth, blasting being necessary to slacken the rock in most of these pits. A wooden template which held the rag bolts to secure the steel standards was then placed at the desired level, and a foundation or levelling block was put in (consisting of granolithic and cement, 2 of the former to 1 of the latter), which was brought up to a level of within ½in. of the underside of the sole-plate. After this granolithic block was set the template was removed by unscrewing the nuts off the rag bolts. The standard was then lowered and set in position by inserting cast-iron wedges between the block and the sole-plate. By using these wedges the steel standard could be set exactly vertically and at the required level. A fillet of clay about 1½ins. high was then formed on the surface of the granolithic block, right round the edges of the sole-plate and at a distance of 3ins. from the edge. The space between the granolithic block and the sole-plate was then filled up by pouring cement-grout through a hole provided in the plate for this purpose until it came out at the edges of the sole-plate and rose to the top surface of the plate, the fillet of clay keeping the cement-grout in the required position and preventing

it running over the whole surface of the block. It was then allowed to stand for a few days until the grout was set. The nuts of the rag bolts were then tightened up, and the earth was then removed to allow the cross-girder (which rests on the brackets of the steel standards) to be placed in position and secured with bolts. These girders carry the 5in. by 4½in. steel joists which are placed at about 24in. centres and encased with concrete (composed of ashes and cement), which form the fire-resisting floors of the building.

After all the standards and piers with their cross-girders had been put in position, the earth was excavated from between the pits down to the bottom of the cross-girder and the four beams resting on the top of the standards were secured in position, after which they were encased in concrete and allowed to set, being then ready to build the brickwork of the wall.

Boiler-house Work.

We now come to deal with the excavating of the boiler-house. As I have already mentioned, the basement floor of this wing of the new buildings is taken up by the boiler-house and part of the prime-movers' laboratory (about one-third of this laboratory being in the basement floor of this wing, and not accessible until the Andersonian buildings were demolished). It was therefore unnecessary to excavate it, but a glance at the section (Fig. 10) will show that it was necessary to excavate about 5ft. deep all over this area so as to allow the concrete of the floor over the prime-movers' laboratory to be put in. A glance at the section shows that this excavation of 5ft. could not be done until another method was adopted to support the north end of the steel beams upon which rest the uprights supporting the centering carrying the wall. To get over this, steel joists were placed on the top of the cross-girders, close to the south wall and running parallel to it, and by inserting half timbers from the top of these to the underside of the steel beams upon which the centering rested a secure support was formed for the centering, and the remainder of the earth could then be removed without further trouble.

The boiler-house had to be treated differently, as the boilers were to be in position and ready for use at the beginning of the present session. Therefore none of the excavations could be held over, as was done with part of prime-movers' laboratory.

The First Step

was to put in steel joists on top of cross-girders to support the centres carrying the arches and wall above. This was done similarly to that part for the prime-movers' laboratory already described.

You will notice from the plan (Fig. 1) that the boiler-house is immediately beside the lane that leads off John Street, but 25ft. below the level of the lane; and as nearly all the material required for the construction of the building was brought in by this way a temporary bridge had to be formed to allow all necessary material to be delivered. This temporary bridge consisted of three 18in. by 18in. timbers resting on the top of the cross-girders, and immediately resting on the top of the 18in. by 18in. timbers railway sleepers were placed.

In excavating this part it was necessary to drive timber sheeting from the one pit to the other so as to prevent the soil escaping from under the foundations of the Andersonian College. By excavating the soil or earth directly on the north side of the pits we removed the embankment which was taking the thrust exerted through the wales, due to the soft earth under the foundations of the old college, and therefore long wales, stretching from one standard to another, were put in, and held in position by driving short struts between the wales and the standards, with a

long horizontal shore between each standard, running right back to the north wall of the boiler-house, and having a half timber inserted between its end and the wall, to distribute the pressure on the wall. These shores are shown on Fig. 10. The top wales being fixed in position, the remainder of the sheeting between the pits was driven down as far as possible, and then the earth removed from over the area down to the bottom of the sheeting. Another row of wales was put in and secured as described above, and so on until the top of the rock was reached.

The raking shores shown on Fig. 10 were inserted to prevent the wall from overturning, owing to the vibration caused by the blasting of the rock, and the scarcement of the old foundation being cut off. These raking shores were 16in. by 16in. pitch-pine logs about 40ft. long, and were placed directly above the piers and underneath the string-course of the old wall, while the other end abutted against the north wall of this wing and kept to the necessary height (so as to allow the carts coming over the bridge to pass under them) by resting on a half timber which was supported by two uprights resting directly on the cross-girders.

Another horizontal shore was placed on

the other side of this north wall of the new building, so as to direct the thrust exerted by the raking shore against the embankment of earth which is held in position by the retaining wall at o. (Fig. 11.)

NOTES ON COMPETITIONS.

Carnegie Libraries.

At this season of the year, when hearts and purses have been opened wide and there has been much giving and receiving, it is not unnatural in the period of calm which succeeds the time of revelry that the mind should turn to an inward contemplation of philanthropy and its various effects. The gift personal affects mainly the recipient. The gift public affects not only the recipient but all those who are instrumental in assisting its progress through the devious paths which lead to the desired end. Philanthropy, as such, should affect beneficially all agents engaged in its dissemination, and when this desirable aim is not attained the bloom is brushed from the fruit and evil has been wrought in an attempt to do good. Such has been the case in connection with the

proposed Carnegie Free Library at Shaw, the ridiculous conditions of which were commented upon in these columns a fortnight ago; nor is this by any means the only instance where a competition for a library of this nature has been promoted under auspices so unfavourable. It cannot be that so great a philanthropist as Mr. Carnegie is indifferent to the wrong done from time to time to members of an arduous profession, unless, indeed, he be ignorant of the fact. Ignorant he certainly is not of the desire of members of the profession that his libraries should not be the subjects of unfair dealings, for to that end he was approached by the Royal Institute of British Architects.

Mr. Carnegie gives his money and his formal approval of the selected design, if the latter conforms with his opinion, no matter under what conditions it has been obtained. With the desire to know what manner of building his generosity is to be productive of, no one would cavil, but with the frame of mind which causes him to view with indifference the maltreatment of the competitor no architect could sympathize. It is nearly two years since the R.I.B.A. did all in its power to safeguard the interests of competitors; is it not time that competitors took the matter into their own hands?

Carnegie Branch Library, Greenwich.

It is a relief to be able to note that this is one of the Carnegie libraries with satisfactory conditions, and it is to be hoped that nothing will occur to mar proceedings which have commenced well. Within a few days of going to press several of the competitors have had their deposits returned, and have sought the envelopes in vain for an announcement of the assessor's award. The return of a deposit unaccompanied by an announcement is somewhat unprecedented, and the recipients of lonely cheques are, under the circumstances, in a state of perturbation.

North Wales University College.

At the last meeting of the council of the University College of North Wales it was decided to hold a limited competition for the new college buildings proposed to be erected. Architects are invited to submit their names to the Plans Committee.

Milan Exhibition: Designs for Workmen's Dwellings.

This is an international competition for workmen's dwellings suitable to the conditions of Northern Italy. Competitors must make themselves acquainted with the rules laid down in the Italian Artizans' Housing Bill of April 24th, 1904. Estimates of cost on the basis of the prices contained in the standard schedule of prices for the buildings in the commune of Milan and other data are required. The competition comprises three categories, and two prizes are offered in each category, the first amounting to £240 and the second to £80. An international jury will make the awards. The Hon. British Commissioner for the Milan Exhibition is Mr. Arthur Serena, 1 and 2, Oxford Court, Cannon Street, London, E.C.

Kingston School Competition.

Mr. F. W. Roper, of Adam Street, Adelphi, is the successful architect (among three others, selected) for the proposed new schools in Richmond Road, Kingston-on-Thames.

King Edward VII. School, Fairhaven.

Of the fourteen sets of designs submitted in this competition the governors of the Lytham Charities have awarded the first premium of £250 to those by Messrs. Briggs & Wolstenholme, of Liverpool; the second (£100) to Messrs. Broderick, Lowther & Walker, of Hull; the third (£50) to Messrs. Potts, Son & Hennings, of Manchester; and the fourth (£25) to Mr. G. H. Willoughby, of Manchester. Prof. Beresford Pite was the assessor.

This entrance forms part of a scheme for alterations and additions to an old house in Sussex which in itself is of no particular interest. The porch is built in Bath stone and is circular on plan. It connects the centre line of the hall with that of the formal garden on the west side of the house, the principal feature of which is the lily pond shown in the foreground of the drawing. The carving to the porch was carried out by Messrs. Martyn, of Cheltenham, and the interior woodwork by Mr. John P. White, of Bedford, the architects being Messrs. C. E. Mallows and Grocock, of 28, Conduit Street, London, W.

CHIMNEY CONSTRUCTION.

An Interesting Scottish Arbitration Case.

MR. W. FORREST SALMON, I.A., F.R.I.B.A., of Glasgow, has sent us a copy of his finding as arbitrator between Messrs. Edmundson's Electricity Corporation, Ltd., of London, and Messrs. John Purdie & Co., contractors, of Hamilton, in regard to the erection of certain parts of the superstructure of the burgh electricity station at Almada Hill, Hamilton—in particular the boiler-house chimney shaft. The architect was Mr. John Armitage, of London, and the clerk of works was the resident engineer for the contractors at Hamilton. The foundations for the chimney had been put in by another contractor. The basement was to be built of stonework to a height of about 20ft. and the superstructure was to be of brick. After the contractors had completed the basement of the chimney and the brick superstructure had proceeded till the total had reached a considerable height, a set occurred and cracks appeared at the basement near the south-west corner adjoining the flue port. The architect was of opinion that the only satisfactory way of getting over the difficulty of the settlement was to take the chimney down and rebuild it, but delayed finally pronouncing on the matter until he made further enquiries. The contractors demurred to the chimney being taken down on the ground that it was a sufficient chimney, conforming to the contract, and that the architect had passed it. They proposed arbitration, but this was declined. Eventually, however, the employers (Edmundson's Corporation) thought it advisable to check the opinion of the architect by taking the opinion of some outside party. As a result, Mr. Bruce, Dean of Guild of Edinburgh, gave a report which condemned the chimney.

Attempts to adjust the matter at the time were futile, and on April 11th, 1904, the architect ordered the chimney to be removed. The contractors declined to obey this order; nevertheless the architect had the same carried out in June, 1904. The contractors then took proceedings in the Sheriff Court at Hamilton, craving the balance of the contract price and for interdict. They were not successful in obtaining interdict before the chimney was taken down, and the action was sisted in view of the provisions for arbitration contained in clause 33 of the general conditions attached to the agreement between the parties.

The parties failed to arrange arbitration by joint application under the above-named clause, and eventually the employers themselves moved under the provisions of the clause, with the result that Mr. Salmon was appointed arbiter.

Mr. Salmon found neither party entitled to damages or to expenses, and both parties jointly liable for costs. In his finding Mr. Salmon says: "The plans and specification of the basement of the chimney were in my opinion faulty, inasmuch as according to them part of the basement was to be built entirely of common rubble and bedded and jointed with common mortar, whereas the other parts had to be faced with square-dressed Corsehills stones bedded and jointed with Portland cement. This difference was aggravated by the fact that on one side of the flue port were the hard Corsehills stones with cement joints and on the other side of the flue port the rubble stones from a local quarry and the common mortar joints. Before the basement was commenced a proposal was made, for which the contractors claim the credit, to build the basement entirely of Corsehills stone. The contractors offered to do this at an extra price, but the architect declined to authorize it, and apparently it was left to the contractors to build the basement of the chimney with or without remedying the defect referred to. As

the basement of the chimney could not have been built as designed without liability to set unequally, and to fracture as a result therefrom, in my opinion when the question arose the architect should have insisted on the basement being built entirely of Corsehills stone, or at least faced all round with Corsehills stone. The question as to who should pay for the extra facing might have been settled in a simple way without interfering with the progress of the work. On the other hand, the contractors under the agreement were held to have concurred as practical tradesmen in the method and style of construction to be adopted, and the sufficiency of materials proposed to be used, and they undertook to execute anything omitted from drawings, specification, &c., which was fitting to be done for the completion of the work (clause 6). In addition they also undertook responsibility for any injury the work might sustain from any cause, and undertook at completion to deliver the whole in a 'perfect, clean, complete and uninjured state' (clause 13). If, as they admit, they considered there was a defect to be remedied, then they were bound to correct it themselves if it was necessary for the satisfactory completion of their contract (*McElroy & Son v. Tharsis Sulphur Co.*, 1877, 5 R. 161). The contractors say the architect ordered them to proceed without correcting the error, but this is not proved, and in my opinion, even had it been proved, it would not have been relevant, seeing that the architect had no power to authorize a defective chimney to be built. The contractors' explanation of the damage by the subsidence of foundations, overflow of water from tanks, weather, &c., are not in my view proved, and I cannot concur in their contention that the examination from time to time of the chimney which was made by the architect during the course of its construction amounted to an approval within the meaning of the contract. Further, if the work was not to conform to contract, there could be no approval by the architect in a question between the contractors and the employers, at least until the work was certified by the architect as approved. The employers were not bound to accept a doubtful chimney, and the contractors have not discharged the onus on them to prove the sufficiency of the chimney. In saying this I have left aside the whole question of the architect's right to order the chimney to be taken down, but if he was not barred by his own actions in exercising that right I think it clear that, in view of the conflict of evidence, his non-approval cannot be said to have been unreasonable or capricious.

"I do not base any part of my findings on the analyses of mortar, or the photographs which have been produced. Proper steps were not taken to ear-mark or verify the samples of mortar taken, and the analyses are of little use without an analysis of admittedly sound mortar for comparison. The photographs also were taken after the work had been defaced by unskilled persons; and though this defacing may have been done in good faith to show more plainly certain alleged defects, I think it was most regrettable. . . .

"Dealing with the question of damages, the contractors cannot recover anything seeing that their claim depended on the question of the sufficiency of the chimney. Neither can the employers, as their claim could not have arisen had their architect supervised the work as carefully as its nature demanded and had he exercised proper care in the choice of materials and insisted on the basement being built of the same consistency on all sides. It was unfortunate too that the clerk of works who was the resident engineer of the employers should have been in the contract appointed clerk of works and deputy of the architect for the purpose of seeing the contract carried out. As he himself stated in evidence, and is supported by the evidence

of the architect, he, though a skilled electrical engineer, was not skilled in building construction. Apart from these considerations, however, the employers have not instructed damages by sufficient competent proof. . . ."

IRISH OPINION ON REGISTRATION.

AT the recent annual meeting of the Ulster Society of Architects held at Belfast—Mr. W. J. Gilliland presiding—the annual report of the council was presented and adopted. This stated that in October the Society had passed a resolution unanimously supporting the R.I.B.A. Bill for the Enrolment of Architects, and urging its adoption at as early a date as possible. "It is to be hoped that the Royal Institute of British Architects will not fail to use their utmost endeavours to obtain Parliamentary sanction for this measure."

A conference had been arranged between a sub-committee of the Society and the quantity surveyors practising in Belfast, with the result that the surveyors had formed themselves into the Belfast Quantity Surveyors' Society.

Deputations had waited on the Tramway Committee and Belfast Corporation with reference to the appointment of an architect to design the additions to the electricity generating station, the original portion of which was most creditably designed and carried out under the superintendence of a member of the Society, but the Corporation refused to appoint an architect, and entrusted the work to the staff of the city surveyor.

A Chair of Architecture at Queen's College, Belfast.

The important question of architectural education had not been overlooked, and a deputation from the council had waited on the president of Queen's College to advocate the establishment of a chair of architecture, or at least a lectureship, in connection with the present scheme for the extension of that college.

The Anomaly of the County Surveyor.

The attention of the Society having been called to a custom prevailing in some districts of allowing county surveyors, assistant county surveyors and surveyors to urban councils to engage in private practice, it was resolved that the attention of the various county and urban district authorities in Ulster be called to the desirability in every case of terminating the practice. It was an anomaly that surveyors to urban district councils should have the power to approve plans prepared by themselves and to approve or disapprove plans prepared by architects who were in private competition with them for private practice. On the one hand, the public interests suffered, while on the other it was grossly unfair to architects practising in the district. The difficulty of obtaining the services of a competent surveyor and adequately remunerating him for his entire time might be got over by grouping urban districts under one surveyor, or other suitable means.

The scrutineers handed in the result of the ballot for officers and members of council for 1906, to take up office on January 1st:—President, J. J. McDonnell, J.P.; vice-president, F. H. Tulloch; hon. secretary, W. Hartley Patterson.

Slate Quarrymen's Strike.—750 quarrymen employed at the Talsarn and Cilgwyn slate quarries marched on Saturday from Pen-y-groes, nine miles away, into Camarvon, where they held an open-air demonstration as a protest against the proposed reduction in wages at the quarries. It is stated that on account of the great depression in the Welsh slate trade the management have determined to reduce the wages 10 per cent. The men are willing to consent to the reduction so far as it applies to the poundage, but object to any reduction of the fixed wage.

UNIVERSITY OF ILLINOIS

Notes and News.

A new Police Station at Walker. New-castle-on-Tyne, is to be erected at an estimated cost of £7,000.

A Queen Victoria Memorial School at Dunblane is to be erected from designs by Mr. John A. Campbell, of Glasgow, at a cost of £50,000.

A new Free Library at Walkley, Sheffield, was opened recently. Mr. H. L. Paterson, A.R.I.B.A., of St. James's Street, Sheffield, was the architect, the general contractors being Messrs. D. O'Neill & Sons.

The West Front of Winchester Cathedral is in a very bad state of repair, and for the safety of the public the Dean and Chapter have closed the three western doors, leaving only the south door as a means of public entrance to the cathedral.

Mr. W. Noble Twelvetrees, M.I.M.E., A.M.I.E.E., has been elected a member of the executive of the British Fire Prevention Committee, vice Mr. Lionel J. Langridge, A.M.I.E.E. He has also been nominated to serve on the General Testing Arrangements (Standing) Sub-committee.

A National School of Architecture is to be founded in New York by the Society of Beaux-Arts Architects, on the lines of the Ecole des Beaux-Arts in Paris. Messrs. Walter Cook, D. Despradelles, B. P. Trowbridge, John M. Carrere and Lloyd Warren have been appointed as a committee of five to consider the scheme in detail.

Indications of Trade Revival.—At the recent annual dinner of the Edinburgh, Leith and District Employers' and Allied Trades' Association, and the Edinburgh Building Trades' Exchange, Mr. David Metie said they had passed through a very dull season, but he believed they had come through the worst, and were now entering upon a new cycle of prosperity.

North Lincolnshire Brick Trade.—In the North Lincolnshire brick trade the year just closed has shown some improvement on 1904. Between 350 and 400 men are employed in the season, and the output is estimated at from twenty to twenty-five millions per year. The year 1903 saw the tile trade flourishing remarkably well, but during 1904 and 1905 there has been a decided falling away.

Electric Lifts on Ocean Liners.—Messrs. R. Waygood & Co., Ltd., of Falmouth Road, S.E., have been commissioned to construct electric passenger and service lifts to be fitted in the new S.S. "Kaiserine Augusta" being built for the Hamburg-American line by the Vulcan Engineering Co. of Stettin. This order is the direct result of the satisfaction which has been given by a similar installation, fitted by the same firm, in the S.S. "Amerika," built by Messrs. Harland & Wolff, of Belfast, which consisted of an electric passenger elevator and three service lifts. This latter we understand the first case in which an electric passenger lift has been fitted in an ocean liner, and on the first voyage of the new steamer this lift carried 4,500 passengers in about 2,000 trips, giving the greatest satisfaction, and working well under all conditions of the voyage. In view of the great attention devoted by German firms to electrical engineering, and the long start which they had of British manufacturers in this direction, it is very encouraging to find that English makers should be selected to supply an installation of this kind in a German shipyard. It is stated that the Cunard S.S. Co. are also arranging to fit electric passenger lifts in their new liners, which are being built at Clydebank and at Newcastle, so that these luxuries will no doubt soon form a regular portion of the equipment of these ocean hotels.

A new Church at Ben Rhydding, Yorkshire, has been erected from designs by Messrs. Chorley & Connon, of Leeds.

Hever Castle is at present being restored for Mr. W. W. Astor by Messrs. John Thompson & Sons, who are employing no fewer than 350 men.

A new Glasgow Board School—Hayfield Public School, South York Street—has been erected. It is built of red sandstone, in Renaissance style. The architect was Mr. John Hamilton, of Glasgow.

The Shropshire Arts, Crafts and Industrial Exhibition will be held in the Music Hall, Shrewsbury, from May 1st to 5th. The hon. secretary is Mrs. Mather, Coneybury, Cleobury Mortimer, Shropshire.

New London Buildings.—The London County Council have voted £111,610 for the erection of a new training college for teachers and a central school of arts and crafts in Southampton Row, £80,050 for the erection of artisan dwellings, and £30,430 for the erection of cottages on the White Hart Lane estate at Tottenham.

Heavy Sentence for Stealing Lead Piping, &c.—At the Clerkenwell Sessions recently Nathaniel Thomas, a builder, for eight years member of the Westminster City Council, was sentenced to fifteen months' imprisonment in the second division for being concerned together with Frederick Woodhouse and George Bevis (who received sentences of twelve months and four months respectively) in stealing and receiving coils of lead piping, quantities of solder, and sanitary appliances and fittings from John Boulting & Son, in whose employ Woodhouse and Bevis had been—the one for thirty-seven years and the other for thirty-three years.

The largest Contract for Spiral Staircases ever placed.—The St. Pancras Ironwork Co., Ltd., have received an order from the Underground Electric Railways Co. of London, Ltd., for spiral staircases to be fixed at all the stations on the following tube railways:—Baker Street and Waterloo; Great Northern, Piccadilly and Brompton; Charing Cross, Euston and Hampstead. There are upwards of forty stations. The staircases are about 18ft. diameter and vary from 50ft. to 200ft. in height, according to the position of the stations. Treads and landings are covered with a new and improved non-slipping material. The staircases are built entirely of steel, and were specially designed by the St. Pancras Ironwork Co. for the railway company. The design involves an entirely new principle in staircase construction, combining great strength with lightness and economy of material, while being of very neat appearance. Some of the staircases are already finished.

Lancashire Cottage Exhibition.—The particulars have now been issued of the cottage exhibition which is to be held at Cleveleys (between Blackpool and Fleetwood) from July to September next. Prizes are offered in each of the five classes, as follows:—Class 1, detached cottage, 1st prize £100, 2nd £50, 3rd £25; class 2, pair of cottages, 1st £100, 2nd £50, 3rd £25; class 3, for the best design and specification for a detached cottage to cost not more than £180, 1st £10, 2nd £5; class 4, for the best design and specification for a pair of cottages to cost not more than £350, 1st £10, 2nd £5; class 5, for the best laid-out garden, 1st £10, 2nd £5. Applications for plots must be made to the Estate Office, Fleetwood, before March 1st next, and all buildings must be completed by June 14th next. All plans and sections must be approved by the Thornton Urban District Council before any of the buildings are commenced. Diplomas will be awarded for the best exhibits in the various trades connected with the building and furnishing of cottages in classes 1 and 2.

At the new Aldwych Theatre—at the corner of Aldwych and Kingsway—Mr. Albert Toft's statue of "The Spirit of Contemplation" is set up in the foyer.

Mr. George Waymouth, F.R.I.B.A., has moved from 23, Moorgate Street, E.C., to Raymond House, Theobald's Road, Gray's Inn, W.C. Telephone No. 4867 as before.

New Highway Offices for the Leeds Corporation have been erected in Kirkstall Road by Messrs. Charles Myers & Sons, of Woodhouse, from designs by Mr. W. Bruce, of Leeds.

The Charing Cross Station Roof Contract has been secured by Messrs. Handyside & Co., engineers, of Derby and London. The new roof will be of the ridge and furrow type, at a considerably lower level than the present roof. Gigantic travelling stages will be used to remove the existing roof. The station is expected to be re-opened in March next.

The Victoria Memorial Hall.—During his visit to Calcutta the Prince of Wales will lay the foundation-stone of the Victoria Memorial Hall, of which a model and large coloured perspective were shown at last year's Academy exhibition. Sir William Emerson is the architect. The building is to be built of white marble with a delicate blue vein, and its dome, rising 160ft. above the plain, will form a beacon to all approaching Calcutta. The cost of the building will necessarily be great, but the generosity of India is equal to the demand for funds. Already nearly £400,000 has been subscribed.

The Manchester Building Trades' Exhibition is to be held in St. James's Hall, Manchester, from April 25th to May 5th next. It will be conducted on the lines inaugurated at other trade exhibitions four years ago at Manchester, namely, that every likely buyer will receive an invitation with free ticket direct from the management, and the exhibitors will form the Exhibition Committee. No gold medals or diplomas will be given. Entries are now being booked. All enquiries should be addressed to the manager, Mr. W. Cawood, at St. James's Hall, Manchester (London representative: Mr. W. A. Carson, 173, Fleet Street, E.C.).

A new Town Hall for Lancaster.—The Lancaster Corporation have selected Mr. E. W. Mountford, of London, to be the architect of the new town hall which Lord Ashton has promised to build as a gift to the community. The new town hall will be in Renaissance style, with a pillared portico, and will stand in Dalton Square. All the corporation departments will be housed in it, and in addition there will be a police court, a banqueting hall, and a public hall for meetings, to seat 2,000 persons. Opposite the building a space has been cleared for a statue of the late Queen Victoria, to cost over £10,000, given by Lord Ashton, while in the park (which was given to the town by his father) Lord Ashton is erecting an ornamental structure at a cost of £30,000.

"Unfading" Green Slates.—Mr. Louis Ambler, F.R.I.B.A., at a recent meeting of the Architectural Association Discussion Section, said "Eureka" slates were thin compared with Westmoreland green slates, and were said to lose their colour. The Association Journal reported him to say "they lose their colour and are very thin." Messrs. Roberts, Adlard & Co., the sole agents for the Eureka slates, wrote to him pointing out that the slates were not as thin as ordinary Welsh slates, and could be supplied as thick as Westmoreland if specially ordered, and that the reputation which they had of losing their colour was not justified and that they could in circumstances give a reasonable guarantee. Mr. Ambler now states that he has since at their request inspected some roofs where the "Eureka" slates were used several years ago, and has found that they

This design by Mr. T. Gibbon was submitted in one of last year's competitions for public libraries at Glasgow. The elevation was intended to be carried out in Portland stone and brick. The drawing reproduced above was exhibited at last year's Academy.

have retained their colour to a reasonable extent. As architects occasionally require to substitute a cheaper and lighter green slate for the Westmoreland specified, this correction by Mr. Ambler of the erroneous impression prevailing in some quarters is useful.

An Article on Garden Villages, Cities and Suburbs, by Mr. Hugh B. Philpott, appears in "Cassell's Magazine" for this month, illustrated by a number of sketches of Bournville, Letchworth and Port Sunlight.

New Public Library, Northfield, Birmingham.—The joint architects for this new library, the tenders for which were given on p. xxxvi of our issue for last week, are Messrs. Bateman & Bateman and Alfred Hale, whose design was selected in competition.

Work in the Colonies.—The January circular of the Emigrants' Information Office, 31, Broadway, Westminster, has just been issued. From this it appears that New Zealand is the only colony which at the present time offers secure employment for competent building-trade workmen. The supply to the other colonies is already full, though the labour market and the demand for men has improved in Cape Colony.

Floor Vibration.—Mr. James Thomson, the Dundee city architect, has been investigating the cause of vibration in the floors of the Dundee Sculpture Gallery and small adjoining room. He has discovered that this is occasioned by the earth underneath, on which the sleeper walls supporting the joists were founded, being partly undermined by recent underpinning operations, so that it has shrunk, leaving the joists suspended. The floor will now be supported by steel columns and beams. From an architectural point of view the Free Library and Sculpture Gallery are curios in respect that they have not been provided with storage accommodation. Neither Sir Gilbert Scott, R.A., who erected the first portion, nor Mr. Mackenzie, who designed the Gallery, provided for storage. This is now to be arranged for by Mr. Thomson.

Correspondence.

The "Tom Tower" at Christchurch College, Oxford.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Mr. C. T. Armstrong's pleasant drawing of this tower in your issue for November 29th, recalls to mind that "Great Tom," described as being hung in the upper stage of the tower but brought formerly from Osney Abbey, is the largest old bell in England. Is this so? The heaviest ringing peal in Great Britain (although I regret to say comparatively very seldom heard) is in the south tower—Norman—of Exeter Cathedral. There are eleven bells, and their united weight is 258 cwt. 1 qr. 17 lbs. The great bell, known locally as "Peter," hangs by itself in majestic isolation in the north tower. Both these massive towers were built by the blind Bishop William Warelwast, a nephew of the Conqueror (A.D. 1107-36), and this particular bell claims to be the second largest old one in this country. It was formerly at Llandaff Cathedral, but Bishop Courtenay, who (A.D. 1478-85) raised both towers, adding battlements and pinnacles to them, exchanged some smaller bells for it, brought his prize to Exeter, and hung it where it now is. Upon it the curfew has tolled the knell of parting day every night at eight from that period until now. Common report has long had it that its weight is 12,000 lbs., i.e., more than 107 cwt., but Messrs. John Taylor

& Co., of Loughborough, who overhauled the bells in the southern tower recently, tell me they do not estimate it at more than 80 cwt.—a very considerable difference. Yours truly,
HARRY HEMS.
EXETER.

Trade and Craft.

Pencils for Architects and Builders.

We have received from Messrs. L. & C. Hardtmuth, of 15, Ludgate Hill, E.C., some samples of their well-known "Koh-i-Noor" pencils. These are the best pencils with which we are acquainted. They are obtainable in seventeen different degrees, ranging from very soft to very hard leads. We have always found the leads of these pencils to be of perfectly regular quality from end to end, and enclosed in wood which does not break away. Though they are, comparatively speaking, somewhat expensive pencils, we think that the excellence with which they last, warrants the additional cost. Besides being obtainable in the usual hexagonal and round forms, Messrs. Hardtmuth now supply them in screw-holders for the pocket. Like the pencils themselves, these holders are finished in the best possible manner and will be found of the greatest service.

Air-Purifying Apparatus.

Mr. G. Dubuis, of 26, Hugh Street, Eccleston Square, S.W., has invented and placed on the market an apparatus for purifying, disinfecting, aromatizing, cooling and warming air, which should be of service to many architects. It is adaptable for all kinds of buildings, especially for hotels, hospitals and similar buildings, and has been proved by analysts of the Charing Cross School of Medicine to be very effective in ridding air of carbonic acid, having in this particular test been found to reduce to 49 air charged with 26.6 of carbonic acid. It has also been awarded a gold medal at the Tuberculosis Exhibition held at Paris. Full particulars can be obtained from Mr. Dubuis at the address given above.

INDIAN ARCHITECTURE.

IN an article in the "Manchester Guardian" under this heading, "F. M. S." (? Professor Simpson) says:—

In Indian architecture the buildings of some races are all lintelled, whilst others are arched and domed. "An arch never sleeps," says the Hindu proverb, and the Hindu, therefore, doubts its stability and leaves it severely alone.

How the Hindu Builds.

He spans his openings by beams — by a single one if the space be narrow, by many if it be of considerable width. In the latter case the beams are placed one on top of another, and each in turn projects in front of the next below, like a bracket. He does not object to the shape of the arch, or at all events he did not in the past. On the contrary, he used the form frequently when building in stone. But his arch is not a true arch. He laid his stones, as he laid his beams, horizontally. In the north of India there are many Hindu domes, and one would have thought that these would have been built as the Byzantines built them and as we build them now. But no: the same principle of beam on top of beam—in this case they cross one another, generally diagonally—is followed, until the opening at the top is sufficiently small to be closed by a single piece of stone.

How the Mahometan Builds.

The Mahometans built quite differently. A mosque was not a mosque, a tomb not a tomb, unless it had an arch in it. For some time they were dependent on Hindu labour, and their arches, although of Saracenic form, are built in Hindu fashion. But about the middle of the fifteenth century they learnt to build more correctly, and many of their subsequent arched openings are amongst the largest and finest in existence. Moreover, they built domes which can hold their own with any in Europe. The dome over the tomb of Mahmūd at Bijapur is 135ft. in diameter, practically the same width as the dome of Florence Cathedral. But the Florentine dome and the wall below it are the same in plan, octagonal, whereas the Indian dome is a circular one placed above a square. The difficulties of construction were thus increased enormously, and the manner in which they were overcome is both beautiful and ingenious.

Indian Pyramids and Rock Halls.

Amongst the oldest and largest of the very early buildings of the country are the domical pyramids or topes and the caves or halls excavated in the rock. The former may not rival the pyramids of Memphis in size, nor the latter the rock-cut tombs of Thebes in extent, but they are nevertheless of great interest. The finest of the caves is at Karli, between Bombay and Poonah. In plan it resembles an early Christian church, as, besides being divided into nave and aisles by columns, it finishes at one end with an apse and ambulatory, whilst at the entrance the side columns are returned across to form an inner narthex, as in S. Agnese, Rome. The date when it was excavated is said to be B.C. 78.

The Mystery about Greek Forms.

How Greek ornamentation—the acanthus leaf and other Greek forms—found its way into India probably never be known for a certainty. Perhaps from small carvings, in the same way as Byzantine ivories influenced the sculpture in the South of France, especially in and around Toulouse. Other foreign influences entered as well. At Allahabad is the Assyrian "honeysuckle," carved round one of the tall, slender, circular obelisks, or lāts. But the most curious examples of all are a number of pseudo-Corinthian capitals, some of which are now in the Museum at Lahore. They are not exactly like any known series of Greek, Roman or Byzantine capitals, and yet they

must have been inspired by European work. They remind one somewhat of the capitals at Philæ, carved in Ptolemaic times, after Egypt had been conquered by Greece.

THE OPPORTUNITY IN THE STRAND.

THE announcement that three syndicates are negotiating for the middle building site between Aldwych and the Strand, and that the Improvements Committee of the London County Council are about to make a recommendation thereon, gives the Further Strand Improvement Committee occasion to make another effort to secure the setting-back of the present building line.

Between the two churches, the north side of the Strand, instead of being planned so as to give the roadway its natural course direct to the Courts of Justice, deviates about 60ft. towards the south, thus forming a barrier between the portions of the Strand east and west thereof. Thus, when buildings are erected on the site they will obliterate from the west the view of the Courts of Justice and the church of St. Clement Danes, and from the east that of the church of St. Mary-le-Strand, and being at an angle encroaching upon the latter church, the buildings will mar the beautiful aspect of St. Mary's from where-soever viewed.

The Committee fully appreciate the wish of the Council to save public money, but at the same time they urge that there are overwhelming reasons why so great an advantage as this further improvement should be secured whilst the opportunity offers. In this they have the support of the Royal Institute of British Architects and many eminent architects, painters and sculptors.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Cesspool in Running Sand.

ORMSKIRK.—T. R. writes: "How can I deal with a cesspool built in running sand? Water finds its way in at one or two points, despite a coating of best cement. Would a coating of boiling pitch be likely to stop up the places? The outside of the tank has 6ft. of puddled clay around it."

You will find it practically impossible to prevent the water getting into the cesspool as it exists at present. Boiling pitch would not be likely to adhere to the damp brickwork, and so would prove useless. The most effective method of dealing with running sand is drainage; but this would probably end in letting down the tank. Our only suggestion is to improve the puddle backing, which should surround the entire tank. Increase the thickness of it, and use only good stuff, worked before using to the consistency of putty, and put it in in thin courses well trodden down.

St. Albans Abbey.

EXETER.—MR. HARRY HEMS writes: "Referring to the reply to an enquiry about the above on p. 328 of your issue for December 6th, your correspondent 'H. Y. M.' is perfectly correct in his remark that an excellently illustrated little book by the Rev. Thomas Perkins, M.A., entitled 'The Cathedral Church of St. Albans,' has been published by Messrs. George Bell

& Sons. Unfortunately, however, it is weak on the very subject your enquirer 'H.' writes upon, *i.e.*, the high altar screen. The illustration of the latter, therein entitled 'The Wallingford Screen,' only shows the latter during the process of renovation, and minus the great central figure; hence it does not represent it as it now is. The completed work was renovated, however, upon All Saints' Day (November 1st), 1899, the late Sir Arthur Blomfield having been the architect for the restoration. The statues (there are eighty-five, all told) are of yellow magnesium limestone (Mansfield), excepting the thirteen statuettes immediately over the altar, which are in pure white alabaster. The great central figure of the Crucified Christ measures 8ft. gins., and is not only the largest representation of its kind in stone in this country, but was carved out of the biggest block ever raised in the celebrated Mansfield quarries. The whole of these statues were carried out in my studios. The only book in existence—so far as I am aware—that fully describes the screen and its statues is 'An Account of the High Altar Screen in the Cathedral Church of Saint Albans,' by Mr. Henry Hicks Gibbs (now Lord Aldenham). It was published by Gibbs & Bamford, Market Place, St. Albans."

Reinforced-concrete Lintels.

CATFORD.—H. L. B. writes: "Referring to Prof. Adams's reply to 'A. W. D.' on p. 341 of your issue for December 13th, the formula should read thus:—

$$\frac{nf_e}{b} \left[\sqrt{1 + \frac{2b(h-a)}{nf_e}} - 1 \right]$$

and not as shown, thus:—

$$\frac{nf_e}{b} \left[\sqrt{1 + \frac{2b(h-a)}{nf_e}} - 1 \right]."$$

Determining Section of Rolled Joist and Stanchion.

LEWES.—FELSPAR writes: "A rolled steel joist is to carry a distributed weight of 9 tons over a span of 18ft., and is to be supported at the ends by two steel stanchions of I-section 10ft. high. Please show how a suitable section for the joist and stanchion is calculated; also what regulates the thickness of metal in relation to the depth and width of the joist." This is an examination question which I have been unable to solve without the use of manufacturers' tables."

This being an examination question and no manufacturers' tables being allowed, it may be worked as follows:—The mean depth of joist in inches may be assumed as half the span in feet = $\frac{18}{2}$ = gins. Then the stress in

flange is given by the formula $\frac{wl}{8d}$, where w

= load in tons, distributed = 9, l = span 18ft., and d = mean depth, both being in the same

units. Then $\frac{wl}{8d} = \frac{9 \times 18}{8 \times \frac{9}{12}} = 27$ tons stress in

each flange. Allowing $6\frac{1}{2}$ tons per sq. in. for steel, the area required will be $\frac{27}{6\frac{1}{2}} = \text{say } 4\cdot25$

sq. ins., requiring a flange 6ins. $\times \frac{3}{4}$ in. Then the total depth of joist will be, say, 10ins. and the thickness of web, say, $\frac{1}{2}$ in. The weight in lbs. per ft. run is approximately $3\frac{1}{2} \times \text{area sq. in.}$, which in the present case = $3\frac{1}{2} \times 13\cdot25 = \text{say, } 45$ lbs. Then the joist will be 10ins. by 6ins. by 45 lbs. The total weight to be carried by stanchion = $\frac{1}{2}$ load

+ $\frac{1}{2}$ weight of girder = $\frac{9 + 36}{2} = 4\cdot68$ tons,

say 5 tons. Then the section of stanchion must first be assumed, say, 4ins. \times 3ins. r.s.j.; web thickness, say $\frac{3}{4}$ in.; and flange thickness say $\frac{1}{2}$ in.; giving the weight = $3\frac{1}{2} \times 4\cdot125 = \text{say } 14$ lbs. per ft. run. Now the safe load on mild steel stanchions 30-40 diameters long, as in the section assumed, is approximately $2\frac{1}{2}$ tons per sq. in. Then the area required =

$\frac{5}{2.5}$ = say 2 sq. ins., so that the section assumed, 4ins. by 3ins. by 14 lbs. r.s.j., will be more than enough, but a smaller section could hardly be used. The thickness of metal in the flanges is regulated by the amount of stress in the flange, and the thickness of web by the buckling and shearing stresses. Checking this by reference to catalogue, it is found that Dorman, Long & Co.'s *G 9, 10 x 6 x 45 lb. r.s.j. is the nearest section to carry the load, and for the stanchion, 10ft. high, Dorman, Long & Co.'s G 28, 4 x 3 x 12 lbs. is the section required. HENRY ADAMS.

Land Development.

WALLASEY.—T. T. writes: "A and B are separate owners. A wishes to develop his land with the aid of B, i.e., to convert it from agricultural into building land, the district being a suburban one. A has approached B.

He cannot develop without getting through B's land. B has an occupation lane across the railway for agricultural access, but cannot sewer that way. Is there any precedent for B to negotiate upon? B does not wish to purchase A's land. Directly A gets through he naturally becomes B's competitor in the building market."

B is of course master of the situation, and may if he so chose refuse to allow A to have any access through his property. If B desires to negotiate with A, I suggest that the latter should purchase from B a strip of land wide enough for access, say 36ft. wide, and should metal and sewer the new roadway, B of course reserving the right to use the road for all purposes and to connect with the sewer. It may answer B's purpose to give A easier terms than the above on condition that A gives him access to his other land, which appears to be beyond A's property; this, however, can only be settled by someone having actual knowledge of the land and its capabilities. F. S. I.

Tramway Stations and Works.

YOR writes: "I was much interested in your correspondent's description of the new mills at Manchester on p. 299 of your issue for November 22nd. Have illustrations, &c., been published of the tramway power station at Bristol and the Dolphin Works, Portslade, Brighton?"

We can find no trace of such illustrations having been published.

Dorchester House; Almshouses.

LONDON.—H. P. writes: "(1) Have any drawings or views of the interior of Dorchester House been published? (2) Where are the best modern and ancient private almshouses to be seen? Have any works or papers been published on this subject?"

(1) No detail drawings of Dorchester House appear to have ever been published. Good descriptions of this building are to be found in such works as Walford's "Old and New London" or Prickett's "History of Highbury." These works also contain woodcuts, which however are so lacking in detail as to be unworthy of publication. (2) There is no book devoted entirely to the subject of almshouses, but numerous illustrations of this class of building may be found in publications such as Dolman and Jobbin's "Analysis

of Domestic Architecture in Great Britain," "The Spring Gardens Sketch Book," and "The A.A. Sketch Book." A list of London almshouses will be found in Herbert Fry's "Royal Guide to the London Charities," published by Chatto & Windus, 111, St. Martin's Lane, 1906, price 1s. 6d., or a complete list of English almshouses will be found in the somewhat bulky volume, "The Charities Digest and Register," by C. S. Loch, published by Longmans, Green & Co., Paternoster Row. H. Y. M.

Mahometan Architecture; A.A. Sketches.

YOR writes: "(1) Have Mr. Phéne Spiers's lectures on Mahometan architecture been published? (2) Are the sketches made with the A.A. excursion first done roughly in pencil and afterwards inked in for publication?"

(1) Yes. With many other lectures these were published last year by Mr. B. T. Batsford, 94, High Holborn, in a book called "Architecture, East and West," with further illustrations forming part of a testimonial to the author. (2) The sketches made with the A.A. excursions are sometimes finished upon the spot and sometimes worked up carefully in ink, pencil or other material afterwards. This depends upon the skill, rapidity or taste of the individual artists. H. Y. M.

Drains to Four Houses.

STEVENAGE.—RAT writes: "I have bought four plots of land in a corner of an estate on which to build four cottages. The drains of these cottages I proposed to join into the main sewer, but the local authority stipulate a drain from each house into the main sewer, so that from the point A on accompanying sketch (not reproduced) I should have to take four 4in. drains to point c and make four connections into the sewer. Can the local authority enforce this? They have no by-law to this effect. Their point is that in the event of the drain going wrong it would be a public sewer, and that they would then be liable for its maintenance. Provided the drain is in accordance with the by-laws as regards size, can I be compelled to put in four drains? What should I do in the matter?"

The local authority has power to permit the drainage of several houses in one ownership by a combined drain such as you propose. They would, however, safeguard themselves by agreement or otherwise and bind the owner and his successors in title to regard such a drain as a private drain not repairable by the authority. An owner cannot, however, compel the authority to come to such an arrangement. But the authority may compel the owner to provide a separate drain for each house, though only semi-detached or forming part of a block constituting only one building. (Woodford U.D.C. v. Stark (1902), 18 T.L.R. 439.)

Tenants' Fixtures.

STOURBRIDGE.—ANXIOUS writes: "I have just let a shop at £45 yearly and a further rent of £10 for the use of certain fixtures in the shop. In the tenancy agreement is the following clause: 'And it is hereby further agreed that it shall be lawful for the tenant at any time before the 8th day of December, 1906, to purchase the said fixtures and fittings at or for the price or sum of £150, and upon payment of the said purchase money of £150 and of all rent hereby reserved up to the time of such payment the said fixtures and fittings shall belong to and be the property of the tenant.' (1) Can I, in addition to the usual 5 per cent. on the £45 and £10, charge a further sum equal to 5 per cent. on the £150 for which the fixtures were agreed to be sold? or (2) should I charge 5 per cent. for letting the house only, at £45, and 5 per cent. for fixtures? or (3) should I charge now only for letting the house and fixtures, and advise the owners that if the tenant purchases the

fixtures I shall have a further charge? (4) Does the wording of the clause given amount to a definite agreement to purchase, or does it only give the tenant the option to purchase? I have had all the negotiations in the matter, except that a list of fixtures was supplied by the owner, through me, to the tenant. I did not prepare the list."

(1) I am of opinion that you should not charge any commission upon the £150 for fixtures. (2) The correct charge would be at the rate of 5 per cent. upon the £45 house rent and also upon the £10 fixture rent. There may also be small fees due to you for drawing up the agreement, out-of-pocket expenses, &c. (3) I do not advise this course. (4) The clause, as quoted, merely gives the tenant the option of purchasing, if he so chose, at any date prior to December 8th, 1906. F. S. I.

Porous Brickwork.

MIDLANDS writes: "Is there any remedy for porous bricks? These are covered externally with stucco. The building is five years old, and internal damp has only lately showed itself. It is important to use some preparation which will not materially change the colour, as this new part is an addition to a very old house."

We should like more detailed information, because it is doubtful if the dampness is not caused by a leaky roof, choked or damaged gutter and down pipes, and want of a proper damp-course. If, however, the trouble is really caused by porous bricks, the wall would be best vertically tiled or slated on battens; or Portland cement and sand plastering, trowelled, might be sufficient; while finally the outside might be tarred, although the appearance would not be good.

Building Line.

ARCH writes: "The urban district council will not pass the accompanying plan unless the building is set back as indicated by dotted lines. Considering that there is already a building on the site A in a line with proposed new building, and the wood and iron room on the north side (B) has been

in existence more than twenty years, can they compel my client to set back his building to the dotted line? The plans have the approval of the owner of the adjoining property."

Unless the erection B is of really so inconsequent a character as not to justify its description as "a building," the urban district council are wrongly interpreting section 3 of the Public Health (Buildings in Streets) Act, 1888. It may serve a useful purpose to draw the surveyor's attention to the fact that that section definitely states that the building line is to be drawn between "the front main wall of the house or building on either side thereof in the same street." The fact that the iron building could not be erected under the present by-laws has nothing to do with the question, nor has the period of time during which it has occupied the ground. The building is there and cannot be ignored. F. S. I.

CARRON

ARTISTIC FIREPLACES.

CARRON Company manufacture Fireplaces in designs Modern and Antique, Plain and Ornate, to harmonise with any scheme of Room Decoration. Some of these Grates are creations of eminent artists who worked at Carron over a century ago.

Illustration shows No. 2 Suite, the interior hob grate of which is of XVIIIth Century design. The fender, fire-irons, and rests are in keeping, and, like the grate, are finished in armour bright, while the tiles harmonise with the whole, making a very imposing fireplace.

May be inspected at the Company's various Showrooms.

Write for Catalogues.

CARRON COMPANY.

(Incorporated by Royal Charter, 1773.)

WORKS—CARRON, STIRLINGSHIRE.

AGENCIES & SHOWROOMS:—LONDON (City)—15, Upper Thames Street, E.C.; LONDON (West End)—23, Princes Street, Cavendish Square, W.; LIVERPOOL—30, Red Cross Street; MANCHESTER—24, Brazennose Street; BRISTOL—10, Victoria Street; NEWCASTLE-ON-TYNE—13, Prudhoe Street; GLASGOW—125, Buchanan Street; BIRMINGHAM—Goldhall Buildings, Stephenson Street; DUBLIN—44, Grafton Street; SOUTHAMPTON—Town Quay (The Old French Prison).

Electrical Notes.

The Uses of Electricity in Modern Buildings.

Despite the fact that this is pre-eminently the day of the specialist, and that in the erection of buildings the various trades are each taken up by their own special workers, to whom essential details are left, in the matter of electric installations in houses it is necessary for the architect to be at least cognizant of the main requirements, and to know what is and what is not good practice. In this connection it is interesting to note the lecture on "The Uses of Electricity in Modern Buildings" which Mr. S. E. Fedden, A.M.I.C.E., general manager of the Sheffield Corporation Electric Supply Department, delivered before the last meeting of the Sheffield Society of Architects and Surveyors.

In the course of this lecture Mr. Fedden dealt with electric lighting, cooking, heating and ventilating. Speaking of lighting by electricity, he remarked that it paid the consumer to purchase a good incandescent lamp, which had many advantages over a cheaper second-rate article. For effective illumination, lamps should be hung so as to be easily avoided by the eye. The amount of light required to produce a satisfactory illumination could not easily be stated by any particular rule. Although shades stopped some of the light emitted by the lamp, they tended to greatly heighten the illuminating effect by shielding the eye from the direct rays, and thus allowing the pupil to open to greater extent. In the arrangements of the lights and switches lay the greatest possibility of economy in the use of electricity, and it would pay every intending consumer to consult his architect on the matter. Mr. Fedden proceeded to show how the electrical installation should

be placed in the various rooms of an ordinary dwelling-house, detailing the varying positions for the lamps in the different rooms. He then went on to speak of electricity as used in heating and cooking. Apart from its many other great advantages, the cost of electrical cooking was extremely low. The cost of heating one pint of water to boiling point was approximately one-fifteenth of a penny. The time taken to cook food varied very much with the food, but a kettle giving 90 per cent. efficiency and taking half a unit per hour would raise $1\frac{1}{2}$ pints of water from 60° degs. Fahr. to boiling-point in twelve minutes.

The heating of rooms and buildings could be accomplished by either radiant or convected heat. With the former method heating was effected by the agency of glow lamps, and with the latter method by resistances working at comparatively low temperatures. The difference between the two methods of heating was a very wide one, the best method to employ depending entirely on the nature of the work for which the heaters were required. It was necessary in deciding which type of heater would give the most satisfactory result to know the purpose for which it was to be used and the conditions under which it would work. The glow lamp was suitable for use out of doors and in balconies, owing to the heat being unaffected by air currents. Heating by electricity was not costly, the estimated cost of burning a four-lamp heater being 1d. per hour. Electric stoves possessed great advantages over both coal and gas. They were very suitable for chimneys which had down-draughts and for places where it was impossible to have flues, whilst for bedrooms and sick rooms the electric stove was practically indispensable.

The question of electric ventilating had received much attention from architects. For this purpose electric fans were eminently

suited, owing to the ease with which they could be fixed to run in any position, and the little attention they required. They were now being largely used in all classes of workshops and factories. Electrically-worked elevators promised soon to displace every other form, being economical to work, and reliable. Mr. Fedden proceeded to quote figures showing the saving effected in the cost of running suitable machinery by electricity as against coal, and concluded by hoping that when his audience heard the oft-repeated statement that electricity was in its infancy but would be the power of the future, they would think of the many uses to which it was put at the present time.

The Paris Metropolitan.

In the north-west of Paris a new power station has been built for the needs of the Metropolitan Railway. The plant installed consists of three Brown-Boveri-Parsons turbo-alternator groups of 5,000 kilowatts; 25-cycle, 5,500 volts, three-phase; one ditto ditto, 3,000 kilowatts; two turbo-exciter groups; and one motor-generator group of 250 kilowatts. On the Metropolitan No. 1 line new double-truck cars with rounded ends have been placed. These have each a total capacity for seventy-five passengers, with seats for forty-six. The floor is of iron. Visitors to Paris who have not been about the city since the introduction of this underground railway will find it of the greatest convenience—even more so than the London "tube." They will also be struck with the large size of the tunnels and the very brief stops which are made at the stations, leaving one only the smallest interval for getting in or out; but the arrangement of sliding doors near the ends of the cars will be found to be nothing like so good as the gates on the London "tube" cars, which, too, are more comfortable to travel in.

Specification for Tar-paving.

KETTERING.—F. A. H. writes: "Please give me a good standard specification for tar-paving to a schoolyard."

See the Municipal Engineers' Specification, price 2s. 6d. (3s. post free) from our offices.

Building in the Colonies.

J. C. writes: "Kindly name books or publications suitable for building or architecture in the Colonies. I believe I saw a series of articles some years ago on 'Woodwork for Colonists.' Where one is forced principally to the use of timber in construction it follows of necessity that our methods here, as well as designs, have to be modified. Works on water-storage, sewage-disposal, roads and streets for Colonial purposes would be helpful. I have 'Specification for Municipal Engineers,' and an excellent compilation it is."

"Specification No. 8" (price 2s. 6d. nett, or 3s. 3d. post free from our offices), Rivington's "Notes on Building Construction," 4 vols.; the "American House Carpenter," by R. G. Hatfield; "Farm Buildings," by A. Dudley-Clarke; and "Civil Engineering," by L. G. Vernon Harcourt. The prices can be obtained from our "Book Lists."

Honours, Building Construction Examination.

LYTHAM.—CONSTRUCTION writes: "Please give me a list of books necessary to study for Honours, Building Construction."

See our "Book Lists" for works on the various subjects required to be studied. As regards general instruction books, we recommend Rivington's "Notes on Building Construction," "Specification," Goodman's "Mechanics applied to Engineering."

THE BUILDING TRADE IN 1905.

THE following reports on the state of the building trades in various centres during the past year have come to hand:—

England.

Bradford.—Building operations are stated to have been never so depressed in modern times.

Halifax.—Here also the trade has been depressed, and many men are out of work. A considerable amount of tenement property is unlet, and not much speculative building of house is going on, but it is expected that there will be more activity this year.

Harrogate.—A fair amount of medium and cottage property has been built in this popular watering-place. About 1,000 houses have been built since 1901, and about 125 of these last year. There are brighter prospects for this year.

Huddersfield.—A good number of cottages and middle-class houses have been put up in this district. A few new mills and weaving sheds have also been erected, and extensions of mills have been carried out in Huddersfield and the Colne and Holme valleys. It is probable, however, that but for the extensive buildings that are being erected at the West Riding Asylum at Storthes Hall, short time would have to be resorted to.

Hull.—Many men are out of work, and the amount of unlet tenement property is a disquieting feature of the situation. Good progress is being made with the new law courts, and the second portion of the new city hall is well advanced.

Leeds.—In this centre the past year has been uneventful. A few large schools have been completed or commenced, but big schemes of any kind are very scarce; the most important being the new sewage scheme which the Corporation has just decided upon. The large number of empty houses does not encourage speculative building. This year is, however, anticipated to be an improvement.

Manchester.—Several housing schemes have had the attention of the Manchester city architect's department during the year. Buildings have been erected in Rochdale Road providing accommodation for sixty-four families in tenements of two and three rooms. The Parks and Cemeteries Committee has had a fairly busy year in the matter of builders' work, notably in Heaton Park, erecting a new tea-room, rustic shelters and other structures. The Markets Committee has carried out two large painting contracts. At the Foreign Animals Wharf a large extension is approaching completion which gives accommodation for 600 additional head of cattle. A new slaughter-house and an addition to the cooling-room have been included in the operations. At Whitworth Street West a gas-meter testing depot is now constructed. Victoria Baths have been brought near completion. The Moss Side baths are well in hand. At Monsall a new mortuary and disinfecting station have been added. Of the buildings now in progress for the Manchester Corporation the largest and most important is the new Central Fire Station, near London Road Station. The building has reached the roof, but the undertaking is so large that another year must elapse before the premises are sufficiently furnished and equipped to be devoted to their purpose. The building is the design of Messrs. Willoughby, Woodhouse & Langham, joint architects, and its erection is in the hands of Messrs. Gerrard, builders, Swinton.

Sheffield.—The year has been a bad one, but the outlook is not altogether gloomy. Building is still keeping in front of the demand by tenants. Opinions as to the condition of the cottage property market are conflicting. One has it that it has not been so bad in Sheffield for many years; another holds that there are not quite the number of empty houses that there were a year or even two years ago, because fewer cottages have been built. The City Buildings Inspector and his staff have been fairly busy, but they have not had so much to do as in 1904. There has been a marked decrease in the number of plans deposited. In 1904 there were 1,530, but last year up to December 20th there were only 1,288. Of these 974 have been approved, as compared with 1,093 in 1904. Sanctioned on these plans were 2,076 houses—451 fewer than twelve months ago. Plans have been approved for 661 buildings of a general description. Here, again, the decrease is considerable, since in 1904 777 general buildings were erected. A large number of dangerous structures have been dealt with, and a good deal of attention has been paid to the means of exit from various public buildings and workshops. There have been comparatively few large and important buildings completed during the year. First and foremost is the University.

Scotland.

The past year has not been prosperous for the Aberdeen building trade. The revival that is taking place in the general industry of the country has not yet begun to make itself felt in this particular trade. The number of plans passed by the town council during the year is the smallest that has been before them for about fifteen years, so that unless a very decided change for the better is experienced during this year it is probable that the builders of Aberdeen will have another twelve months of dull trade to look forward to. The most important mason-work contract that has been completed during the year is the Marischal College extension. A considerable amount of work has yet to be done before the premises are ready for use—practically all the inside work has yet to be accomplished—but the actual building is finished. It may very well be that the general granite industry of Aberdeen will

benefit considerably from the advertisement which it will receive in September next, when the University extension will be opened by His Majesty the King in the presence of a large company of distinguished men from all parts of the world. Another large job which has been completed during the year is Sunybank School, built by the Aberdeen School Board, and the new post-office comes into the category of buildings on which the work of the mason is finished. Substantial progress has been made during the year with the erection of the new theatre. The number of plans passed by the borough surveyor's department is as follows:—

	No. of plans.	Estimated value.
New dwelling-houses	178	£139,155
Alterations on dwelling-houses and business premises	70	18,720
New business premises, fish-curing sheds, workshops, stables, &c.	28	29,007
Public buildings and institutions, including alterations on same	11	31,255
Shop fronts, sheds, outhouses, and sanitary alterations sanctioned by the burgh surveyor	132	5,541
	419	223,681

It may be of interest to note that of all the buildings erected in Aberdeen during the year 33 per cent. were self-contained, 41 per cent. were buildings for two tenants, and 26 per cent. were tenement houses.

The building boom reached its height in 1898, when 747 plans were passed of an estimated value of £514,013. A decrease occurred in 1899, the plans passed numbering 616; in 1900 and 1901 they were about 500; in 1902 and 1903 the plans numbered 550 and 636 respectively, and in 1904 going back to 442.

As regards the granite industry, merchants are at present suffering from the effects of keen competition, not from abroad but among themselves. On every hand are heard complaints as to the cutting-down of prices by a large number of firms keenly anxious to secure work in order to keep their men and machinery working fairly steady. The result of this has been that during the past two or three years work has been taken in hand at abnormally low prices and profits have shrunk practically to the irreducible minimum.

OUR PLATES.

CHRIST CHURCH, Moss Side, Manchester, was completed last year from designs by Mr. W. Cecil Hardisty, F.R.I.B.A., of Manchester. It is carried out in brick and stone, and is a good example of modern Gothic, with a feeling of bigness in the interior. The photographs do not call for extended comment.

Views and Reviews.**A Painter's Pocket-Book.**

The class of book known as the "pocket-book" is now recognized as most handy and useful, although it more often than not exceeds the dimensions suitable for carrying in the pocket. The present book, however, serves both functions. Such a work has been needed in the paint trade, and we can only wish it the ready sale which it deserves, and that this will urge the publishers and author to further efforts to add to its usefulness in future issues. The information given is very practical. There are various tables that will save time in estimating, a list of prices for painters' work, notes on the little understood science of colour mixing, a list of defects in painting and how to remedy them, an illustrated dictionary of terms used in building, &c., hints on setting-out work, &c., &c.

"The Painters' Pocket-book," by Peter Matthews. Published by John Heywood, of Deansgate and Kedgefield, Manchester, and of 23 and 30, Shoe Lane, London, price 3s.

NOTICE TO OUR SUBSCRIBERS.

THE INDEX OF "THE BUILDERS' JOURNAL."

The Title Pages and Index to any volume of "THE BUILDERS' JOURNAL" may be had free, upon application being made to the Office, Great New Street, enclosing 1d. stamp to cover postage of same.

Competitions Open.

CITY OF BIRMINGHAM.

COUNCIL HOUSE EXTENSION.

TO ARCHITECTS.

The Lord Mayor and Corporation of the City of Birmingham are desirous of EXTENDING the present MUNICIPAL BUILDINGS, and invite ARCHITECTS to submit DESIGNS for the same.

Sketch Plans only are required to be sent in by MARCH 31, 1906, and from those submitted a selection of not less than six nor more than ten will be made, the authors of the selected designs receiving each an honorarium of 100 guineas upon submitting complete Designs in a final competition amongst those so selected.

The Corporation has appointed Sir ASTON WEBB, R.A., and Mr. E. INGRESS BELL to act for them as their Professional Advisers in this competition.

Particulars of conditions, with Plan of Site, &c., can be obtained on the payment of One Guinea (to be returned to bona fide competitors), on application to the Town Clerk, Council House, Birmingham.

Contracts Open.

TO BUILDERS AND CONTRACTORS.

The Gas Committee of the Coventry Corporation invite TENDERS for the ERECTION at their Foleshill Works of the following buildings:—

Weigh Office (one story), 23 ft by 14 ft.

Engine and Governor Houses (one story) 24 ft. sq. and 12 ft sq. respectively.

Messroom and Stores (two stories) 62 ft. by 20 ft.

Entrance Gates and Boundary Walls.

Form of Tender, schedule of quantities, specification, and general conditions may be had from the undersigned on payment of one guinea deposit, which will be returned on receipt of bona fide Tender.

Drawings may be seen at the Gas Works.

The Committee do not bind themselves to accept the lowest or any Tender.

Tenders must be delivered, sealed, on or before first post MONDAY, JANUARY 15th, 1906, endorsed "Tender for Weigh Office, Messroom, &c.," and addressed to the CHAIRMAN of the Gas Committee, Gas Works, Coventry.

FLETCHER W. STEVENSON,

Engineer and General Manager.

Gas Works, Coventry,
December 23rd, 1905.

HANWELL URBAN DISTRICT COUNCIL.

TO CONTRACTORS AND OTHERS.

The Council are prepared to receive TENDERS for SEWERING, LEVELLING, PAVING, METALLING, FLAGGING, CHANNELLING, PROVIDING MEANS OF LIGHTING AND MAKING UP of the under-mentioned ROAD and FOOTWAYS thereof, within their district, viz:—

MANOR COURT ROAD—extending from Church Road North to "Beaumont."

The plan, sections, specification and form of Contract may be seen, and bills of estimated quantities and forms of Tender obtained, on payment of one guinea (cheques will not be accepted), which will be returned only to those persons who send in Tenders in conformity with the conditions specified, on application to the Surveyor, Mr. SIDNEY W. BARNES, Assoc. M.Inst.C.E., at the Council's Offices as under, between the hours of TEN a.m. and FIVE p.m., any day after SATURDAY, 30th DECEMBER, 1905.

Sealed Tenders to be delivered here (in envelopes supplied) not later than MONDAY, 15th January, 1906.

The Council do not bind themselves to accept the lowest or any Tender.

Any person, firm or company canvassing any member of the Council will be disqualified for receiving orders or Contracts from the Council.

By Order,

P. J. DENNIS,

Urban District Council Offices, Clerk to the Council.
Church Road West Hanwell, W.
28th December, 1905.

VOLUMES I. to XXI. of

THE BUILDERS' JOURNAL.

Handsomely bound in cloth gilt, 7/- each.

Binding Cases for any of the above Volumes can now be obtained, price 1/9 each.

THE VALUE OF OUR EMPLOYMENT REGISTER.

THIS REGISTER was commenced as a serious endeavour on our part to meet a need that is continually felt both by EMPLOYERS and EMPLOYED, and we are pleased at the practical appreciation that has been shown by our readers since THE REGISTER was first started.

Nothing is more trying than to be out of employment, but the difficulty of the position is terribly augmented when money has constantly to be paid for advertisements in order to find other occupation.

On the other hand an Employer who has just obtained an important contract most likely needs you; and has a post to fill that you are wanting, but neither of you can find each other.

THE REGISTER serves this purpose and so meets both cases. For those wanting employment it is an inexpensive means of keeping their names and qualifications before the right people, and for the Employer it is a ready means of finding just the man he wants, without delay.

We are encouraged to find how largely our columns have been instrumental in meeting the requirements of both parties in the manner indicated above, and we thank those advertisers who have written expressing their pleasure and indebtedness to THE REGISTER.

Many have found it an invaluable aid in getting appointments, and we would urge all those who are out of work, or want to change their situations, in fact, all who have a "want," to make use of these columns and thus make THE REGISTER a record of still more value to Employers and Employed.

For 3s. we give 3 insertions (four lines), in our "Appts. Wanted" Columns, and also 6 insertions in the "EMPLOYMENT REGISTER" (see page xx).

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending December 29th nine failures in the building and timber trades in England and Wales were gazetted.

H. SARGENT, builder, Forest Gate. Adj. Dec. 20th.
J. WRIGHT, builder, &c., Bournemouth. R.O. Dec. 16th.
S. ALBONE, builder, Stevenage. R.O. Dec. 16th.
W. H. THOMPSON, painter, Cradley. R.O. Dec. 19th.
J. W. LUCAS, builder and contractor, Bournemouth. R.O. Dec. 18th.

ADDIS & Co., decorators, Hounslow (late South Kensington). Adj. Dec. 19th.

MARSHALL & Co., builders, London, W.C. R.O. Dec. 20th.

TIMSON & ADAMS, builders' merchants and contractors, Leicester. Deficiency £5,497.

HOUSTON & TEAGUE, builders, Merton and Putney. P.E., Kingston C.C., Feb. 6th, at 2.30.

J. J. DAVIES, painter and decorator, Llandilo. First meeting, O.R.'s, Carmarthen, Jan. 3rd, at 12. P.E., Carmarthen Guildhall, Jan. 10th, at 12.

Building Trade Failures in 1905.—From a statistical abstract of failures published in "Kemp's Mercantile Gazette" during the past year we learn that there were 645 failures in the building and timber trades as compared with 628 in 1904—these figures being far higher than those for any other trades, with the exception of the grocery and provision trades, in which there were 991 failures last year. The "gazetted" failures in the building and timber trades during the past five years are as follows:—

1905.	1904.	1903.	1902.	1901.
720	711	710	721	671

NATURAL ROCK ASPHALTE

(Compressed or Mastic)

For Horizontal and Vertical Damp Coursing.
For Flat Roofs, Basements and other floors.**The French Asphalte Co., Ltd.**

(ESTABLISHED 1871).

Supplies only the best material from their
own mine of St. Jean de Maréjols, com-
bined with the best workmanship.

COMPLETE SATISFACTION GIVEN TO THE LEADING ARCHITECTS.

Foreign Slates and the Tariff Question. THERE is a good deal of talk just now about the advantage to be derived from the taxation of all sorts of foreign goods, and certain politicians have said, in regard to the slate industry, that if a tax were put on French slates it would be of great assistance to the Welsh slate trade, which is certainly in a bad way at present. The same thing might be said in connection with other foreign slates—American, Norwegian and German. The idea, however, is fallacious. We say nothing about the truth of the contentions as to the advantages or otherwise of a protectionary tariff, but so far as the slate trade is concerned we do not think any particular advantage would immediately accrue from the imposition of a tariff on French slates. The slate trade feels the effect of depression in the general building trades as much as any other branch, and the present depression is due to the smaller demand. We constantly hear of the inferiority of French slates as compared with Welsh, and while this is undoubtedly true,

the point of the matter is missed, because French slates are used simply on account of their exceeding cheapness. In the production of slates, material and freight amount to very little; about 75 per cent. of the cost of production is expended on labour, and labour in France is cheap. At the same time the French quarries are of very large size, well organized, and are thus able to place on the market slates which serve for classes of work for which Welsh slates would be too expensive. Welsh slates have admittedly good qualities, but it is going a little too far to say that everyone ought to be forced to use them. To insist on this would only add to the already increased cost of building, compared to some years ago, and this would naturally restrict the demand. As regards American slates, we are now getting some very good and cheap greens from there which are suitable for purposes where Westmoreland green slates are too expensive and too thick and heavy. The American slates gained a bad name some years ago because they were exported in steamships. The vibration of the machinery, combined with the placing of the slates in the hold of the vessels (with all the other cargo on top), and the quick unloading always adopted in steamers, caused a great deal of breakage. But now that slates are sent in sailing vessels, this trouble is not so great. Norwegian slates have a rich green colour, and compete well with the American variety. German slates are not much favoured. We do not think that a 10 per cent. duty on French slates would be sufficient to keep them out, and moreover it is not apparent that any particular benefit would be derived by us from the imposition of such a tax. The building trades seem to be furnishing instances at the present moment for arguments in favour of tariff reform, but we think that the industry is not particularly serviceable in the way of examples, as it is dependent upon the general necessitous trades of the country, and of course there is very little in the nature of export to take into account, whereas in other trades the exports govern the situation.

Defective Bricklaying. We have heard somewhat too much of how American methods are so much superior to our own. The engineering profession have frightened us into imagining that whatever innovations are produced in America are necessarily improvements on the methods adopted here. Though the Americans have shown us that we often expend much more labour upon work than is required to make it efficient for its purpose, and consequently are wasteful, very often our friends across the sea overshoot the mark, and their work, in the end, is shoddy. A correspondent in one of our American contemporaries recently called attention to the bad practices current in the States, more especially in regard to brick-

work. Speaking as a practical bricklayer, he contrasted American brickwork very unfavourably with English. He pointed out that American brickwork is practically without bond. This of course is due to the tendency to depend upon steel framework for strength, and the treating of the brickwork simply as a filling-in to keep out the weather. Dependence is placed solely upon the cement and mortar, and chief attention is given to a fair face to the work. Whereas in English bond we start with a header and a 2in. bat, and at the most have three courses of stretchers to one course of headers, in the United States bricklayers start with a three-quarter-bat in a heading course and have five courses of stretchers to one course of headers. Again, where in an 18in. wall we insist upon the header on the outside being on a level with the header on the inside, in the States they do not bond their 16in. walls properly because they put the inside header two courses below the outside header. The correspondent who makes these remarks says there are very few foremen bricklayers in the States who know how to lay the various bonds in use in England. As for the ordinary American workman, he is simply driven to execute the greatest amount of work in the shortest time without any trouble about bond. He is often called upon to lay bricks in cement without wetting them in the hot summer months. All this is good enough for the time being, but depreciation goes on in the course of years; and though the brickwork may look fairly well and neat to start with, as in some cases where architects have insisted upon stretching courses only being used, in a few years the work will begin to deteriorate. We think English architects should make a special point of resisting any attempt to disregard bond. We do not say that the strongest bond should be used, but where the walls are as thin as they can be (and economy would naturally dictate this) the bonding should be fairly good. The correspondent above referred to raises another question which must not be overlooked. This concerns constructional iron and steelwork. He says that whereas in England every stanchion and column is carefully plumbed, and if not true is packed underneath with asbestos until upright, in the States all ironwork is bolted or riveted, and if not true it is racked plumb by powerful levers, which practice of course weakens the whole construction, and even then it is not always plumb. To make the stanchions plumb it would be better, however, to insist upon the steelwork being accurately made in the shops, because packing, though certainly preferable to racking into the perpendicular, renders a joint liable to give under the vibration which continually goes on. Stresses are then introduced which the steelwork was never designed to sustain, and thus serious overstrain results.

CONSTRUCTING CONCRETE ROOFS.

REINFORCED CONCRETE WORK IN INDIA.

IN this country we are now becoming accustomed to regard reinforced concrete as one of the regular methods of construction, and its use for all kinds of work—especially foundation work—gets more and more extensive as the merits of the system are more widely known. Our own methods of executing it are the same as those adopted in other European countries, but these are not universal methods, and it is interesting in this connection to turn to the accompanying photographs showing the erection of a cotton-spinning weaving mill at Bombay. In India, we may mention, the old conservatism about handwork holds exclusive sway, and as a consequence there is practically no machinery in use for building jobs: indeed, a glance at the illustrations here given is sufficient to show what very primitive methods of work are still followed by the native workmen.

The walls of the mill in question are constructed of stone, but the roof and columns are entirely of reinforced concrete. It will be observed that the concrete is carried up ladders formed by tying short pieces of bamboo across boards or uprights. The materials are transferred by hand into a

SWAN MILLS, BOMBAY.

INTERIOR OF SWAN MILLS, BOMBAY.

small receptacle—made of basket-work, earthenware, wood or metal—such as the one shown in the foreground in the view on the opposite page.]

† The mixing on this job was done in the concrete mixer shown in the view at the bottom of the opposite page, which, it will be observed, is worked by hand. The columns carrying the roof are formed of light steelwork reinforced with expanded steel and concrete. While the roofs were in course of construction these columns were protected by binding cocoanut fibre around them, as shown in the middle view on the opposite page, where also the bamboo scaffolding is to be seen. The roofs are of novel construction. They are of the saw-tooth pattern, the concrete having an average thickness of 2 ins. The view at the top of this page shows the patent centering used by the contractors, Messrs. Marsland, Price & Co., a well-known firm in Bombay. This consists of slightly curved sheet-iron sustained by rods inclined from the top flange of one longitudinal joist to the bottom flange of the

next joist. When the roof is complete these rods are withdrawn and the metal sheets so released. The roof is not constructed as one whole, but is divided into panels with a joint between the overlapping slabs so as to allow for expansion under the great heat of India. The joints are caulked with oiled paper. These joints are shown by the longitudinal lines in the above view of the completed building. These concrete slabs are reinforced with sheets of expanded steel. The trussed rafters of the roof are shown in the interior view on this page. The floor of the weaving shed is constructed in granite concrete.

It will thus be seen how all the details of a system essentially modern are carried out by Indian workmen imbued with primitive ideas but working under European direction.

RURAL BUILDING BY-LAWS.

Interesting Letter from the Local Government Board.

THE Local Government Board have sent the following letter to rural district councils throughout the country:—

Whitehall, January 5th.

Sir,—I am directed by the Local Government Board to state that it appears from a Parliamentary return which they have recently caused to be prepared relating to the by-laws with respect to new streets and buildings in force in the rural districts of England and Wales that throughout the whole of 169 and in parts of 114 rural districts by-laws are in force based on what is known as the Urban Model Series. The series is a comprehensive one, including clauses on most of the subjects upon which urban district councils are authorized under section 157 of the Public Health Act, 1875, to make by-laws.

Urban Model too Extensive.

Since the issue of this code, which was primarily intended for use in urban districts, it has been strongly urged that its adoption in districts which are of a rural character has led to interference with reasonable building operations, and the Board feel that a series of by-laws so extensive as the Urban Model is not necessary for a district or part of a district quite rural in character, where little building is going on and aggregations of population are not likely to develop in the near future. In such cases it is considered that a less elaborate code of building regulations would generally be found sufficient. In order to meet the requirements of such localities, the Board in 1901 compiled a model series of building by-laws for rural districts, dealing only with the subjects which appeared to them to be most in need of regulation and control in such districts from a sanitary point of view. This series has commended itself to rural district councils in a large number of cases, and, as appears from the Parliamentary return, by-laws of the character of this model have already been adopted throughout 106 and in parts of 32 rural districts.

Rural-Urban Districts.

The Board are aware that there are in not a few rural districts areas possessing urban characteristics or containing considerable aggregations of rapidly-growing populations for which a more comprehensive series of by-laws is desirable. Indeed, in areas of this kind the by-laws might properly and desirably approximate to those in force in urban districts. Parts of rural districts having such special circumstances can always be separately dealt with if such areas can be suitably defined. But the Board think it probable that amongst the rural districts in which the Urban Model Series is in force there are many parishes or other areas which cannot be said to have urban characteristics, and in which the by-laws in some respects impose undue restrictions on building and are more onerous than the circumstances require.

The Board are desirous that no obstacles should exist which can properly be avoided in the way of an extension of housing accommodation, whether by local authorities or private persons, and the object of this circular is to secure that whilst sanitary requirements should be strictly observed, all unnecessary impediments in the development of building should be avoided.

Assistance of Rural Councils asked for.

The Board would be glad if the rural district council would carefully review the circumstances of their district for the purpose of seeing whether any modification of the present by-laws is desirable, and whether any part of the district might more suitably be placed under a series based on the Rural Model, or, if this is not thought suitable, by

B

CONSTRUCTING FLAT CONCRETE ROOF.

SWAN MILLS, BOMBAY IN COURSE OF CONSTRUCTION.

MIXING CONCRETE AT SWAN MILLS.

such a series supplemented by a limited selection of clauses from the Urban Model. In some cases relaxation has already been given by a clause exempting detached dwelling-houses from certain of the restrictions as to the construction of walls. Even where it is considered that the full code of by-laws should be retained, the existing by-laws, unless made very recently, might with advantage be reviewed in connection with the latest form of the Urban Model. This contains many additions and modifications based on the experience of the working of the old model, and at the same time is framed so as to give more elasticity in the administration of the by-laws.

The Board wish to be informed of the result of the consideration of this letter by the rural district council, and they will be pleased to supply draft forms for use in connection with any revision of the present by-laws and to afford any information which they have at their disposal on the subject of by-laws of the kind in question.

I am, Sir, your obedient servant,
(Signed) S. B. PROVIS, Secretary.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

S.K. Examinations.

SIDMOUTH.—DOWN SOUTH writes: "What is the latest date of entry for the South Kensington examinations in architecture; also for the examination in architectural design? What are the dates of each examination? Where can I obtain the 1905 examination papers in each subject?"

The latest date of entry for the South Kensington examinations, and the date of the examinations, can be obtained from the nearest technical school or on application to the secretary, Board of Education, Secondary Division, South Kensington, S.W. The 1905 examination papers can be obtained from Messrs. Wyman & Sons, or through any bookseller, for 6d. HENRY ADAMS.

Deflection of Joists in Flat Roof.

LONDON.—R. S. J. writes: "I am rather puzzled by Professor Adams's reply about joists for Vulcanite flat roof on p. 342 of your issue for December 13th. He recommends main girders with a depth of only $\frac{3}{4}$ the span, and cross joists with a depth of only $\frac{1}{10}$ the span. I have always understood that the span should never exceed $22\frac{1}{2}$ times the depth. If there are cases in which this rule may be ignored, I shall be glad to know of them."

The span of any free rolled joist must not exceed twenty-four times the depth if the tabular loads are applied, but the span may always be increased when the load is reduced in accordance with a sliding factor of safety, namely, factor of safety = $\frac{\text{span in feet}}{\text{depth in feet}} \times 0.287$. For further information on this point see "Designing Ironwork," 2nd Series, part 4. In the case referred to, the load per foot super. was assumed at 28 lbs., which would apparently be high for the class of roof, and the size of rolled joist (12 ins. by 5 ins. by 32 lbs.) was stated to be the minimum. With this load the deflection in the centre would be about 2 ins., but if the load were taken as 10 lbs. per ft. super., which is the nett weight of roof covering, the deflec-

tion would only be about $\frac{1}{2}$ in., and in either case cambering the joist would remove the deflection. If it were desired to find the load that this joist would carry with the ordinary limit of deflection, the procedure would be as follows:—

$$\frac{\text{span in feet}}{\text{depth in feet}} \times 0.287 = \frac{37}{1} \times 0.287 = 10.62$$

proper factor of safety to allow for the given ratio of span to depth. Allowing 30 tons per square inch ultimate strength of mild steel, then $\frac{30}{10.62} = 2.8$ tons per sq. in. safe load. The modulus of section for the

$$\text{above joist} = 36.82 : \text{bending moment} = \frac{wl}{8}$$

$$= \frac{w \times 37 \times 12}{8} = \frac{111}{2} = 55.5 w. \text{ Then } 55.5 w$$

$$= 36.82 \times 2.8. \therefore w = \frac{36.82 \times 2.8}{55.5} = 1.85$$

tons safe distributed load, which works out at about 10 lbs. per ft. super. for roof. With 28 lbs. per ft. super. the cross joists will deflect $\frac{1}{2}$ in. in the centre, but with 10 lbs. per sq. ft. the deflection would only be about $\frac{1}{2}$ in.

HENRY ADAMS.

Quantity Surveyors' Examinations.

SOHAM writes: "Please give a list of text-books required for the quantity surveyors' examinations. I already have 'Specifications' by Bartholomew, 'Quantity Surveying' by Leaning, 'Fixtures' by Sidney Wright, 'Measuring and Valuing' by Dobson & Tarn, 'Practical Surveying' by Usill, and Inne's 'Law of Easements.'"

The syllabus of the Quantity Surveyors' Association states: "The examiners do not recommend any particular text-books, as it is desired to make the examinations rather a test of the candidate's practical knowledge of the subjects generally than to find his acquaintance with any particular book or books." Besides the books named in your enquiry, you should study "Specification" (2s. 6d. nett), Macey's "Conditions of Contract" (15s. nett), Rea's "How to Estimate" (7s. 6d. nett), Stratton's "Public Health Acts" (7s. 6d.), Laxton's "Price-Book" (4s. 6d.), Shearman & Evans's "Guide to the Practice of the London Chamber of Arbitration" (2s. 6d.), Macer's "Dilapidations" (5s. nett), and Jensen's "House Drainage and Sanitary Fittings" (5s. nett).

HENRY ADAMS.

[The above books can be obtained from our offices post free at the prices named.]

Heraldic Designs on Oak Panels.

SOUTH WOODFORD.—ANTIQUE writes: "I have to prepare some detail drawings for painting heraldic designs on oak panels. Can you give me a drawing or sketch of the 'Catherine wheel' as emblazoned on shields, or refer me to a work which publishes a drawing of such an ornament? Also, is the spear notch in a shield at top or bottom?"

A drawing of St. Catherine's wheel appeared in THE BUILDERS' JOURNAL for March 7th, 1900—in the last of a series of five articles on heraldry, the other four appearing in the issues for January 10th, January 24th, February 7th and February 21st, 1900. Designs, however, differ considerably. You can see examples in Edmondson's "Heraldry," and better ones in Willement's "Regal Heraldry." It is practically a wheel, with curved knives at the ends of the spokes outside the felloe. The notch, or lance rest, in a shield is not obligatory, and, indeed, not usual, except as regards the bearings of a military man. The notch should be at the top. Although occasionally seen towards the bottom, this is unusual and merely due to the freakish idea of the artist. You can, of course, vary the shape of the shield in harmony with the rest of the decorative details. G. C. R.

A Wrong Tracing.

MISTAKEN writes: "I traced the wrong question whilst sitting for my 'advanced' certificate in building construction in May last. I made certain of all my other questions being correct. Would my mistake mean a 'fail' for me?"

As the tracing at the May examination in building construction and drawing was compulsory, a candidate tracing the wrong example would of necessity fail, but it is too much to assume that the other questions were all correctly answered.

HENRY ADAMS.

Books for Assistant Surveyors' Examination.

TEDDINGTON.—E. J. K. writes: "Please give titles and prices of books on the following subjects for assistant surveyors' examination, Board of Works:—(1) Sanitary engineer, (2) principles and practice of valuations and easements. Books concise in treatment and reasonable in price preferred. Also what was the date of the last examination and of the previous one?"

(1) The best book upon sanitary engineering is Moore's "Sanitary Engineering," published by B. T. Batsford, 94, High Holborn, price 32s. nett. There is no other work covering the whole subject, and a number of books dealing with various branches of the subject will cost more. (2) "Valuations and Compensations," by Banister Fletcher, published by B. T. Batsford, price 6s. 6d., will serve your purpose on the subject of the principles and practice of valuation and easements. A very excellent, though more costly, book is "Hints to Young Valuers," by A. R. Cragg and I. R. Marchant, published by The Land Agents' Record, Ltd., 149, Strand, price 25s. H. Y. M.

Porous Brickwork.

Referring to the enquiry under this head on p. 12 of our issue for last week, Messrs. Robert W. Blackwell & Co., Ltd., of 59, City Road, E.C., write: "We are at present supplying our 'Giant waterproof sheeting' for the damp-proofing of walls. For this purpose the material will be found invaluable and far superior to any other waterproof sheeting made. It is manufactured from a first-class Manila stock, impregnated and coated on each side with an absolutely water- and acid-proof compound. The thickness we recommend is the 1 or 2 ply. The material is applied to the wall by sticking with an adhesive solution which we supply, and we contend that if this paper is properly stuck to the wall there cannot be any question as to damp penetrating. Ordinary wallpaper can be pasted on the material, and will give every satisfaction."

Lead Hot-water Pipes.

KIRKINTILLOCH.—X. writes: "A lead hot-water pipe giving a supply to a scullery sink was embedded in a concrete floor and after being in use for a year showed signs of leaking. On being taken up the pipe was found to be cut across at various parts. Would this be caused by expansion and contraction of the lead? There is no flow and return, but simply a branch pipe lead to the sink."

The cutting of the pipe is no doubt caused by the movement of the heated and cooled pipe against some sharp edge, as of a piece of broken brick or stone. Making that portion of the concrete of smooth pebbles will prevent the damage, I think; but laying the lead pipe inside an iron one will be safe in any case. Expansion when heated from freezing-point to boiling point of water:—

$$\text{Lead } \frac{1}{80} \text{ in. Iron } \frac{1}{160} \text{ in.}$$

Expansion in each 100 measures of length, when heated as above:—

Lead nearly $\frac{3}{8}$	-	-	-	-	of one measure.
Iron $\frac{1}{4}$	-	-	-	-	" "
Stock brick $\frac{1}{2}$	-	-	-	-	" "
Various micaceous sandstones, from $\frac{1}{8}$ to $\frac{1}{16}$	-	-	-	-	" "
Granite nearly $\frac{1}{80}$	-	-	-	-	" "
York paving nearly $\frac{1}{4}$	-	-	-	-	" "

These figures take no notice of time, and the expansion of concrete depends much on the stuff it is made of. Heat conducting power of materials:—

Copper	- 892	Marble	- 24
Wrought-iron	- 374	Porcelain	- 12
Lead	- 180	Terra cotta	- 11

These figures do take notice of time, and though the total expansion of concrete may be the same as that of lead, yet if the concrete expansion be that of porcelain, the concrete takes a quarter of an hour to transfer as much heat as the lead can transfer in one minute, and the swift movement of the lead does the damage.

O. WHEELER.

Solutions for Oak Work.

WIGAN.—E. P. writes: "Is there any method of treating English oak so as to prevent rain penetrating into the timber (thus helping to prevent excessive splitting and warping when, afterwards, the sun dries the timber), but not to prevent it 'ageing,' i.e., turning grey in the course of a few years?"

It might possibly be done by dipping the timber in melted bees or paraffin wax, the former for preference. But perhaps some of our readers can offer suggestions.

Mortar for Brickwork.

VAUX writes: (1) "Selenitic lime has been used in the mortar for brickwork in a building now nearing completion. The mortar is mixed in the proportions of 2 parts sand to 1 of blue-lias lime. During the recent wet weather the mortar has swelled to such an extent that in several places the brickwork has buckled and shows cracks. The maker of the lime has seen the work and says the mortar is too strong, and should have been mixed 4 or 5 to 1 in lieu of 2 to 1. I shall be glad to have your opinion as to the cause of swelling. Should not the mortar be better mixed 2 to 1, and not 4 or 5 to 1? Where can the lime be tested? (2) Please also give me the rule for ascertaining the scantling of floor joists to first floors of dwelling-houses."

(1) Selenitic cement was invented by General Scott. His method was to add plaster-of-Paris (sulphate of lime) to a good hydraulic lime; but lime may be selenitized by adding any sulphate or sulphuric acid even. The action of the sulphate is to arrest the slaking action, cause the cement to set more quickly and enable it to be used with a much larger proportion of sand than ordinary lime. The proportion of sulphate added varies from 4 to 7 per cent., the usual proportion being 5 per cent. Selenitic cement should be used in accordance with the instructions issued by the makers. If other proportions are used the results are often unsatisfactory. The proportions recommended are 1 of cement to 5 or 6 of sand, and an excess of cement does not add to the strength, but is detrimental. The lime would be best tested by a qualified analytical chemist, such as Mr. Bertram Blount, 76-78, York Street, Westminster. (2) The scantling of floors is often specified by the by-laws on the basis of the Model By-laws of the Local Government Board. These are, however, far too excessive, and the size should be calculated by the formula for the safe load $\frac{wl^2}{16} = bd^2$, assuming a reasonable load per square foot on the floor. A useful series of tables and criticism of the existing by-laws is contained in "Roofs and Floors of New Buildings," by Ernest H. Essex, published by the St. Brides' Press, Ltd., 24, Bride Lane, E.C., price 2s. 6d.

Books on Ornament and Decoration.

A. B. writes: "Please inform me as to a course of study in (1) ornament and decoration of buildings; (2) designing lead lights, tiles, textiles, papers, &c. I have Meyer's handbook, but wish to know of works not

too expensive that give a clear explanation of the principle to be followed in each case; also is there a work on Byzantine Ornament?"

See list of books on Art, Decoration and Design in our "Book List No. 2."

Ordnance Survey Maps.

ASHBY-DE-LA-ZOUCH—DELA writes: "(1) Are the areas as given on the Ordnance survey maps calculated from stool to stool of hedge, including any ditch or ditches that may be in the field; or is the usual 4ft. allowed for ditches deducted from the field in which it actually is, and its contents added to the field in which the hedge stands? (2) Please name one or two gentlemen who coach for the R.I.B.A. examinations."

(1) The areas given on Ordnance survey maps are calculated from centre to centre of the hedges or other boundaries, and if a property is bounded by both hedge and ditch, the centre of the hedge is taken as the boundary line, and the area of the ditch is added to the area of the field in which it occurs. It should be noted that these areas do not necessarily give the legal extent of any particular property, as all boundaries such as hedges, fences, &c., are shown where they actually occur, while the legal boundaries may be 3ft. or 4ft. on either side of the hedge or fence, according to the custom prevailing in any particular county. Moreover, a landowner may form a hedge and ditch as wide as he likes, with the ditch on whichever side of the hedge he may choose to place it, provided he does not encroach upon his neighbour's legal boundary. When fields are divided by means of hedges and ditches, and no definite legal boundary has been legally fixed, it is an almost universal rule that the edge of the ditch remote from the hedge marks the division of the adjoining properties. (2) The names of gentlemen who "coach" for the R.I.B.A. examinations, will be found under the head of "Educational" in our advertisement columns.

H. Y. M.

Stability of Tall Chimney.

BECKENHAM.—F. J. B. writes: "I should be obliged if Professor Adams could help me with the following question in Mitchell's 'Brickwork,' as having been set at a War Office Examination:—

'A square chimney, 100 ft. high, 6 ft. wide at the base, and 4 ft. wide at the top, has to withstand a wind-pressure of 56 lbs. per sq. ft. What must be the average thickness of the brickwork, assuming the chimney to be simply resting upon and not attached to its base? Assume weight of bricks to be 120 lbs. per cub. ft.'

I have tried to work it by the ordinary wind-resistance against walls formulæ, but cannot get the work thick enough. Is a chimney ever built 100 ft. high and only 6 ft. square at base?"

The London County Council rules for tall chimneys stipulate that the width of a shaft at the base, if square on plan, must be at least one-tenth the total height, and if circular on plan at least one-twelfth. A shaft must have a batter of $2\frac{1}{2}$ ins. in every 10 ft. of height = 1 in 48. The brickwork must be at least $8\frac{1}{2}$ ins. thick at the top of the shaft and for 20 ft. below, and must be increased $4\frac{1}{2}$ ins. in thickness for every 20 ft. in additional height, measured downwards. No portion of the enclosures of a shaft is permitted to be constructed of firebrick, and any firebrick lining to be used must be in addition to the thickness of, and independent of, the brickwork. No cornice or other projection is allowed to project more than the thickness of the brickwork at the top of the shaft. These are sound rules and may be applied to all cases. In the case submitted, the area exposed to wind-pressure will be $\frac{4+6}{2} \times 100 = 500$ sq. ft., and the pressure being 56 lbs. per sq. ft., the total pressure will

be $500 \times 56 = 28,000$ lbs. This may be assumed to act at the centre of gravity of the face, giving a leverage of $\frac{1}{2}h\left(\frac{b+2t}{t+b}\right)$

$$= \frac{1}{2} \times 100 \left(\frac{6+2 \times 4}{4+6} \right) = 46\frac{2}{3} \text{ lbs. The active}$$

moment will then be $28,000 \times 46\frac{2}{3} = 1,306,666\frac{2}{3}$ lbs.-ft. The resisting-moment must equal this, and will be made up of the weight of the brickwork multiplied by the distance from the centre of base to the centre of resistance. Let B and b be the inner and outer width at base, then the limiting distance of centre of pressure from centre of base for zero pressure on windward side, i.e., no tension on inner edge, will be $\frac{B^2 + b^2}{6B^2}$, but

the thickness not being known b cannot be found directly. Rankine says, in his "Applied Mechanics," that $\frac{1}{3}B$ is a sufficiently accurate estimate of the required distance for practical purposes when applied to square factory chimneys, but it is probable that in the present case, owing to the smallness of the base, the value would be nearer $\frac{1}{3}B$, which is the limit for a solid square. Taking it as $\frac{1}{3}B$

$= \frac{1}{3} \times 6 = 2$ ft., we shall have $\frac{1,306,666\frac{2}{3}}{2} = 653,333\frac{1}{3}$ lbs., as the required weight of brickwork. At 120 lbs. per cub. ft., this will require $\frac{653,333\frac{1}{3}}{120} = 5,444\frac{1}{4}$ cub. ft. The

chimney being 100 ft. high, 4 ft. diameter at top and 6 ft. diameter at bottom, the contents if solid would only be $\frac{1}{3}h(A + a + \sqrt{A \times a})$

$$= \frac{1}{3} \times 100(36 + 16 + \sqrt{36 \times 16}) = \frac{100}{3}$$

$$(52 + \sqrt{576}) = \frac{100}{3}(52 + 24) = \frac{100 \times 76}{3} =$$

$2,533\frac{1}{3}$ cub. ft., or less than half the required weight, but the chimney shaft is already assumed to be filled up solid, so that the question is absurd.

HENRY ADAMS.

Carrying up Chimneys.

TALL-BOY writes: "Is it compulsory to carry up low chimneys of adjoining owners when building a new house next to same?"

It is impossible to decide this question on general lines, as so much depends on the particular circumstances of each case—the degree of damage (if any) done, and the age of the first chimney. Speaking broadly, one is answerable for any action which injuriously affects one's neighbour, and if a reasonable demand be made I do not advise resistance.

F. S. I.

The United Service Club in Pall Mall, built in the 'twenties from designs by Nash, has been entirely re-decorated and restrained: a large addition made to the smoking-room on the ground floor; lavatories, dressing-rooms and bath-rooms provided in the basement; an electric passenger lift installed by the Otis Elevator Co.; new heating system and additions to the cooking apparatus; additional staircases; and alterations and improvements to the kitchens, larders and offices generally. The architects for the work were Messrs. Isaacs & Florence, of Gray's Inn—who designed the Carlton Hotel. The drainage system has been carried out under the supervision of Messrs Shone & Ault, being the first installation of this system executed in London since it was applied to the Houses of Parliament. Messrs. Aldin Brothers & Davies, of South Kensington (whose contract amounted to nearly £15,000), were the general contractors for the alterations and additions to the Club, which have been carried out by them under the personal supervision of their manager, Mr. Leslie Shingleton, assisted by Mr. Robinson as their general foreman.

REGISTRATION.

The Provincial View, by a Provincial Architect.

A GREAT deal has been said about the advisability of making the status of architects equal in the eye of the public to that of lawyers and medical men; and much has also been said against the proposal.

The law of this country will not allow a man, unless registered, to practice the art of drawing out a fellow-creature's teeth, but it places no restriction on anyone wishing to practice as an architect—Tom, Dick or Harry—in most unfair competition with qualified men.

The London practitioner hardly appreciates the state of things in the provinces. It is there where the evil is most felt. In the Metropolis the public is better aware how to distinguish between the genuine and the bogus architect; and such men as flourish in the country by imposture would soon be exposed in town.

When it is remembered that the great bulk of practitioners are provincial men, there should be no hesitation on the part of architects to join together unanimously in making architecture a closed profession.

But many London architects who have achieved fame and fortune cannot see with any focus except that sighted on the conditions of thirty years ago, and, as a consequence, they say that what served them should serve younger men in their struggles in the profession. It is easy, however, for a man who is famous and has a prosperous banking account to pooh-pooh the idea of registration—or indeed any other reform which may interfere with his peaceful existence. Do such men as these dream of what is going on in the provinces every day? Every member of either the Institute or the Society of Architects practising in provincial towns knows only too well that, instead of being protected against impostors by such membership, his hands are tied behind his back by regulations, whilst his dishonest opponent is free to use any tactics he chooses for securing business which should rightfully go to the qualified man.

The provincial public is guided solely by appearances, and the loud-talking, loudly-dressed, vulgar and pushful trickster is as successful as the celebrated Mr. Striver in Dickens's "Tale of Two Cities," whilst the man who has spent years in making himself competent is elbowed aside.

The Only Way Out of Chaos.

Now what is required, and what is the only way out of the present chaos, is to adopt registration on lines drafted by the Institute with the assistance of the other professional bodies. So let us get such a Bill passed as quickly as possible, backed up by the whole profession; and when this has been done, let the Institute take the equivalent position of the Incorporated Law Society, and let every registered practitioner—and such only—be entitled to call himself an architect; but if he be already a member of the Institute, let that fact be known by the usual letters after his name, and let the other professional bodies become incorporated with the Institute.

With regard to the Bill going through the Houses of Parliament, there would be no difficulty if the profession acted unitedly. It is only because such a spirit has not hitherto manifested itself that the Act for the registration of architects is not now on the Statute book.

Members of Parliament are all in favour of the public being protected, and of architects being protected as well. North-country members say: "We would support such a Bill if the profession as a whole wished it." It is only the fear of falling between two stools which makes members somewhat chary of taking up the matter strongly.

Typical Floor Plan.

MCKINLEY APARTMENT HOUSE, ST. LOUIS, MO. W. ALBERT SWASEY, ARCHITECT.

Letters have been written and replies have been received, and the sum and substance of the replies is as stated above.

A future generation will indeed look back upon us as half-hearted representatives of the profession of architecture unless those who have spent the best part of their lives in educating themselves as architects make a firm stand and insist upon State recognition.

If the days of such of the auctioneers, joiners, builders, house-agents, &c., who

practice as architects are to be numbered, let a commencement be made at once. It is folly to say that the public can discriminate between merit and fraud in the architectural profession. It cannot, and does not. Whilst all men calling themselves architects are architects in the eye of the public, the only question in the minds of the people requiring plans is "Who will prepare them most cheaply?" And that is a state of thing which ought not to continue. X. Y. Z.

Notes and News.

Architect's Suicide.—Mr. A. R. Thorn, aged 34, an architect of Elm-park Gardens, S.W., committed suicide last week by cutting his throat with a razor on Putney Heath.

The Victoria Memorial at Agra, recently unveiled by the Prince of Wales, consists of a bronze standing statue, 13ft. high, placed on a marble pedestal 14ft. high, the sides of which are flanked by allegorical figures of Truth and Justice. Mr. Thomas Brock, R.A., was the sculptor for the work.

The International Society of Sculptors, Painters and Gravers.—The first section of the International Exhibition, consisting of sculpture and oil paintings only, was opened on Monday at the New Gallery. Water-colour pastels, engravings and black and white will be shown in February and March.

The New York Building Trade has come practically to a standstill by reason of a strike of the structural ironworkers. The strike threatens to become international, taking out men all over the United States and Canada. The men demand five dollars (£1 os. 10d.) a day. They are now receiving 4 dollars 50 cents (18s. 9d.).

"Architects and the General Election."—Referring to the leader on this subject in our issue for last week, a correspondent gives us the name of another architect entered in the lists—Mr. William Hunt, of Norfolk Street, Strand, who is contesting South Islington as a tariff reformer. Mr. Hunt is ex-mayor of Wandsworth, a J.P., and a member of the London County Council. We are also informed that Mr. Philip E. Pilditch, architect to Drury Lane Theatre, is putting up for St. Ives; also that Mr. Sears, L.C.C., is contesting the Cheltenham division. From a table in the "Daily Express" it appears that there are altogether 9 architects, 19 engineers and 9 estate agents putting up for Parliament, as against 181 barristers and solicitors, 154 naval and military representatives, 82 journalists and authors, and 59 artisans.

Messrs. Dargue, Griffiths & Co., Ltd., of Liverpool and London, send us one of their neat little pocket diaries for 1906. In it are included some illustrations of the King's Sanatorium, Camberwell Infirmary, and the large hospital at Seacroft, Leeds, where the firm have carried out extensive heating and hot-water supply contracts on their "Economic" steam system. Instead of the usual system of conveying live steam to calorifiers placed under every building, or the practice of placing a furnace in each, this system consists in placing only a few calorifiers under the immediate eye of the engineer. These are heated by exhaust steam from engines, &c., and from them water is pumped all over the institution for heating and domestic hot-water supplies.—An accident policy is included in the diary.

"Vibrationitis" is a discovery of the "Daily Mail." To a representative of that newspaper last week Dr. Winter Blyth, medical officer of health for St. Marylebone, said that in consequence of the excessive vibration caused by heavy motor traffic and underground railways there had been numerous instances of new stoneware drains in St. Marylebone becoming defective, and he had been compelled to recommend iron in place of earthenware pipes. Mr. Spurrell, surveyor and engineer to the Holborn Borough Council, said that while the drainage in the borough had been affected but slightly, the subsidence of buildings, owing to the various tunnels, causing the water to be drained away from beneath them, was the most serious trouble to be contemplated.

Mr. Henry Ough, A.M.I.C.E., architect and surveyor, of 64, Basinghall Street, E.C., having retired from business, has transferred his practice to Mr. John Moir Kennard, A.R.I.B.A., of 13, Railway Approach, London Bridge, S.E.

San Francisco's Æsthetic Charter—as a plan for the future development of the city which has been drawn up by Messrs. D. H. Burnham & Co., well-known architects of Chicago, is called—suggests improvements that it is thought will cost £10,000,000, and take some fifty years to execute. It will seem to some that this was rather overshooting the mark, and that there would have been a gain in presenting a scheme more financially reasonable and immediately practicable. However, San Francisco is strong, confident, ambitious, and contains many men of wealth; and it may be supposed that Mr. Burnham knew the conditions and aspirations best. The chamber of the Board of Supervisors was thronged with interesting spectators when the plan was presented, and the record is that only one voice was raised in protest. Its owner was promptly removed from the room by the sergeant-at-arms. Mr. Burnham gives great credit to his chief of staff, Edward H. Bennett, who had charge of most of the actual designing.

R.I.B.A.

A BUSINESS meeting of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W.

Site for New Premises.

After the minutes had been read, the chairman moved: "That the Council be instructed to enter into negotiations concerning a site for new Institute premises, and to report to a general meeting."

Notable New Fellows.

The following elections took place:—

Fellows.

Reginald Blomfield.
Gerald C. Horsley.
Prof. W. R. Lethaby.
E. L. Lutyens.
Mervyn Macartney.
Walter Cave.
E. J. May.
Ernest Newton.
Halsey Ricardo.
E. S. Prior.
H. Thackeray Turner.
E. P. Warren.
H. Chatfield Clarke.
Ambrose M. Poynter.
R. Burns Dick (Newcastle-on-Tyne).
W. Hawke (Cape Town).
B. S. Jacobs (Hull).
W. C. Marshall.
J. H. Morgan.
Segar Owen (Warrington).
C. J. Tait.
R. J. Thomson (Wimbledon).
T. H. Thorpe (Derby).
W. Turnbull (Wellington, N.Z.).
L. A. Westwick (Mansfield).
F. A. Whitwell.
W. H. Woodroffe.

Associates.

J. A. Lucas (Exeter).
W. D. Quirke.

Hon. Corresponding Member.

Martin Nyrop (Copenhagen).

[Of London where not otherwise stated.]

President's At Home.

Mr. Belcher will be again "At Home" in the rooms of the Institute on Monday next, from 8.30 to 11 p.m. A small exhibition of working drawings is being arranged for the occasion.

THE FORTHCOMING ARCHITECTURAL CONGRESS.

FULL particulars have now been issued of the Seventh International Congress of Architects which is to be held in London from July 16th to 21st next. The programme of subjects to be dealt with is the same as that given on p. 287 of our issue for November 15th, except that a tenth subject has now been added, namely, "The Organization of Public International Architectural Competitions."

The council of the Institute have made a grant of £500 to the Congress Fund, but in an undertaking of this nature the expenses are exceedingly heavy, and it is to the subscriptions of members of the Congress that the executive committee have to look for the means of defraying them.

Members' Subscriptions.

As in the preceding Congresses, there will be two classes of members—donors, who subscribe £4 and upwards to the funds of the Congress, and subscribing members, who pay a minimum subscription of £1. There will also be a class of lady members, intended to include ladies who accompany members of the Congress: the subscription will be 10s., and lady members visiting London will be constituted hon. members of the Lyceum club (for ladies).

The Privileges of Members

will be as follows:—A card of identity, a Congress badge, all literature issued in connection with the Congress, the final *Compte Rendu* of the Congress, an invitation to the inaugural meeting, an invitation to the reception by the Lord Mayor of London, an invitation to the garden party given by the Institute, invitations to such other fêtes as may be given by bodies or persons outside the committee of the Congress. Members will also be privileged to attend the meetings of the Congress and the visits, entertainments and the farewell banquet on payment (as is usual) of such charges as may be necessary.

In addition to the Lord Mayor's conversation at the Mansion House on Tuesday, July 17th, and the garden party to be given by the Institute, visits will be arranged to the Universities of Oxford and Cambridge, Greenwich Hospital, Hampton Court, Hatfield (the residence of the Marquis of Salisbury) and the monuments, historic houses, new buildings, workyards, schools of architecture, &c., of London. The usual farewell banquet will take place on Saturday, July 21st.

An Exhibition

in connection with the Congress, organized by the executive committee, will also be held, the chief features of which will be:—(1) A chronological exhibition of English architecture from the Norman Conquest (1066) to the death of Sir Charles Barry (1860); (2) oil paintings and water-colour drawings of English architecture; (3) English furniture and silver work.

The British railway companies will issue return tickets to London, available from July 11th to the 25th inclusive, at the rate of a single fare and a quarter, to members of the Congress.

The executive committee will be glad to receive papers for presentation to the Congress. Papers may be written in English, French, Italian or German. Each paper must be accompanied by an abstract of not more than 1,000 words. Paper and abstracts must reach the executive committee before April 30th next.

All communications should be addressed, and all cheques and postal orders made payable, to "The Secretary, Seventh International Congress of Architects, 9, Conduit Street, London, W."

THE LIVERPOOL TIMBER TRADE.

(By our Own Correspondent.)

THE closing month of 1905 brought a considerable amount of business for timber merchants and brokers at Liverpool. Allowing for the interruption caused by Christmas, the timber trade of December may be spoken of as good. Holders of builders' wood have been favoured by the long run of mild weather. Contractors in the Liverpool district who have had work in hand have made good use of the last few weeks, and a large quantity of roofing joists and flooring timber has been worked up.

Soft Woods.

Light arrivals of Quebec pine-deals and a very fair consumption have left the stock of this timber smaller than at the beginning of 1905, and values very firm. Quebec spruce-deals came to hand more freely than last year; and though the demand for these was moderately good, the year closed with a larger stock than twelve months ago.

New Brunswick and Nova Scotian spruce and pine-deals arrived in slightly less quantities than a year ago. The demand for these woods has been fairly active and sustained, so that the stocks in hand are lighter. Values have improved, and timber of the kind is in a strong position.

Whitewood planks and boards from the United States also came to hand in smaller quantities, but notwithstanding the consumption, large stocks of whitewood boards and planks are now held.

Norway flooring boards were received in moderate quantities, but have not had an active sale. Stocks are slightly in excess of those of a year ago. Baltic red-deals and boards, though not arriving in large quantities, came to hand more freely and left stocks materially larger than at the beginning of last year.

Pitch-pine has reached Liverpool in comparatively small quantities of late, and stocks of hewn, sawn and planks show a considerable shortage compared with twelve months ago. Prices have further advanced, and, as the consumption is maintained, all kinds of useful wood are strongly held.

Hardwoods.

The December sales of mahogany were well attended and the competition generally was brisk. The best average was made by seventy-three logs of Labou wood, which sold at prices ranging from 2½d. to 3s. 6d.; the average being 5½d.

American walnut in logs is held in good supply. Active business has been done in logs, planks and boards, and full prices have been obtained.

Oak from western ports has come to hand in moderate quantities, and stocks are much lighter than at the commencement of last year. Prices are fair to moderate, according to the class of wood.

Teak has been received in larger quantities, but sales are small and prices show little change.

The Timber Trade and the Dock Board.

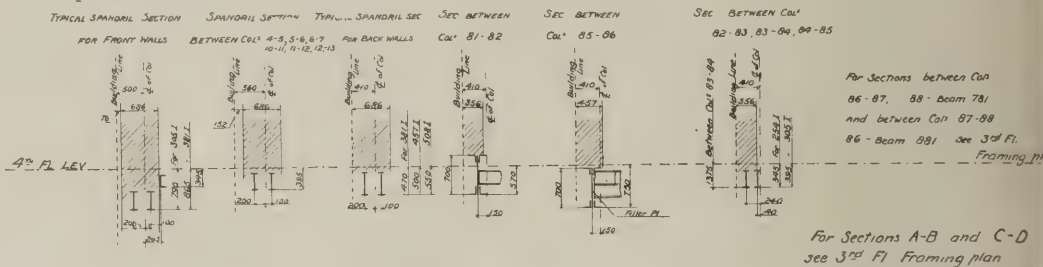

The attempt of the Liverpool timber trade to obtain representation as a trade on the Mersey Docks and Harbour Board, at the recent election of members of the Board, was not successful. Five of the retiring members of the Board, and a candidate nominated in place of a member who retired and did not seek re-election, were returned; two candidates who had been nominated to

represent trading interests which have lately been without direct representation on the Board failing to obtain seats. One of these, Mr. Holford Harrison, was nominated as a representative of the timber trade. Mr. Harrison fought a good fight, 790 votes being given for him, as compared with 1,036 for the returned member, who polled the smallest number of votes; and 1,280 for the member who polled the greatest number.

That 790 votes were given for Mr. Harrison was proof of the existence of a strong feeling among the electors favourable to granting the claim of the trade to representation on the Dock Board. Mr. Harrison's candidature will have been of service, as it has caused the position of the trade in respect of accommodation, the value of the trade to the port, and the relationship between the

trade and the Dock Board to be freely discussed in Liverpool.

Though Mr. Harrison was not elected a member of the Board, it must not be assumed that many of the electors who voted for other candidates did not approve of the claims of the timber trade. The truth is that unless some strong cause be shown why an old member of the Dock Board should not be re-elected, a newly-nominated candidate will have little chance of being elected—unless, as in the case of one candidate at the recent election, a new candidate be nominated by an interest which has had representation—to take the place of a retiring candidate. As the timber trade has not had a representative on the Board of late, the majority of the electors voted for the representatives of the old interests.

RITZ HOTEL, PICCADILLY, LONDON

THE RITZ HOTEL.

ON this page we give the steelwork framing plan for the fourth floor of the Ritz Hotel, now being completed in Piccadilly, London.

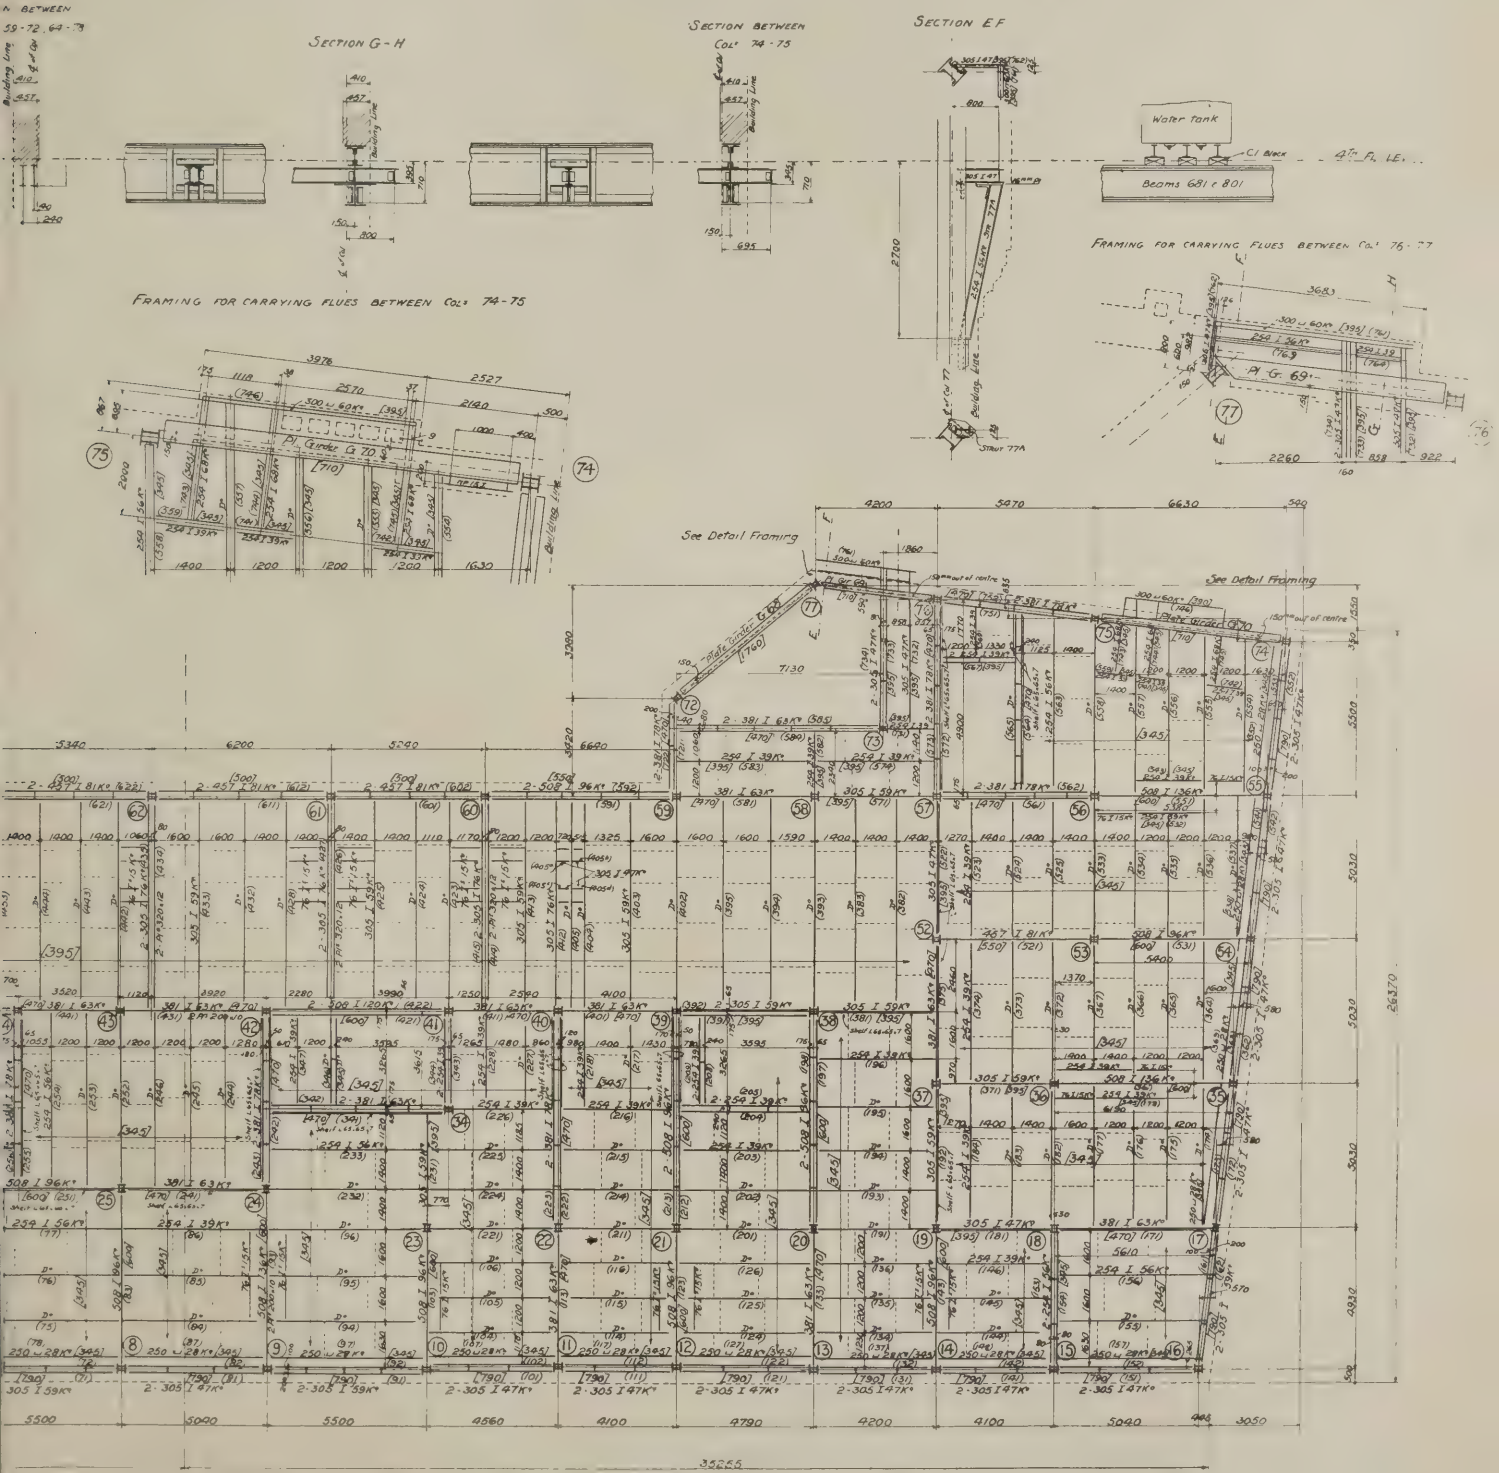

The general principles and indications on the drawing have been explained in connection with other framing plans of the hotel published in our pages (see our issue for March 22nd, 1905). The chief feature of this plan is the construction between columns 77 and 74 for carrying the chimney stack. This stack is carried from the fourth-floor level on cantilever roin. by 6in. I-beams. The system adopted is indicated on section G—H. A hole is cut in the web of the plate-girder G 70 and the beams are extended through and form the canti-

lever. The web of girder G 70 is strengthened by means of web reinforcing plates and angles. Opposite column 77 no cantilever could be used, as it would interfere with the staircase. An inclined strut of roin. by 6in. I-beams is used for supporting the beams for the stack. Sections through the set-back wall next to Arlington Street were shown on the third-floor framing plan in our issue for September 13th, 1905. In the first panel from the open court will be noticed three beams placed close together and marked 455, 456, 457, &c. They are connected by four diaphragms marked 456 a, b, c, d. These diaphragms are so made of plates and I-beams that a load placed on the centre-beam will be uniformly distributed on the three beams. These beams carry chimneys. No deep beams could be used by reason of

their showing in the ground-floor hall. In the upper left-hand corner of the plan on this page is shown the position of the spandrel beams in the walls.

Change of Address.—Mr. William H. Thorp, F.R.I.B.A., has removed his offices from No. 61, Albion Street to Phoenix Chambers, South Parade, Leeds.

The Catholic Apostolic Church, Glasgow.—A new aisle on the north side of this church—in Catherine Street, Glasgow—has just been completed from designs by Messrs. Salmon & Son & Gillespie, of Glasgow, together with new south and west porches, baptistery and ladies' room, at a cost of about £3,500. The original church was built from sketch designs by Pugin.

OUR PLATES.

ST. ALBAN'S CHURCH, Southend, has been recently completed by Messrs. Leaney & Co., builders, of Southend. The design is of the simplest character, working out at about £7 per sitting. The interior is finished in plaster without stone dressings, but some of the furniture is of more elaborate character. The rood screen shown in the illustration was carried out in oak by Mr. H. K. Kuchemann, of Pitsea, Essex. The church has no east window, it being hoped eventually to fresco the whole of the east wall. The rood screen, pulpit and altar were designed by the architects, Messrs. Nicholson & Corlette, of London.

St. Matthew's Church, Cockington, Devon, was begun about ten years ago, when the nave and aisles were built. It has been completed lately by the addition of the chancel, tower and side chapel. The tower is placed over the last-named, and, owing to the fall of the ground, the vestries are placed in a large vaulted crypt underneath the chancel. The church is built of a hard red stone quarried in the parish, and is lined with ashlar of Paignton conglomerate. The external dressings are of Doulting stone. The church has cost about £7,500, including fittings, and it holds 500 worshippers. The western portion was built by Mr. R. F. Yeo and the eastern by Messrs. E. P. Bovey & Son, both builders of Torquay. The font shown in the illustration is of polyphant stone. The two statues were carved by Mr. E. Lynn Jenkins, sculptor, of London. The oak canopy was the work of the late Mr. Herbert Read, of Exeter, whose son made the oak pulpit. The font, pulpit, &c., were designed by the architects, Messrs. Nicholson & Corlette.

We would mention that our photographs are not without deficiencies, more especially in regard to the tracery in the window behind the font at Cockington. They serve, however, to represent this excellent modern church work by two notable architects.

THE BUILDING TRADE IN 1905.

The following further reports on the state of the building trades in various centres during the past year have come to hand:—

England.

Coventry.—There was a further decrease in the number of plans approved and number of buildings completed over former years. The former amounted last year to 685 and the latter to 426, as against 716 and 746 respectively for the former year.

Gainsborough.—Trade has been fairly prosperous here.

Long Eaton.—Building has been fairly brisk in 1905.

Nottingham.—The building trade has been fairly active, and the figures would undoubtedly have shown an increase on those of 1904 had it not been for the threatened strike during the six months from April to September. Despite this, 1,782 buildings were completed and nine new streets laid out. In 1904 the total was 1,949, a decrease on 1903, which was a record year.

Shipley.—Here again trade has been stagnant.

Sunderland.—Last year 365 plans were approved.

Worthing.—Trade has been quiet, but this year is expected to be an improvement.

Scotland.

Dundee.—Trade had been very dull during the year. In 1904 the value of buildings erected was about £167,000, but the total for 1905 will be considerably short of this. There has been no trade dispute and wages have shown no change.

Edinburgh.—Trade has generally been dull.

ST. MATTHEW'S CHURCH, COCKINGTON, NEAR TORQUAY. NICHOLSON AND CORLETTE, ARCHITECTS.

The record of work passed by the Dean of Guild Court for the year represents a value of £658,015. Embraced in this amount were 713 warrants for sixty-two tenements, fifty-one villas, 260 self-contained houses, 132 public and other buildings, and 492 alterations. For the corresponding period last year the total work represented a value of £977,883, representing 832 warrants for sixty-seven tenements, seventy-one villas, 212 self-contained houses, 123 public and other buildings and 583 alterations. In the central division of the city there has been nothing of note to chronicle save the completion of the Professional and Civil Service Store in George Street. In the west end some tenements and business premises have been erected, and at Murrayfield the same steady building of better class villas has been in progress during the year, and it is not supposed that this locality will be at a standstill until all available building ground has been taken up. In Morningside there have not been so many houses built as in former years, but they are of a very desirable class. A number of tenements have also been built in this neighbourhood, and also a branch library. In Portobello there has not been so much speculative building in this locality for a considerable time; it embraces both tenements and self-contained houses. The new Roman Catholic church is well advanced, and citywards may be noted the erection of a large new building for the manufacture of bricks. At Granton a large addition has been made to the huge premises of the Edinburgh and Leith Gas Commissioners. Beyond Craigleith Station a number of self-contained houses are being built, but in Comely Bank, where of late there has been so much work in operation, a sudden collapse has taken place. Extensions have been made to printing works in Causewayside, and also at Parkside. In the latter case the Hennebique patent system of ferro-concrete fire-proof construction is being introduced for the first time in the city.

Glasgow.—The past year has not been a

prosperous one for the trades connected with the building industry. For several months they were all affected by a large number of the operatives in two of those trades stopping work with a view to resisting a reduction of wages, and other differences arose between employers and employed in reference to working rules. There has been a considerable falling off in the number of applications to the Dean of Guild Court of Glasgow for new buildings, as well as in the value of all classes of property, in contrast with previous years; indeed, the value is the lowest since 1896. No doubt the reason for this has been that within the city the supply is sufficient for present requirements. The large amount of building of dwelling-houses which is in progress in the suburban districts of the city has also to be taken into account. These houses in most cases become occupied as soon as they are ready, showing that there is a growing disposition to migrate from the city to the suburban districts. Speculative building is for the present practically at a standstill. The total valuation of the new property which came before the Dean of Guild Court last year is £1,439,434, as against £2,118,800 for the previous year.

Leith.—The building trade in Leith has been in a very depressed condition during the year, and there are no signs of work becoming brisker for some time to come. The Dean of Guild Court granted 100 warrants for new buildings—value estimated at £92,000. In 1904 the value was £180,000 and in 1903 £269,000.

Ireland.

Belfast.—The depression which followed the "slump" in the building trade a few years ago still hangs over the trade, and during the year the hoped-for improvement has not taken place—at any rate with regard to large contracts. True, there have been some important work in progress, but most of these were a legacy from previous years, and very few new buildings of any magnitude have been initiated.

THE FONT COCKINGTON CHURCH.

ST. MATTHEW'S CHURCH, COCKINGTON, NEAR TORQUAY, LOOKING EAST. (Rood and Beam Temporary Only.)

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

This pair of villas, for Dr. Blagdon Richards, is one of ten pairs now in course of erection on the Coedsaeson Estate, Sketty, Swansea, for the Grosvenor Building Club. The materials are stock bricks faced with Portland cement, rough-cast; wood frames and sashes painted white; roofs covered with best Welsh green slates; and the chimneys faced with Lawrence & Sons' No. 6 cherry-red facing bricks. The boundary walls, steps, &c., are all of local stone. The contractors are Messrs. Pye, Parkinson & Co., Ltd., of Eversleigh Road, Sketty, Swansea, and the architect is Mr. Harold Kennard, of 13, Railway Approach, London Bridge, S.E., and 33, Castle Street, Swansea.

Correspondence.

Christ Church, Moss Side, Manchester,

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In illustrating the above in your issue for last week you referred to me as being an "F.R.I.B.A." Kindly permit me to say that this is an error, as I have not the honour of being connected with the Institute in any way. The letters referred to were added to my name without my knowledge, and immediately I saw the mistake I wrote to the secretary of the Institute pointing out this fact to him. Yours truly,

W. CECIL HARDISTY.

MANCHESTER.

[We regret the error to which Mr. Hardisty draws attention. It was purely an oversight on our part.—Ed. B.J.]

The new Cathedral at Berlin.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Accompanying the excellent little illustration of the new cathedral at Berlin in your issue for December 27th you give some particulars of the size of the building. It is stated that the cross on the central cupola reaches to a height of about 374ft.—"which is nearly 79ft. less than St. Peter's, Rome, and more than 9ft. higher than St. Paul's. The total length of the building is 374ft. and the width nearly 80ft."

I spent some time in Berlin during the past summer, and the assertion (which I am aware has been freely made) that Berlin's much over-praised Dom is really higher than St. Paul's Cathedral in London is certainly not correct; nor the statement that it is only 80ft. wide. In regard to the latter I may add that the central dome itself has an external diameter of 125ft. (internal 102ft.).

There appear to be several different semi-official renderings as to the dimensions of this building. Bradshaw's "Continental" says: "It is 350ft. long, 260ft. broad and 360ft. high"; whilst Baedeker's "Berlin" says: "Length 394ft., breadth 262ft., and to the highest point of the dome 361ft."

It might be useful if anyone can say what

is the real extreme length, width and height.
—Yours truly,
HARRY HEMS.
EXETER.

[We have no official figures about the new cathedral at Berlin. The dimensions we gave were those published at the time of the opening of the cathedral last year. St. Paul's is 363ft. to the top of the cross, so that, on Bradshaw's and Baedeker's figures given above, the two cathedrals are about equal in height. St. Peter's, Rome, is 437ft. 6ins. to the highest point. The width of the nave of St. Paul's—or rather the nave and aisles, but not including recesses—is 123ft., and the dome about 100ft. diameter at the whispering gallery level. It is difficult to get at precise figures in these matters, and we should be glad therefore to hear from anyone who can state exactly what are the dimensions of the new cathedral in Berlin. Ed. B.J.]

Mitchell Library, Glasgow.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Not the least valuable feature of your very interesting double number for December 27th is the list of competitions in 1905, which, so far as I am aware, is the only complete list published, and on that account likely to be widely used for reference. Permit me therefore to point out that the result of the Mitchell library competition is recorded in a manner that is almost certain to convey to your readers the impression that three designs selected by the assessors have been passed over and a design not selected by them accepted by the Corporation. This, however, is not the case, as the accepted design is that placed first by the assessors, the first-, second- and third-premiated designs being placed next in order of merit.—Yours truly,

W. B. WHITIE.

GLASGOW.

[It was difficult to record exactly how this competition was decided, but the above letter from Mr. Whitie, the author of the selected design, makes the matter clear. Ed. B.J.]

Competition.

1 Norwich Shire hall Extension.

The committee of the Norfolk County Council, on the advice of their assessor, Mr. A. J. Wood, of Surrey Street, W.C., recommend that the first premium of £100 in the competition for extensions to the Shirehall at Norwich be awarded to the design marked "M"; the second premium of £50 to the design marked "G"; and the third premium of £25 to the design marked "D." The names of the respective authors are not yet announced. The architect of design "M" estimates the cost at £8,850, but Mr. Wood puts the cost at £13,820; the architect of design "G" estimates the cost at £13,210, Mr. Wood's estimate being £13,640; while the architect's estimate of design "D" is £9,500 and Mr. Wood's estimate £13,400. It is probable, therefore, that the cost of the extension will not exceed £14,000. The names of the successful architects in this competition will be announced later.

THE TIMBER TRADE.

London Market in 1905.

THE year 1905 has been one of chequered fortune for the timber trade, but it may be said to have come nearer on the whole to realizing the hope of better things with which it started than seemed probable between March and October.

Messrs. Churchill & Sim observe, however, that the London trade for the year must be pronounced unsatisfactory. Importers bought too early and too freely, and thus were in stock during the early part of the year while prices were falling. This put them out of heart, so that, as a whole, they had no courage to buy again in the mid-summer period, when prices were at their lowest; and the rise having come in the late autumn, they are now lightly stocked, and cannot do much more than recoup the losses of the earlier part of the year. Then, too, the building trade in and around London was persistently bad during 1905, but there are signs at last to be drawn from the figures of the estimated consumption which point to better things this year. The shrinking process which has been coincident with the new century has been checked in 1905. The dock deliveries show a further reduction of some 16,000 standards on those for 1904, but this is nearly balanced by an improvement of some 13,000 standards in the overside deliveries; and it has to be remembered, in thinking of the life of a trade, that this shrinkage in the consuming powers of the London market has only been going on for about four years, and if this is to be the bottom of it for the time, as now seems likely, it has not reached nearly so low an ebb as, say, in the lean years before 1897. The London wood trade wants all the help it can get. The danger that it will be left out altogether is one that should be risked, and can be minimized by judicious and moderate purchases of such supplies as are certain to be required. The London market will be helped this year by the concession of increased facilities for cheaper railway transit for wood from the Surrey Commercial Docks, skilfully and patiently worked for and brought to a successful issue last month by the directors of that company, to whom the thanks of the trade are due. Other efforts in the direction of cheapening the Port are greatly to be desired, but must be looked for more on the lines of the rearrangement and adaptation of the incidence of existing rates to the changing and varying phases of the trade than by the pleasant wholesale reductions advocated by some who forget that there are two sides to most questions.

The Board of Trade returns give the following figures:—

WOOD IMPORTED INTO THE UNITED KINGDOM IN 1905.			
Sawn and planed:—		Loads.	Value.
Russia	-	2,120,520	£4,962,192
Sweden	-	1,522,399	3,442,227
Norway	-	499,127	1,363,161
United States	-	490,632	1,695,466
Canada	-	1,160,169	3,266,591
Other Countries	-	192,938	583,543
		5,985,785	£15,253,180

The record of the past year in its general features bears a close resemblance to that of 1904. Both years have been marred by the severe depression which has prevailed since the outbreak of the Russo-Japanese war. Messrs. Foy, Morgan & Co. state that the diminution in the consumption during the past two years may be reckoned at about 10 per cent. of the average consumption of the busier period from 1898 to 1903, while the returns show a reduction of about 9 per cent. in the importation of sawn and planed wood goods during the last two years as compared with the averages of 1900-1-2 and 3. It is interesting to notice, moreover, that the average cost of the supply has also consistently fallen from £9 6s. 3d. in 1900 to £8 8s. 3d. per standard at the present time; but notwithstanding this circumstance the lowered cost has been powerless to stimulate business owing to the stagnation in the building trade.

Russian Supplies Foremost.

As regards the sources of supply, Russia easily takes the first place, having shipped to the United Kingdom a larger volume of wood goods than has hitherto been sent by any exporting country—a record which is especially significant in that it happens to coincide with such a striking reduction in the general volume of the import.

The main deficiency is found in the reduced shipments from Canada and the United States, which are wholly the result of the home consumption, due to the enormous growth of population and prosperity throughout the American Continent. This change in the character of the import calls for special attention, owing to its persistence from year to year; for whereas in 1900 and earlier the supplies from Sweden were always, and from Canada frequently, in excess of those from Russia, it would seem at the present time that we are not able to take from Canada much more than half nor from Sweden more than three-fourths of the quantity procurable from Russia.

Financial Profits.

While the resemblance between the last two years has been statistically very close, the record of 1905 from a profit-making point of view has fortunately been much more favourable to the trade than it was in 1904. Allowing for the sustained depression under which business operations have been conducted, prices have kept uniform, and a working profit, even if a small one, has been the reward of the majority. Contrasted with the previous year, when constant losses due to falling markets were the rule rather than the exception, the result of the past year's trading must on the whole be considered satisfactory so far as it goes, but it must not be overlooked that the great reduction in the import for two years in succession has been the main foundation of this successful trading. Another result of this curtailment of supplies—less desirable if the uniformity of prices is in the long run the best criterion of safe business—is seen in the abnormal reduction in the stocks left in this country, which are now probably far below the level they have reached for many years past. It

is scarcely probable that, amid the many signs of revival in general trade, the demand for wood should remain on the same restricted scale that has characterized the recent years of depression, and it scarcely needs pointing out that the effect of even a slight expansion in consumption falling upon unusually small stocks might quickly lead to an inflation of prices which, however welcome to large stockholders for the time being, would inevitably react to the disadvantage of the home markets in the coming season.

The statistics relating to London call for particular attention just now. In the first place, the dock stocks all round are the smallest carried in recent years, and in fact, to go beyond the figures actually printed, it may be added that in this respect deals constitute a record for twenty-one years, while the same may be said regarding battens, pine, spruce and floorings respectively for some ten or eleven years. On the other hand, the increase in the overside returns is very considerable, but this fact to some extent tends to qualify the immediate inference that might be drawn from the extraordinary figures of the dock stocks, because the overside returns, especially at this time of the year, should be regarded more as an addition to stock than as consumption. So, if the dock stocks are smaller, it seems to follow that the stocks held at private depôts are so much the larger.

ANNUAL IMPORT INTO LONDON, JANUARY 1ST TO DECEMBER 31ST.

American Hardwoods.

Oak.—Messrs. Foy, Morgan & Co. report that there seems to be less demand for quartered oak, and prices are lower. During the early part of the year there was a scarcity of really prime plain oak, and prices sensibly advanced. Since the summer the supply has somewhat improved, but not sufficiently to cause any appreciable reduction in values. Lower grades have been in steady demand at somewhat reduced prices. Boards have done well during the year, and prices are fully maintained.

Whitewood.—So far as can be estimated the volume of business transacted during the past year has been very much on a parity with that of 1904. It is impossible to arrive at anything like close figures, as such a large proportion of the trade is done by means of overside and "ex quay" deliveries, of which no public records are kept. Prices during the year have continued firm, and the only fluctuations have been the momentary ones which have occurred now and then when particular grades or sizes happened to be in short supply for the time being.

Maple Flooring.—A steady business continues to be done in this article, the merits of which are becoming more and more appreciated by all classes of users. Prices have slightly advanced during the year, and it is not unlikely that they will go still higher in the near future. Even a still further moderate rise in price would not make maple an expensive flooring when the lasting qualities of the wood are taken into account.

Australasian Hardwoods.

The consumption of jarrah has been below and the import above the average, and prices are consequently now rather weaker than at the commencement of 1905. Forest mahogany has not been imported, and there is only a limited outlet for it, but blackbutt has been extensively employed and is growing in favour for wagon construction, and also for paving. Moaewood has been experimented with as a substitute for teak, but has made little headway in England, in spite of the high cost of teak. The British Admiralty, after trial, decided against its use.

Teak.

In their review of the past year Messrs. Leary & Co. state that the trade in East Indian teak exceeded that of 1904, but was smaller than that of 1903 by no less than 31 per cent. as regards imports, though only 1 per cent. in consumption. Stocks are 22 per cent. less than the figures at the same date last year, themselves 27 per cent. below those of 1903, constituting a record for more than twenty years. Prices advanced rapidly and uninterruptedly throughout the year, and although present values constitute a record it is to be feared we have even now not reached high-water mark, as there is no sign of the demand diminishing. Attempts to introduce second-class timber have met with some success, and if the experiment is satisfactory to consumers regular shipments will doubtless follow.

Messrs. Denny, Mott & Dickson state that the stocks of teak in Europe at the present time are the smallest for at least fifteen years. In respect to Java, whilst it is certain that this source of supply will continue to be developed, and will increasingly find its way into consumption—however much it may be objected to for not being so light or mild as Burmah wood—it must be recognized that the want of length in this wood unfits it for much of the high-class construction in which teak is required, and this drawback chiefly arises from the conditions of growth in Java

as compared with those in Burmah and Siam, and cannot therefore be greatly modified by better supervision of the shipments.

Mahogany.

In so far that it has seen no sudden or violent fluctuations either in demand, imports or prices, the past year has been satisfactory as regards the mahogany market. The volume of business done has been considerable. Honduras and the African from Axim, &c., are the only items which show any increased supply worthy of special mention; imports of Guatemalan and Panama advanced considerably, but even so the total business done in these descriptions was insignificant; all the other producing countries were either represented by negligible supplies or have sent us distinctly less. The nett result is a considerable decrease in the total arrivals, compared with 1904, although they are well above the average for the last ten years; the consumption is, on the same average, even more satisfactory. A table showing the import of logs during the year is given below.

Views and Reviews.

English Gothic Architecture.

We have not space to adequately summarize the many conclusions which Mr. Bond has come to in this most important work on the history of Gothic architecture, and we must confine ourselves to general remarks. Previous to the appearance of this book, the subject was almost in a state of chaos, notwithstanding the great influence of the Gothic Revival. The older authors are altogether untrustworthy, their theories are far too narrow, and their endeavour to obtain a hard-and-fast classification has been a stumbling block to any intelligent advance. Mr. E. S. Prior's "Gothic Art in England" was the only modern treatment worth anything, but he left much undone. It has therefore remained for Mr. Bond to write the first thorough and reliable book on our national architecture, a subject which should be interesting to every educated man. Mr. Bond refers to the fact that nowadays the public are indifferent to architecture, and recalls the time when our aristocracy studied it with enthusiasm. We ourselves could wish the present indifference and almost total ignorance were dispelled, but there is no doubt that the advance of education has widened the sphere of interest (embracing science, for instance), and we cannot expect the same enthusiastic interest in architecture to return.

Mr. Bond has taken an evolutionary view of architecture, and shows how Gothic work developed from the constructive needs. He has succeeded in treating the subject broadly enough to counteract in great part the natural tendency of historical treatment to arbitrarily classify buildings. He shows the relation of English architecture to the architecture of France and Rome, and discusses the planning, the systems of vaulting employed, the buttresses, the drainage of roofs and protection of walls, and decorative elements such as capitals, bases, window tracery, doorways and porches, towers, spires, &c. The book is remarkably well illustrated. In fact, there are 28 whole-page collotypes, 785 reproductions in the text, in addition to 469 diagrams, such as plans, mouldings, sections, &c. One noticeable feature, too, is the inclusion of many measured drawings and the classification of mouldings, bases, &c., in a much ampler and better form than they have ever been done before. Every student should read this book, which is very cheap considering its size and the fine way in which it is produced.

"Gothic Architecture in England," by Francis Bond, price 31s. 6d. nett. London: B. T. Batsford 94, High Holborn, W.C.

STONDON MASSEY CHURCH.

Mediaeval Architecture in Essex.

Mr. Godman has published on his own account the first of a promised series of volumes on the mediæval architecture of Essex. As he himself says, this is a task that looms large, and one closes the book with a feeling that the State ought to have all such matters in hand. If there is doubt on this point it will be removed by reading the recently published work by Prof. Baldwin Brown on "The Care of Ancient Monuments," in which the shameful indifference of England to the fate of historic monuments is compared (to her disadvantage) with the zeal of some foreign States. After generalising we must particularize, proceeding to thank Mr. Godman heartily for having shown in this volume on Essex how the survey of which there is need should be started. Since the county of old consisted so largely of forest, the extensive employment of timber by the mediæval builders is not surprising, nor is the ingenuity shown by the use of it in the solution of structural problems. There being no workable stone in Essex, and the art of brick-making having been lost when the Romans left, the wooden buildings would head the list, but unhappily at the present day there is only one such left, and it seems better to speak of what the county can boast of still. As in the neighbouring counties, buildings of flint bedded in rubble, depending for their ornamentation entirely on imported workable stone, form a considerable class by themselves, but still special to Essex are her fine churches of brick with their towers and spires, which, as Mr. Godman says, are worthy of illustration, and careful and sympathetic record.

The accompanying illustrations of Stondon Massey Church and St. Mary's Church, Shenfield, are typical examples of the wooden spire so characteristic of the county of Essex.

"Mediaeval Architecture in Essex," by Ernest Godman, secretary of the Committee for the Survey of the Memorials of Greater London. Published by the author at Sunnyside, Banstead. Edition limited to 250 copies.

Obituary.

The late Mr. H. H. Armstead left estate which has been proved at £14,600.

Mr. W. H. R. Crabtree, borough surveyor of Doncaster, died recently, aged 48.

Mr. W. Smith, builder, of Newark, died recently. He erected most of the important buildings in Newark, including the hospital, the school of art, and the infirmary extension.

Mr. A. E. Johnson, F.R.I.B.A., of Melbourne, died recently. He designed many important buildings in Melbourne, including the post-office, the Bank of Victoria, the Imperial Insurance Office, Union Bank and the Athenæum.

Mr. G. Waizbom, builder and contractor, of St. Helens, died recently in his seventy-fifth year. Deceased was the oldest builder in the town, having been in business for more than thirty years: he retired four years ago. Among public works carried out by him at St. Helens are a sub-police-station, library, bowling green pavilion, shelter-houses, and the extension to the Conservative Club.

Mr. A. W. Mills, of Bowden, Cheshire, architect of the Manchester Royal Exchange and other public buildings in Manchester and elsewhere, left estate valued at £92,046. He has bequeathed £8,000 to the Manchester Society of Architects, of which at least £5,000

ST. MARY'S CHURCH, SHENFIELD.

is to be set aside to form a permanent source of income, the Royal Institute of British Architects to decide as to the investment and expenditure of this fund if the local council are unable to agree; £4,000 to Owens College, Manchester, to be invested to form a permanent endowment for the college; £3,000 to the Manchester Royal Infirmary and Dispensary; and £3,000 to the Manchester Grammar School, to found scholarships tenable for boys at either the Universities of Oxford or Cambridge who for three years previously to their matriculation at the selected university shall have been educated at the Manchester Grammar School.

Mr. William Gabby, a well-known Belfast builder, was found cut to pieces by a train at Carnalea Station, Co. Down Railway, last week. He executed many and large contracts in Belfast and vicinity, and for the past fifteen years his services as an arbitrator were often requisitioned by litigants in the building trade. Two years ago he acted as building expert for the Board of Trade.

Mr. Frederick Sang, "the father of coloured architecture in this country," died at Twyford Abbey recently, aged 94. He was born in Germany, but he settled in England and became a British subject. His chief work was the decoration of the Royal Exchange when it was opened by Queen Victoria and Prince Consort. These decorations still exist, especially in the ceilings of the Grand Ambulatory, some of them being frescoes. He also decorated the Coal Exchange and several other important buildings in the City; St. George's Hall, Liverpool; and St. Pancras Hotel and Station. In the West End he decorated all the principal clubs and the chief mansions of the nobility. In architecture he also did much work during his long career. He received the first prize in the competition for covering the quadrangle of the Royal Exchange with a glass roof, though the actual commission was executed several years later by Mr. Barry. His Westminster improvements, the scheme for the concentration of the Government offices, and the decoration for a new National Gallery in Trafalgar Square were exhibited at the Royal Academy. He also sent in designs for the Albert Memorial, the proposed Royal Mint on the Embankment, the Roman Catholic Cathedral at Westminster and Brompton Oratory. Abroad, he planned the overland route to India by way of North Africa and the Euphrates Valley; and also the docks and granaries on the Danube. In the latter scheme the present veteran Emperor of Austria, as well as the then King of Bavaria, took a great interest, granting audiences to the architect to enable him to explain his project.

A Mahometan Mosque is to be built in Paris on a site near the Invalides.

Watts's "Physical Energy": Proposed. Cast for Edinburgh.—A project has been mooted to obtain for Edinburgh a cast in bronze of the late Mr. G. F. Watts's "Physical Energy." This, it will be recalled, is a figure of a youth on horseback, and was meant to be an embodiment of the restless energy of the present day and of the wonderful control which science has secured over the forces of nature, though it may also be interpreted to symbolize the foresight and courage of an explorer who has ridden his horse to a lofty summit, from which he has discovered a new country, of which he is prepared to take possession. The Treasury of the late Government, with the consent of Mrs. Watts and the Watts trustees, authorized a cast in bronze to be made from the group to be set up in some prominent place in London as a memorial of Mr. Watts. It is estimated to cost £2,000. The effort to get a cast for Scotland owes its initiation to Mr. Pittendrigh MacGillivray, R.S.A.

THE LADY OF THE HOUSE AND THE LOCAL DECORATOR.

What the Architect has to Suffer.

IN a paper on "Interior Domestic Decoration" which he read recently before the Natal Institute of Architects Mr. Reginald G. Kirkby, A.R.I.B.A., referred to the question of clients and their tastes.

The architect, he said, was rarely allowed a free hand in the execution of his decorative schemes. His work was usually more or less of a compromise. The habits, tastes and mode of living of the client had to be carefully considered, but in the event of a client wishing to introduce colours and features which did not harmonize, difficulties were created which were not easily overcome, and often excellent schemes were wrecked by the insistence of ideas out of keeping with the general design. Such was the case when the architect had to consult the lady of the house, who had set ideas on certain lines formed by influences which were not always in the true interests of art. Thus the enthusiasm of the architect was often crushed by the compromise that had to be made in the carrying out of his designs. How often did we not find that the client who was most uninformed was the most interfering and difficult to deal with. Almost every woman when she possessed a home of her own seemed to think that she had been endowed by Nature with special gifts to decorate it, without ever having studied the underlying principles or read such works as would give her a proper idea of the subject. Many decorative schemes had been utterly spoilt at the outset by a client having recklessly purchased articles of furniture which were of themselves expensive and interesting but not at all in keeping with the general atmosphere of a home, and so making a satisfactory result impossible. Or perhaps wallpapers were purchased without any due regard to the size, shape and aspect of the room. The local decorator (spelt with capital letters) often came to the assistance of the client. He knew what was best and what would suit the room without ever having seen it or its position, and by his persuasive powers made the would-be purchaser believe that this or that paper was just the one needed, and that if the purchaser did not like it in the dining-room, then it would suit the bedroom equally well.

In this respect there was an increasing need for properly-equipped schools of art, which had a great field open to them to train the younger generation of decorators aright, so that they might intelligently advocate those goods which were of the best design and give some evidence of a serious study of modern decorative motives, instead of the listless and inanimate results it was our lot to endure. The local decorator in a large measure controlled the progress of decorative art, but unfortunately he was rarely qualified to advise his customers properly; and such schools might also do a great deal in the advancement of art amongst the gentler sex, who were so largely responsible for the good or ill effect of domestic decoration.

New Art.

Speaking of the New Art, Mr. Kirkby said its advent was like a thunderbolt dropped amongst dry bones. The old schools of designers at first ignored it, then ridiculed it, but soon realized that it possessed life and power, and had come to stay.

Our art was riddled with styles and conventions; individuality possessed no liberty; designs had to conform to some recognized precedent or were considered a failure; and thus our homes showed little variety in the way of ornamentation.

Those who at first condemned L'Art Nouveau soon became its champions. Like all new ideas and methods possessed of merit,

it passed through the same treatment, but in the end succeeded. The effect of this New Art had been to break down the traditions of the past and to revolutionize the whole of the decorative arts, developing new ideas, methods and features, and applying materials to fresh uses. But whilst deserving so much praise, it was to be hoped that it would not be carried to the excesses of some foreign schools, thereby sacrificing use and comfort to novelty. Owing to the increasing demand for goods executed to the designs of the modern schools, manufacturers had been compelled to fall in line, realizing that unless they did so they would obtain no sale for their goods. The lead in this respect had been taken by many craftsmen who had made a study of the New Art and adopted its principles to their materials, and who had been quickly repaid by the immediate response of the public to appreciate their efforts in this respect.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending January 5th twenty-one failures in the building and timber trades in England and Wales were gazetted.

J. BOND, builder, High Wycombe. First meeting, 1, St. Aldate's, Oxford, Jan. 10th, at 12.

J. W. LUCAS, builder and contractor, Bournemouth. P.E., Poole Town Hall, Jan. 10th, at 10.30.

J. WRIGHT, builder, &c., Bournemouth. P.E., Poole Town Hall, Jan. 10th, at 11.30.

CAVE & Co., builders, Bourne. P.E., Peterborough Law Courts, Jan. 12th, at 12.

A. G. BATTRUM & Co., builders, Crouch End (late Finchley. Adj. Dec. 30th).

J. WATSON, builder, Whitely Bay. P.E., Newcastle-on-Tyne C.C., Jan. 11th, at 11.

F. H. CLARKSON, junr., plumber, Ipswich. R.O. Dec. 29th.

W. H. THOMPSON, painter, Cradley. P.E., Stourbridge C.C., Jan. 15th, at 2.

S. HIPWELL & Co., builders, Wisbech. First meeting, King's Lynn C.C., Jan. 18th, at 11. P.E., King's Lynn C.C., Jan. 18th, at 10.

G. SMITH, builder, East Ham. First meeting, London Bankruptcy Court, Jan. 11th, at 11. P.E., same, Jan. 30th, at 12.

R. SHAW, plumber, Darwen. First meeting, Blackburn C.C., Jan. 10th, at 11. P.E., Blackburn C.C., Jan. 10th, at 10.30.

MARSHALL & Co., builders, London, W.C. First meeting, London Bankruptcy Court, Jan. 10th, at 12. P.E., same, Feb. 9th, at 11.

Coming Events.

Wednesday, January 10.

EDINBURGH ARCHITECTURAL ASSOCIATION (Associates' Section).—Mr. Ramsey Traquair on "Tombs," at 8 p.m.

Thursday, January 11.

MANCHESTER SOCIETY OF ARCHITECTS.—Mr. Hugh Miller on "Architectural Sculpture," at 6.45 p.m.

Friday, January 12.

GLASGOW TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Prof. F. O. Bower, M.A., D.Sc., F.R.S., on "Dry Rot," at 8 p.m.

Monday, January 15.

SURVEYORS' INSTITUTION.—Ordinary General Meeting at 8 p.m.

Tuesday, January 16.

MANCHESTER SOCIETY OF ARCHITECTS.—Debate at 6.45 p.m.

ARCHITECTURAL ASSOCIATION CAMERA AND CYCLING CLUB.—Mr. G. Trotman on "Winchester Cathedral," at 7.30 p.m.

Wednesday, January 17.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. W. T. Oldrieve on "What H.M. Office of Works is doing for Historic Buildings in Scotland," at 8 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Mr. R. G. Hutton on "Jacobean Floral Patterns," at 7.30 p.m.

QUANTITY SURVEYORS' ASSOCIATION.—Adjourned Discussion on Mr. F. B. Hollis's paper, "Some Thoughts on the Quantity Surveyor, and his relation to the Building Owner, the Architect and the Builder," at 7 p.m.

Friday, January 19.

INSTITUTION OF MECHANICAL ENGINEERS.—Meeting at 8 p.m.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Address by Mr. E. C. Middleton.

ARCHITECTURAL ASSOCIATION.—Mr. F. Lynn Jenkins on "The Consideration of Sculpture by Architects," at 7.30 p.m.

Contracts Open.

TO BUILDERS and CONTRACTORS.

The Gas Committee of the Coventry Corporation invite TENDERS for the ERECTION at their Foleshill Works of the following buildings:—

- Weigh Office (one story), 23 ft. by 14 ft.
- Engine and Governor Houses (one story) 24 ft. sq. and 12 ft. sq. respectively.
- Messroom and Stores (two stories) 62 ft. by 20 ft.
- Entrance Gates and Boundary Walls.

Form of Tender, schedule of quantities, specification, and general conditions may be had from the undersigned on payment of one guinea deposit, which will be returned on receipt of bona-fide Tender.

Drawings may be seen at the Gas Works.

The Committee do not bind themselves to accept the lowest or any Tender.

Tenders must be delivered, sealed, on or before first post MONDAY, JANUARY 15th, 1906, endorsed "Tender for Weigh Office, Messroom, &c.," and addressed to the CHAIRMAN of the Gas Committee, Gas Works, Coventry.

FLETCHER W. STEVENSON,
Engineer and General Manager.

Gas Works, Coventry.
December 23rd, 1905.

HANWELL URBAN DISTRICT COUNCIL.

TO CONTRACTORS AND OTHERS.

The Council are prepared to receive TENDERS for SEWERING, LEVELLING, PAVING, METALLING, FLAGGING, CHANNELLING, PROVIDING MEANS of LIGHTING and MAKING UP of the under-mentioned ROAD and FOOTWAYS thereof, within their district, viz.:—

MANOR COURT ROAD—extending from Church Road North to "Beaumont."

The plan, sections, specification and form of Contract may be seen, and bills of estimated quantities and forms of Tender obtained, on payment of one guinea (cheques will not be accepted), which will be returned only to those persons who send in Tenders in conformity with the conditions specified, on application to the Surveyor, Mr. SIDNEY W. BARNES, Assoc. M.Inst.C.E., at the Council's Offices as under, between the hours of TEN a.m. and FIVE p.m., any day after SATURDAY, 30th DECEMBER, 1905.

Sealed Tenders to be delivered here (in envelopes supplied) not later than MONDAY, 15th January, 1906.

The Council do not bind themselves to accept the lowest or any Tender.

Any person, firm or company canvassing any member of the Council will be disqualified for receiving orders or Contracts from the Council.

By Order,
P. J. DENNIS,
Clerk to the Council.
Urban District Council Offices,
Church Road West Hanwell, W.
28th December, 1905.

NOTICE TO OUR SUBSCRIBERS.

THE INDEX OF "THE BUILDERS' JOURNAL."

The Title Pages and Index to any volume of "THE BUILDERS' JOURNAL" may be had free, upon application being made to the Office, Great New Street, enclosing 1d. stamp to cover postage of same.

THE VALUE OF OUR EMPLOYMENT REGISTER.

THIS REGISTER was commenced as a serious endeavour on our part to meet a need that is continually felt both by EMPLOYERS and EMPLOYED, and we are pleased at the practical appreciation that has been shown by our readers since THE REGISTER was first started.

Nothing is more trying than to be out of employment, but the difficulty of the position is terribly augmented when money has constantly to be paid for advertisements in order to find other occupation.

On the other hand an Employer who has just obtained an important contract most likely needs you; and has a post to fill that you are wanting, but neither of you can find each other.

THE REGISTER serves this purpose and so meets both cases. For those wanting employment it is an inexpensive means of keeping their names and qualifications before the right people, and for the Employer it is a ready means of finding just the man he wants, without delay.

We are encouraged to find how largely our columns have been instrumental in meeting the requirements of both parties in the manner indicated above, and we thank those advertisers who have written expressing their pleasure and indebtedness to THE REGISTER.

Many have found it an invaluable aid in getting appointments, and we would urge all those who are out of work, or want to change their situations, in fact, all who have a "want," to make use of these columns and thus make THE REGISTER a record of still more value to Employers and Employed.

For 3s. we give 3 insertions (four lines), in our "Appts. Wanted" Columns, and also 6 insertions in the "EMPLOYMENT REGISTER" (see page xx).

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.
OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.

" 26	Macroom—Sewerage Works	Urban District Council	T. Murphy, Clerk, District Council, Macroom, Ireland.
" 30	Hillingdon—Drainage Works	Rural District Council	Engineer, Corn Exchange, Uxbridge.

List of Competitions Open.

DATE OF DELIVERY.	DESIGNS REQUIRED.	AMOUNT OF PREMIUM.	DEPOSIT REQUIRED FOR CONDITIONS, &c.	FROM WHOM PARTICULARS MAY BE OBTAINED.
Jan. 13	Llanidloes—Public Building	50, 30 and 20 guineas	£1 1s.	W. J. Evans, Llandinam Hall, Llandinam, Montgomeryshire.
" 31	Hackney—Library	£30, £20 and £10	10s. 6d.	W. A. Williams, Town Clerk, Town Hall, Hackney.
" 31	Crompton—Library	£50, £30	—	F. F. Gartside, Clerk, Town Hall, Shaw, near Oldham.
Feb. 15	Wrexham—Schools (W. E. Willink, Assessor)	£25 and £15	£1 1s.	Clerk to Education Committee, Wrexham.
Mar. 20	Bangor—Free Library	—	—	W. H. Worrall, Municipal Offices, Bangor, North Wales.
" 31	Birmingham—Council House Extension (Sketch Plans)	—	—	Town Clerk, Council House, Birmingham.
No date	Coventry—Municipal Offices and Shops (Local Architects only)	£50	—	G. Sutton, Town Clerk, 10 Hay Lane, Coventry.
"	Bangor—New College Buildings (Names only)	—	—	Plans Committee, North Wales University College, Bangor.
"	King's Norton—School (Preliminary Competition)	—	—	J. F. Moore, Education Offices, King's Norton, near Birmingham.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C.

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Canterbury.—For the erection of a new post-office at Canterbury, for H.M. Office of Works, &c. —

	Credit.
Paramor & Sons	£11,300
Amos & Foad	£12
W. H. Martin	10,990
G. Browning	10,750
W. J. Adcock	10,736
Sturly Building Co.	10,466
G. H. Denne & Son	10,348
N. White	10,160
W. Strange & Sons	10,057
Hayward & Paramor	9,943
W. H. Hyde	9,900
G. Barton	9,828
Rowland Brothers	9,800
Gann & Co.	9,733
G. E. Wallis & Sons	9,733
J. Shelbourne & Co.*	9,487
W. K. Grigg	9,474
	9,190
	9,134
	199

* Accepted.

Frinton-on-Sea.—Accepted for the erection of a shop, for Mrs. Mummy. Messrs. Harrington, Ley & Tomkins, architects, Frinton:—

Hawkins & Son £800 |

Frinton-on-Sea.—Accepted for the erection of coach-house and stabling, for Mr. Wheeler. Messrs. Harrington, Ley & Tomkins, architects, Frinton:—

W. Wash £225 |

Hucknall Torkard.—For the erection of a church and schools, Hucknall Torkard, Notts, for the Trustees of the Wesleyan Reform Church. Mr. Harry Spencer, architect. Quantities by the architect:—

Rowland Brothers, Kimberley	£3,564 15 0
Fish & Sons, Nottingham	3,324 0 0
H. Dugham, Basford	3,221 0 0
T. Barlow & Co., Nottingham	3,035 0 0
W. Maule & Co., Nottingham	3,036 0 0
F. Messom, Nottingham	2,986 0 0
J. A. Munks, Hucknall	2,965 0 0
J. Bodill, Hucknall	2,899 18 0
T. Cooper & Sons, Nottingham	2,850 0 0

* Accepted.

Hull.—For alterations and additions to the violent and troublesome and attendants' blocks at the City Asylum, Willerby, for the Asylum Committee. Mr. Joseph H. Hirst, city architect:—

Bowman & Sons £16,100 0 0 |

G. Houlton	£15,984 0 0
G. Eckles	15,500 0 0
A. J. Darneley	15,258 16 6
T. Goates	15,239 0 0
S. R. & T. Kelsey, Goole	15,203 0 0
H. T. Amott	15,197 4 10
Hebblewhite & Wilson	14,485 10 0
E. Good & Sons	14,023 16 6
G. H. Panton	14,000 0 0
G. Jackson & Sons, Witham	13,924 0 0
H. Arnold & Son, Doncaster	13,757 0 0
J. H. Fenwick, Albert Av., Hull	13,775 0 0

* Accepted. [Rest of Hull.]

London, E.C.—For rebuilding Nos. 75 and 76, Lombard Street, for Messrs. Slazenger & Sons. Mr. M. E. Collins, architect. Quantities by Messrs. Batstone Brothers:—

Lawrence & Sons	£15,911
Lascelles & Co.	15,910
Howard	15,700
Kilby & Gayford	15,527
C. Wall, Ltd.	15,450
J. Carmichael	15,409
Waring White Building Co.	15,382
Sheffield Brothers	15,222
Trollope & Colls, Ltd.	15,140
Chessum & Sons	14,929
A. N. Coles	14,825
J. Greenwood, Ltd.	14,803
Howell J. Williams, Ltd.	14,670
W. Downs	14,640
C. P. Roberts	14,550

London, E.—For repairs and decorations at "The Galloway Arms," Limehouse. Mr. Herbert Riches, architect, 3, Crooked Lane, King William Street, London, E.C.:—

J. T. Robey	£490
G. Barker	349
C. W. Staggs	278
Elkington & Sons*	255

* Accepted.

London, S.W.—Accepted for fitting-up two shops at Putney. Mr. Herbert Riches, architect, 3, Crooked Lane, King William Street, London, E.C.:—

Courtney & Fairbairn £247 10 0 |

London, N.W.—For alterations and additions to the Grange, West Heath Road, Hampstead. Messrs. Inman & Sturdee, architects, 7, Bedford Row, W.C. Quantities by Messrs. Smyth & Dearle, 7, John Street, Adelphi, W.C.:—

Ryder & Son	£10,762
Melbourne	10,307
S. S. Scott	10,147
J. Simpson	10,010
J. Dorey, Ltd.	9,700
Kilby & Gayford	9,483
J. Smith & Sons	9,289
W. King & Son	9,000
G. Godson & Sons	8,967
Miskin & Sons	8,960
Holland & Hannen	8,888

London, N.E.—For repairs and decorations at "The Mitford Tavern," Hackney. Mr. Herbert Riches, architect, 3, Crooked Lane, King William Street, London, E.C.:—

W. Irwin	£704
J. T. Robey	502
T. Osborn & Sons	410
Elkington & Sons	381
A. W. Derby*	368

* Accepted.

London, N.E.—For decorations to shop premises, Chatsworth Road, Homerton. Mr. Herbert Riches, architect, 3, Crooked Lane, King William Street, London, E.C.:—

A. W. Derby	£146 0 0
F. Parsons & Sons	128 10 0
Elkington & Sons	128 0 0
T. Osborn & Sons*	108 0 0

* Accepted.

Reading.—For the enlargement of Reading sorting-office, for H.M. Office of Works, &c. —

	Credit.
W. Jones	£2,595
W. Hawkins	£80
F. J. Stanbury	2,476
A. Faulks	2,391
W. T. Toogood & Co.	2,381
R. Curtis	2,250
G. H. Tucker	2,165
H. W. Godwin	2,165
Batten Brothers	2,137
W. H. Hyde	2,030
G. Pilgrim	1,986
Martin, Wells & Co.	1,979
G. E. Hughes	1,967
A. J. Colborne	1,910
McC. E. Fitt*	1,891
	1,774

* Accepted.

Southampton.—For rebuilding "The Old House at Home" public-house, and stabling, Shirley, for Messrs. Scarses Brewery Co., Ltd. Mr. A. A. Burnett, F.S.I., architect, 2, High Street, Southampton:—

Exors. of W. Franklin	£1,686
Rasley & Son	1,600
H. Stevens & Co.	1,556
Jenkins & Sons	1,545
A. Doggrell & Son	1,525
H. Cawte	1,509
Dyer & Sons	1,500
A. Wright & Son*	1,460

* Accepted. [All of Southampton.]

Southampton.—Accepted for reconstructing ice-lofts and stores, 16 and 17, French Street, and building additional offices at 124, High Street, for the Consumers Ice and Supply, Ltd. Mr. A. A. Burnett, F.S.I., architect, 2, High Street, Southampton:—

H. Cawte, Southampton £1,100 |

(Continued on p. xviii.)

The LEEDS FIRECLAY Co., Ltd.

STONEWARE

DEEP SOCKETTED PIPES

2 in. to 42 in. Diameter.

Manufactured by the following Branches:—

JOS. CLIFF & SONS, LEEDS. Telegrams: "CLIFF, WORTLEY." Nat. Tel. 612 and 1649.

WM. INGHAM & SONS, LEEDS. Telegrams: "INGHAMS, WORTLEY." Nat. Tel. 611.

THE WORTLEY FIRECLAY CO., LEEDS. Telegrams: "ENAMEL." Nat. Tel. 532.

OATES & GREEN, Ltd., HALIFAX. Telegrams: "BRICKS, HALIFAX." Nat. Tel. 700 and 701.

E. BROOKE & SONS, HUDDERSFIELD. Telegrams: "FIELDHOUSE." Nat. Tel. 109.

London Address: 2 and 3, Norfolk Street, Strand, W.C.

TENDERS—cont. from p. xvi.

Sheffield.—For the erection of a residence in Graham Road. Mr. G. Malam Wilson, architect and surveyor, 37, Surrey Street, Sheffield. Quantities by the architect:—

J. H. S. Randall	£3,150	0	0
Smith & Nunn	2,500	0	0
T. Gray & Sons	2,216	0	0
Abbot & Bannister	2,175	0	0
D. Smith	2,003	0	0
Badger & Appleby	1,957	0	0
H. Broot & Son	1,913	0	0
J. Richerby	1,912	7	0
J. & H. Wheen	1,500	0	0
H. Kyme	1,899	0	0
E. B. Dyson & Son	1,871	16	0
W. & A. Forsdyke and Johnson & Appleyard	1,869	4	0
E. & W. Oxley	1,867	0	0
C. Portass	1,866	0	0
B. Powell & Son	1,860	0	0
C. Ward	1,815	12	7
J. T. Robertson	1,800	0	0
E. Moore	1,768	0	0
A. Bradbury	1,755	0	0

* Accepted subject to slight revision.

Southampton.—For alterations and additions to Meira House, Above Bar. Messrs. Hair & Bucknill, architects, Southampton. Quantities by Mr. C. I. Hair:—

Lawrence	£1,300
Jenkins & Co.	1,295
Long	1,260
Dyer & Sons	1,200
Bagshaw & Son	1,195
Wright & Son	1,194
Stevens & Co.	1,193
J. Nichol	1,137
Golding & Ansell	1,137
Rylands Brothers, Shirley	1,023

Sutton.—For the erection of a new post-office at Sutton, for H. M. Office of Works, &c.:—

W. Hopkins	£5,690
J. Longley & Co.	5,589
H. C. Payne	5,446
F. & E. Davey	5,260
J. Burges & Sons	5,227
Marrion & Salter	5,100
Martin, Wells & Co.	5,029
Drowley & Co.	4,999
Copley Brothers	4,993
Gathercole Brothers	4,990
E. P. Bulled & Co.	4,975
W. H. Hyde	4,968
C. Ansell	4,900
F. & G. Foster	4,870
F. J. Shopland	4,760

W. Smith & Sons	£4,748
J. Appleby & Sons	4,736
Braid, Pater & Co.	4,697
J. Shelbourne & Co.	4,614
F. Gough & Co.	4,590
R. Jones & Son*	4,554
J. F. Holliday	4,373
F. G. Lawrence	4,199

* Accepted.

Walsall.—For the erection of a new school for 336 senior boys and girls, with out-offices, together with a manual training centre for twenty boys, on a site at rear of present schools, Hillary Street, Walsall, for the Education Committee. Messrs. Bailey & McConnal, architects, Bridge Street, Walsall:—

G. H. Marshall, Stourbridge	£3,967
W. & J. Webb, Birmingham	3,690
Smith & Son, West Bromwich	3,685
W. Tapcote, Birmingham	3,666
G. Insley	3,638
T. & F. Wootton, Bloxwich	3,625
G. Webb, Handsworth	3,535
E. Mallin, West Bromwich	3,520
H. Willcock & Co., Wolverhampton	3,507
W. Listance	3,498
F. L. Jones, Wolverhampton	3,420
J. Herbert, Wolverhampton	3,400
J. Dallow & Son, Dudley, and W. Kendrick & Son	3,390
J. Barnsley & Son, Birmingham	3,388
T. Mason, Hednesford	3,345
T. & J. Ham, Wolverhampton	3,340
G. Guest & Son, Stourbridge, and T. Hall & Son	3,330
T. Hardy, West Bromwich	3,295
T. Tildesley, Willenhall	3,294
Brockhurst & Wood, Walsall, and G. E. Jackson, Oldbury	3,250
H. Gough, Wolverhampton	3,200
S. Wootton, Bloxwich	3,063

* Accepted. [Rest of Walsall.]

Messrs. Mellows & Co., Ltd., of Corporation Street, Sheffield, have secured the order for glazing on their patent imperishable "Eclipse" system the roof of the Newcastle-under-Lyne baths, Dixon's new mills at Grimsby, new sawmills at Malta, and extensions of works of the Northern Co-operative, Ltd., at Aberdeen and the Butterly Iron Works, Ltd., at Derby.

ROOFING SLATES:
Velinheli, Penrhyn, and Westmoreland.
SLATE SLAB GOODS:
Both Plain and Enamelled.

ALFRED CARTER & CO., LIVERPOOL.

ALL ARCHITECTS, BUILDERS, &c.,
SHOULD USE THE
BLACK AUTOCOPYIST.

Invaluable for the reproduction of Plans, Specifications, Circulars, &c., in permanent black
From 35s.

THE AUTOCOPYIST Co.,
R. Dept., 64, Queen Victoria Street, London, E.C.

**I WANT
TO GIVE YOU A
BETTER POSITION
AND BETTER PAY.**

I know I can do this for you by our successful system. We give you the right training to enable you to leave the overcrowded and poorly-paid trades, where the supply always exceeds the demand, where the unemployed question is prominent, and enter the paying and up-to-date profession of Electrical Engineering. We have done this for thousands, and can do the same for you. We train you by post, in your spare time, direct to your home, and at little cost to yourself.

I SEND YOU FREE

our interesting book, "How to Become an Electrical or Mechanical Engineer." It tells you the story of success in life, and gives you convincing proof that I will carry out what I state. We train you in Electrical Engineering, Electric Tramways, Electric Light and Power, Dynamo Tenders, Mechanical Engineering, etc., etc.

Don't miss this opportunity—it is too good to lose—but write to-day for this free book to SECRETARY,

ELECTRICAL ENGINEER INSTITUTE OF
CORRESPONDENCE INSTRUCTION,
444, Norwich House, Southampton St.
HOLBORN, LONDON.

Substitution of Materials. THE building contractor receives a great deal of public opprobrium, but the sins of the black sheep in this trade are as nothing to the deceit which is practised in respect to the supply of materials. Some specialist firms seem to be in league to hoodwink the profession so as to be able to carry out a regular series of substitutions. The granite trade is one wherein such deception is often practised by firms large enough to be above such disreputable methods. The asphalt trade is another where the sources of supply are very little known, and the firms juggle with the materials from different mines just as the price or quantity available warrants. The paint, varnish, marble, slate and ironmongery trades are all open to similar criticism, while the same thing applies to specialist contractors who carry out such work as fireproofing and steelwork. These latter are often required and expected to do their work in the best manner and to work up to an accepted standard, yet if they have to compete rather closely with others (or perhaps because of their private finances being insecure) they do not scruple to substitute inferior work. Of course this is always bound to occur in all trades, but why we think it is particularly objectionable in the building trades is that firms of standing do not use their efforts to counteract the unscrupulous traders. Some large firms, indeed, are not honest themselves. The course of those who desire to break away from this practice is quite plain. They need only let the architectural profession know the true facts of the matter. We would ask them to state the sources of supply that are available at any moment, the quantity of materials that are in stock, and, in such a case as marble or granite work, to state what quarries have had their best material so worked out that it could not be used for a large job. Then they ought to clearly classify their first, second and inferior qualities of goods and so set up a standard by which there could be fair competition. Many mushroom firms rise nowadays and secure a considerable amount of work by methods which cannot be called anything but bluff. Not only the architectural profession but building contractors are constantly being hoodwinked. Very often they find out only too late that they have been deceived, but more often they do not discover the substitution, and the building owner or successive tenants are left to grin and bear it. A good many commercial travellers and principals of businesses are extremely plausible, and express their readiness to repair the little "mistakes" they are not above readily admitting, but at the same time they gently hint that the correction will take time—in fact, such a time that the building could not be delayed for this—and they know well enough that they will never be called upon to do the work. We would suggest that architects should be a little firm

with these gentlemen and hold them to their contract, and sue them for any breach of it. One or two examples of this kind might effect some reform. But we rely more upon the intentions of the majority of the members of the building trade to remove this stigma, the existence of which we believe is due more to apathy and inheritance than to any desire to practise dishonesty.

The Modern Arch. THE "theory" of arch design remained in an elementary state until the last century, when engineers were led to examine critically into all structural means in order to fit conditions of modern industry. They took the masonry arch and developed it a certain way, but they went little further than the greatest of the older builders, though they raised the average. Their empirical inelastic arch theory assumed the arch stones to be rigid and required the line of resistance within the arch ring (for safety within the middle third). In the latter part of last century, however, the theory of arch design began to advance again, particularly with Continental engineers. The construction of arches in metal marked the point of departure. The theory of elastic flexure was then applied to the theory of the arch, and the arched rib came into being. Instead, then, of it being a necessity for the line of resistance to be confined to the arch ring, it was easy, at small sacrifice of economy of metal, to stiffen the arch ring against flexure. This was now required to resist combined thrust and bending (with shear as a corollary). This is the elastic flexure theory of arch design. The older inelastic theory had led to the adoption of pin and similar joints at the crown and springing so as to give greater precision in design or to afford control of the line of resistance. The pin joints simplified the modern elastic flexure theory by allowing unknown quantities to be exactly determined, just as the fixing of one end of a roof truss and the freedom of the other simplifies the theoretical determination of stresses in such structural members. With the two-hinged arch (pin joints here being at the springing) or the three-hinged arch (a pin joint here being at the crown as well as at the springing) the analysis of stresses must be so conditioned as to make bending moments zero at the pin joints, whatever may be the condition of loading. This flexure theory has increased the range of the arch to immense spans. The Clifton Arch rib bridge at Niagara has a span of 800ft. The arched rib, too, is a graceful form of construction, and is much superior in line to the truss and cantilever, and we may therefore look forward to the future development of engineering structures with more equanimity than formerly. The modern theory of arch design finds its architectural application in reinforced concrete, of which there are examples with and without hinges.

A SHORT ANALYSIS OF ORNAMENT.

THE first decorations of surfaces appear to have been in stripes, partly because of greater facility in weaving narrow bands rather than broad widths and partly because a stripe defines a field in one direction only, making it possible to represent continuous action but not diffusing it.

Stripes

are closely associated with borders. Especially interesting striped patterns are to be found in Egyptian wall decoration, upon Greek vases, around Byzantine panels, and in the mouldings of all styles.

Chequers and Diagonals.

The chequer is common to all people, and is the simplest of geometric patterns.

The simplest of the diagonal line patterns are the zigzags, so strong and vigorous, though somewhat crude in effect. These are often to be found associated with chequers, and are especially prevalent in the so-called Romanesque mouldings; they are usually indicative of virile but unsophisticated work.

Parapet Patterns.

The parapet patterns and key patterns appear to have had an Oriental origin from the use of bricks in building and are to be found in all Oriental work from India to Morocco. They have been used in the European styles at times, but only in an imitative manner.

Frets

were so associated with Greek design that they are known as Grecques. Varieties of them appear in Japanese and Chinese design, and also in Mexican, but the fully developed fret is a thoroughly classic motive, and is scarcely to be found in decorative design between the fifth and fifteenth centuries until the Renaissance again establishes its use. Labyrinth patterns take the place of the fret in China; and the Swastica, or crossed key, which is often an integral part of a fret, is a Buddhist symbol.

In analyzing designs based upon curves it will be found that

The Circle

is the prolific source of motives. The circle has from the first been symbolic, and is the simplest and most conspicuous of all decorative spots. It found its place in the vocabulary of design at a very early date, although not appearing until chequer and triangle designs were well established. It is to be found in Egyptian and Assyrian ceiling patterns, in classic discs and rosettes, and especially in all early textiles, by far the larger proportion of which up to the tenth and eleventh centuries are based on wheel or circle patterns. From its association with the form of the arch it becomes one of the major architectural spaces from the time of the Romans.

The circle has strong

Capacity for Setting Scale

in design, and in all ornament in which it is introduced it naturally affects the relative scale of forms associated with it. Semicircles in parallel lines in the same direction produce scale patterns, and by interlacing produce the Guilloches, both of which are admirable foils for more complicated ornament. Alternation of semicircles in opposite directions produces meanders, which, if opposed, become the meneau, which is one of the universal patterns in textiles and dropped repeats. Portions of circles in one ratio, connected and progressing in one direction, form spirals, scrolls, and volutes. Scrolls appear first at an early date upon Egyptian seals and develop rapidly into wave and linked patterns and elaborate all-over patterns, but seldom appear as interlaces. The wave pattern is especially associated with Greek design, and disappears with the decline of Classic art, to reappear in the

Renaissance. The voluted designs attain their highest specialization in the Ionic capital. The opposed meander or meneau is the principal motive for Oriental wall surfaces from the eighth century, and becomes the motive for textiles in Europe in the fourteenth century. The radial motive is of a distinctly higher type than any of the preceding motives. It possesses all the

elements inherent in geometric design, and is dependent upon rhythm, which is not the case with the other systems. Rhythm may be defined as expression of motion caused by the action of some dominant force. The factors of a radial motive are rhythmical, both to each other and to the whole. The acanthus is the most thoroughly developed of the radial motives.

BRIGGS AND WOLSTENHOLME, F. B. HOBBS AND ARNOLD THORNELLY, ARCHITECTS.

THE THEORY OF PROPORTION IN ARCHITECTURE.

By C. B. Hutchinson, A.R.I.B.A.

THE papers by Mr. Claude Bragdon in THE BUILDERS' JOURNAL for October 25th and November 15th last open up an interesting point as regards the methods of proportion adopted in the early days of architecture. It must, however, be borne in mind that, though certain squares and equilateral triangles happen to fit in with the leading lines of a design, it does not necessarily follow that such were in the mind of the designer at the time. At the present day a building has complete accurate drawings prepared beforehand, but it is very doubtful as to how far this was the case even in mediæval times, and more so in Gothic work than in Classic or Renaissance. Again, the effect of perspective alters the proportion, for a building is seldom seen in true elevation.

It is clear, however, that the plans of ancient buildings were laid down to certain lines of simple proportion, such as 1 to 2, 2 to 3, and so on, the square and cube being often used, but, as Michael Angelo remarked, an architect must have a compass in his eye, not merely in his hand. Vitruvius and Alberti gave us their ideas of comparing simple proportions to notes and harmony in music, which are beautiful ideas in themselves. In music the vibration of sound produces harmony, or discord, for practical reasons regarding the wave lengths, but does this fully apply in a design except as regards the regular spacing of columns and other features in a Renaissance palace?

Harmony has been defined by Aristotle and Vitruvius in much the same terms as "the union of component parts having a ratio to each other," and this is of considerable importance in a design.

The Human Standard.

To get at the root of any matter one must trace it back to the earliest times. Here we have several motives—(1) those based on the proportions of the human figure, (2) certain numbers to which a mystic value was attached, (3) certain simple proportions in the main lines of a plan or design of a building which were repeated in its smaller component parts. The human figure has been taken as a basis, especially in all sacred buildings. So our digits represent the fingers held up for counting, and the V is the shape of the whole hand of five fingers. We use the palm, hand, foot span and cubit as standards of measurement, while the square is a man with extended arms.

Vitruvius based his book on authors whose works have unfortunately been lost, but both he and Alberti lay stress on the fact that all sacred buildings should be based on the proportions of the human body. These have been laid down from the earliest times as being, for a man's breadth to height, as 1 to 6, and depth, from chest to back, compared to height as 1 to 10.

Now the earliest structure of which we have any record is

Noah's Ark,

and if we refer to the account (Genesis vi. 15) we find "the length shall be 300 cubits, the breadth 50 cubits, and the height 30 cubits," or the breadth and length as 1 to 6 and the height to length as 1 to 10—that is to say, the precise proportions of a human body floating in the water. This is an interesting point, and one which the writer has never seen referred to before.

Again, the human figure is a column, and we find it used as such in Egyptian temples and in the Greek caryatides. Now, the earliest columns were in breadth to height as 1 to 6, or six diameters high, which is probable for the same reason as set out above: it might also be that a man stands upright and is 6ft. high.

The descriptive Biblical account both of

The Tabernacle and Solomon's Temple

contain many points of interest. All the instructions laid down were so definite as to clearly point to a prearranged scheme. The main length was usually 100 cubits, subdivided into units of 10 for the spacing of columns, &c. The orientation was east and west. In Exodus xxxviii. 10-19 we find the dimensions of the hangings and pillars all in the proportion of 1 to 5 and a unit of 5 cubits, which is interesting, as Alberti tells us that "ancient philosophers regarded 5 as a mystic number." On the north and south sides the hangings were 100 cubits and the pillars 20, or 1 to 5; while on the east and west sides the hangings were 50 cubits and pillars 10, or 1 to 5. The hangings on both sides of the gate were 15 cubits and pillars 3, or 1 to 5, and around the gate of the court the hangings were 20 cubits and the pillars 4, or 1 to 5. Then, again, in Solomon's temple (1 Kings vi. 31) we read "the lintol and side posts of the Oracle were a fifth part of the wall." Solomon's house of the forest of Lebanon (1 Kings vii. 2) was of the same dimensions as the Tabernacle of Moses, 100 cubits long by 50 broad, or 1 to 2, the breadth of 50 cubits being divided into five spaces or aisles by four rows of columns, or, again, 1 to 5: all working to a unit of 10 cubits. It is interesting here to compare Brunelleschi's Church of San Spirito at Florence, which is cruciform on plan, the proportion of breadth and length being as 1 to 2 and the breadth of the nave to its length as 1 to 6, or the proportion of the human body in this respect.

Certain numbers have in the earliest times been regarded as having a mystic value, especially the numbers 6 and 28 and the cube of 6, namely, 216, as these are the only two numbers which equal the sum of their divisors, 1, 2, 3 = 6 and 1, 2, 4, 7, 14 = 28. Is it a coincidence that, though all the dimensions of the Tabernacle and Solomon's temple are in multiples of 10 or 5, yet the curtains enclosing the Tabernacle—the main vertical dimension—were 28 cubits high (Exodus xxvi. 2 and xxxvi. 9); and in Bramante's design for St. Peter's at Rome (Guymuller, R.I.B.A. Trans., 1891) the main similar dimension for the nave and arcade supporting the cupola was 216 palms, which, after careful consideration, he believed was adopted for the same reason—as being the cube of 6.

Solomon's temple (1 Kings vi. and vii.) and the house of the forest of Lebanon were of different proportions. The temple was 60 cubits by 20, or 1 to 3, and 30 cubits high, or 1 to 2, the porch being 20 by 10 cubits, or 1 to 2. The house of Lebanon was 100 by 50 cubits, or 1 to 2, and 30 cubits high, as in the former case, the porch being 50 by 30 cubits. It should be noticed that the porch was in each case the whole width of the temple, which was usual in all Classic work, both Greek and Roman, and entirely different to Gothic cathedral porches. The chambers around the temple were of increasing size, being 5, 6 and 7 cubits broad, the Oracle itself (1 Kings vi. 20) being a perfect cube of 20 cubits each way—the same breadth as the temple. The cube has always been regarded as having special virtue in its perfect equality of dimensions. The cherubims in the Oracle were both 10 cubits broad, with two wings of 5 cubits each, or 20 cubits in all, and so stretched from wall to wall across the chamber.

All the minor dimensions for these two buildings and their fittings were according to a careful plan, usually of 10 or 5 cubits or proportionate sub-divisions; even the stones for the foundations were 10 cubits long. The whole Biblical account is found on examination to be that of a scheme of proportion in plan, and in squares or cubes in design.

The Proportions of Greek Architecture

have been already considered by so many writers as hardly to require repetition. From Greece, architecture was transplanted to Rome, but in the change from Biblical times to Roman an entirely new set of factors came in, altering the previous simplicity of proportion. The "Orders" of architecture, Doric, Ionic, Corinthian, &c., with their complicated proportions for height of columns, intercolumniation and minor details, altered the simplicity of earlier times, but it is interesting to find that these rules were based on certain simple principles; for instance, that the weight supported by a column should be only the weight of that column, or that the areas of the two should be equal, which at once regulates the spaces between the columns for the different "Orders." Again, when one "Order" is over another the upper diameter of the lower column should equal the lower diameter of the upper column, and so give a gradual diminution.

Mediæval and Renaissance Methods.

Coming now to the Renaissance, Vasari tells us how Brunelleschi, Bramante and Leonardo da Vinci used to work on paper ruled in squares, describing it as "a truly ingenious thing, and of great utility in the work of design," and by this they set out proportions on plan, &c., to a definite scheme—in reality similar to the method adopted in Biblical times.

As an illustration of the importance attached to the principles of proportion in a sacred building in mediæval times, we find, from a letter of Delle Valle, that on February 14th, 1321, a commission of five persons was appointed to enquire into the building of Siena Cathedral, which was then just begun, but which did not appear to be based on a proper system of proportion in length, breadth, height, &c., though the previous building did possess a careful scheme.

It is a question how far symbolism or any value in certain numbers held its ground in later times, but a system of proportion certainly did.

With Renaissance architecture a further set of factors was introduced, which again complicated the plans of buildings. Alberti in his book (vol. 2, p. 60) gives a design for a tower showing his ideas for its general proportions. It consists of six storeys, in a sequence of "Orders." The lowest storey is a perfect cube and each of the other storeys is $\frac{1}{2}$ of the storey below, or diminishing practically in the proportion of 8, 7, 6, 5, 4, 3, allowing in each case for the amount hidden by the projection of the cornice below; each "Order" to the storey being accurate as regards column entablature, &c. It is of interest to compare this with Ruskin's idea in his "Seven Lamps" where he takes the case of a plant called *Alisma Plantago*, in which the various branches diminish in the proportion of 7, 6, 5, 4, 3 respectively, and so carry out the same idea; on which Ruskin observes that the diminution in a building should be after the same lines as Nature. The idea of diminishing all the upper storeys is only a natural one. Every tree and plant divides from a main stem to its branches. A column diminishes for the same reason, to give the idea of mass at the base to support the weight. The walls of an Egyptian temple often taper for the same reason. A campanile, which has parallel sides, carries out the same idea, by almost always having the lower windows in single lights, with two, three, four or more lights in the storeys above. In Giotto's campanile and many other towers the upper windows are much larger and longer than the lower ones, to give the idea of lightness in the upper part. For the same reason the quoins or angle stones in the Farnese Palace at Rome diminish in size in the upper part.

The façades of Renaissance palaces do not

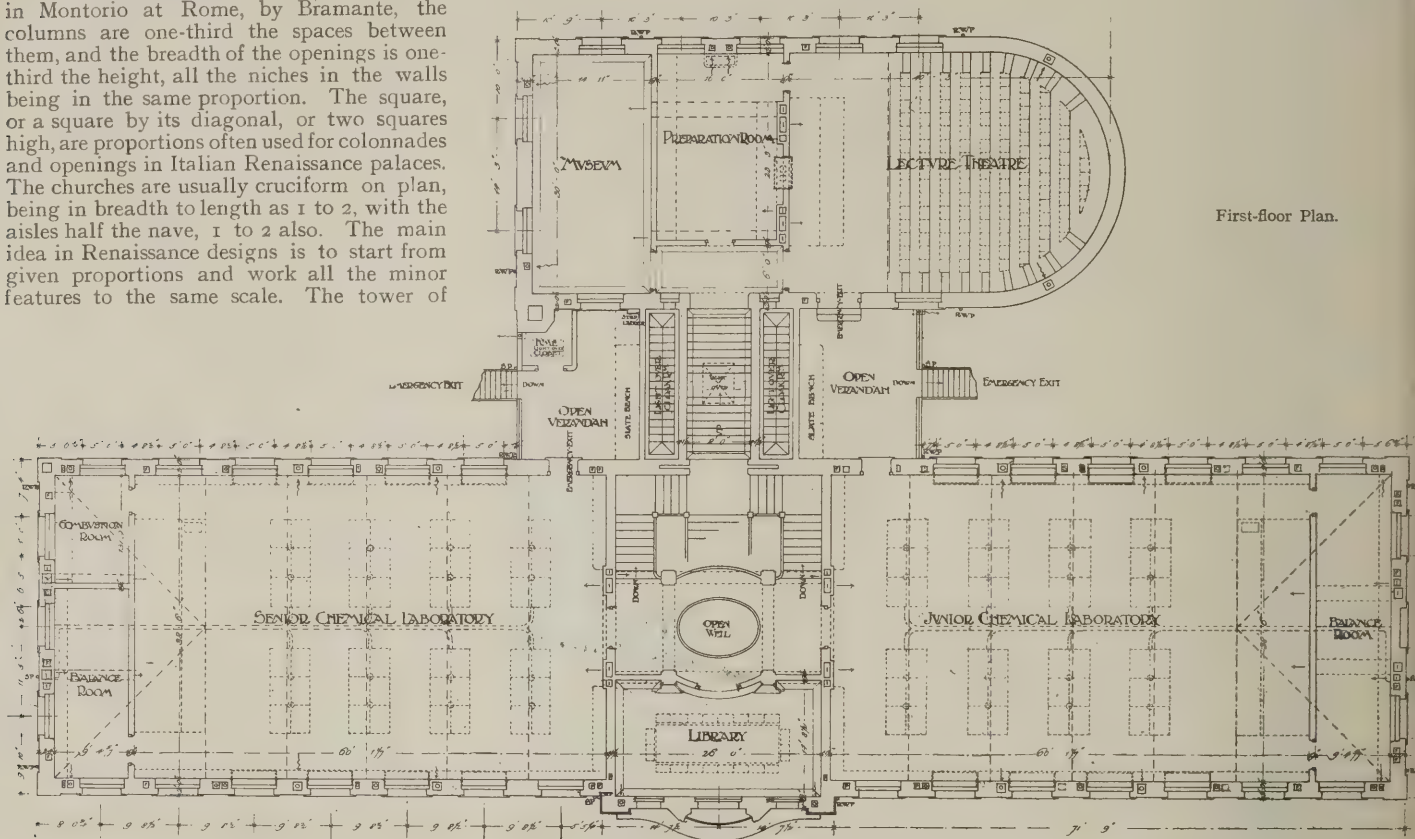

follow any invariable rule. The Rucellai Palace at Florence, by Alberti, has three storeys of equal height, raised on a base, the same height as the entablature. The Riccardi Palace at Florence, by Michaelozzi, like many others, has three storeys diminishing in the proportion of 5 to 3. Sometimes we find a lofty lower storey and the two upper ones equal.

At the beautiful little chapel of S. Pietro in Montorio at Rome, by Bramante, the columns are one-third the spaces between them, and the breadth of the openings is one-third the height, all the niches in the walls being in the same proportion. The square, or a square by its diagonal, or two squares high, are proportions often used for colonnades and openings in Italian Renaissance palaces. The churches are usually cruciform on plan, being in breadth to length as 1 to 2, with the aisles half the nave, 1 to 2 also. The main idea in Renaissance designs is to start from given proportions and work all the minor features to the same scale. The tower of

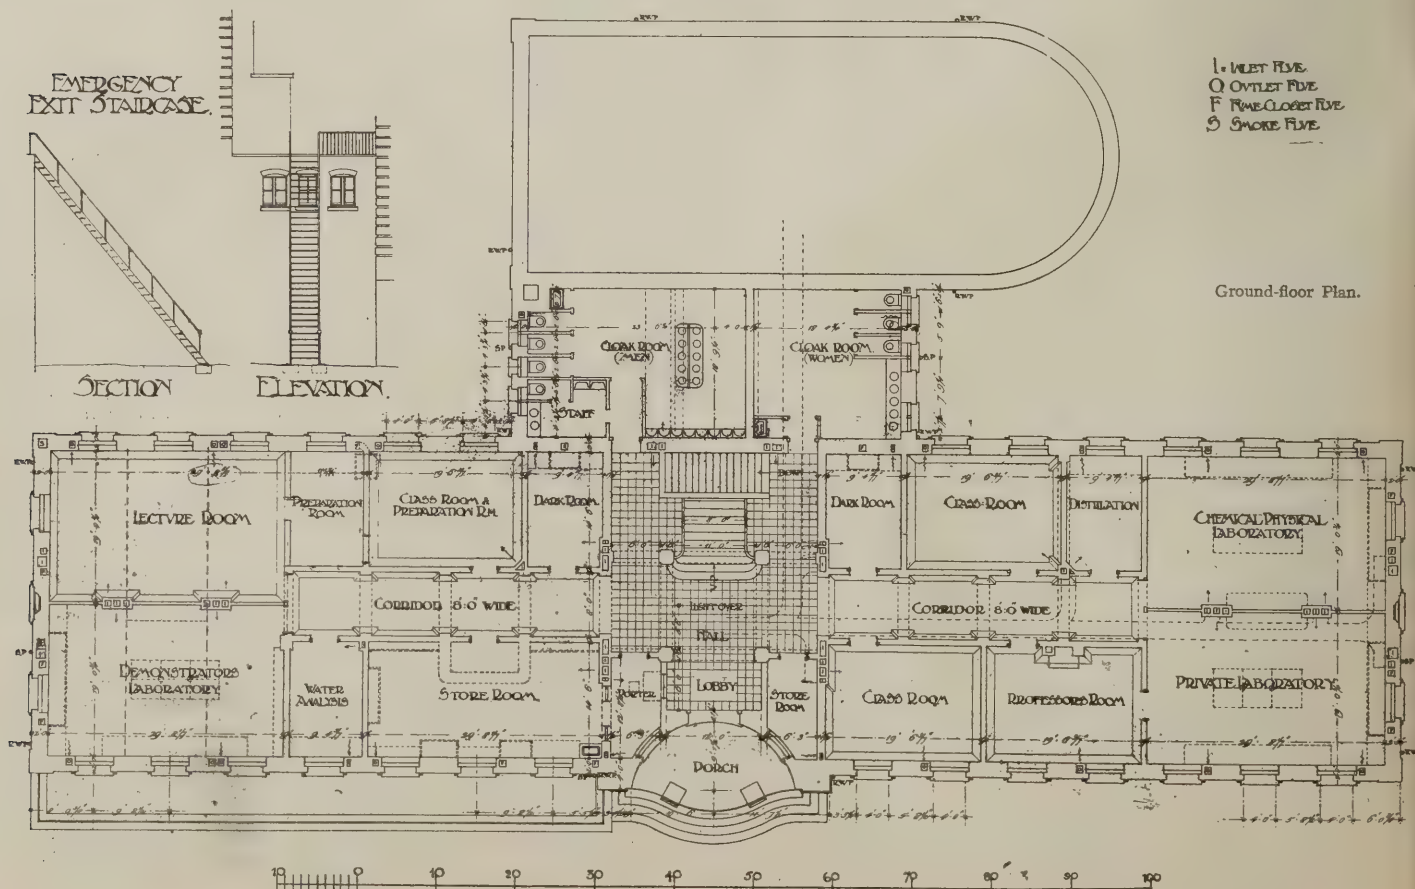

S. Spirito at Rome (c. 1490) is a good instance, the proportion of 5 to 9 being the keynote. The lower storey is in breadth to height as 5 to 9; the window opening in that storey is as 5 to 9 to correspond; and the lower storey is as 5 to 9 of the first two; the upper one being a repetition of the middle one. In all the pure Italian Renaissance designs there is a carefully arranged sequence and repetition of proportion in the main

outline, a crowning cornice being often proportioned to an imaginary "Order" the height of the whole building, as Palladio so often adopted.

These are just a few notes on a subject which deserves careful analysis. In the earlier times symbolism and mysticism may have taken a large share in guiding the lines of a building, but throughout all the beauty of good proportion has been always recognized.

Law Cases.

Employers' Liability. — In the City of London Court last week a labourer named Bunce sued his late employers, Messrs. Turnbull & Son, builders, for £30 damages for personal injuries sustained by him while pulling down a warehouse at Dockhead. A piece of concrete weighing 2 tons fell and carried with it a large chisel which the plaintiff held, and his thumb was torn to the root. For twelve weeks he was unable to work. The plaintiff said that the arches on which he worked should have been shored, and his counsel said he had been offered the "very meagre pittance" of half his wages of 30s. a week under the Workmen's Compensation Act. He now claimed "something like commensurate compensation" under the Employers' Liability Act. The defendants said no accident of the kind had ever occurred before, and the plaintiff had no claim under the Employers' Liability Act. Judge Lumley Smith, K.C., deprecated needless actions under the Employers' Liability Act, as he felt these were often brought, it being thought that the employer would sooner pay than fight, knowing that if the workmen lost they would put the employers to costs. The jury found for the defendants, and the plaintiff was then awarded £8 under the Workmen's Compensation Act, less £3 towards the defendants' costs of the action under the Employers' Liability Act.

OUR PLATES.

SIX years ago Glasgow decided to erect and maintain public libraries in the different districts of the city, and had prepared and was carrying out this scheme when in 1902 Mr. Carnegie came forward and offered £100,000 to build libraries. This handsome gift was accepted, and enabled Glasgow to still further elaborate its scheme, which, when completed, will make the city one of the best equipped with libraries in the kingdom. One of these libraries is that for the district of Govanhill and Crosshill, illustrated as a centre plate this week. The design, by Mr. James R. Rhind, architect, of Glasgow, was selected in public competition. There was space on the ground available, and consequently all the rooms required were planned on the ground floor only. This is found by librarians to be the most advantageous arrangement, because better work can be done and at less cost. The general reading-room, ladies' reading-room and

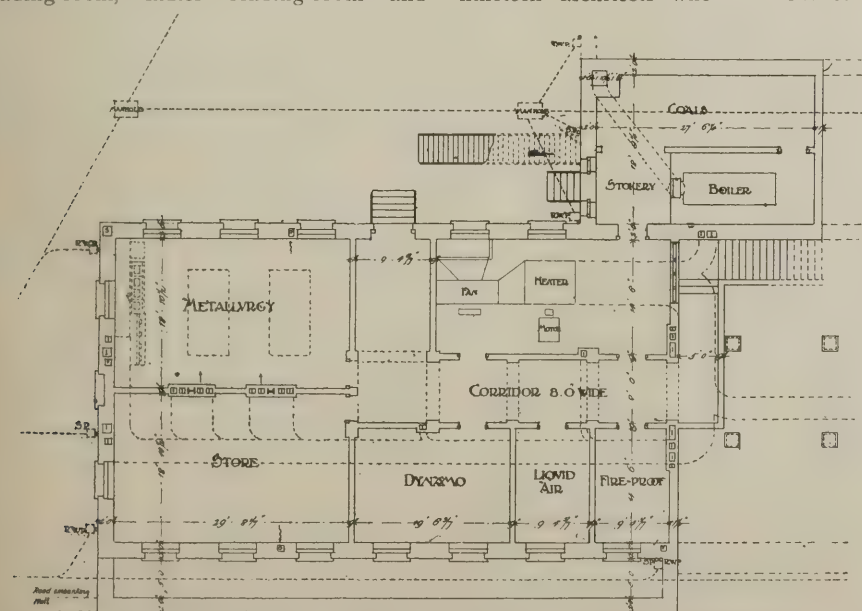

library all enter off the entrance hall. The children's reading-room is entered from a separate porch and doorway. The building is heated by hot-water radiators, and the foul air is extracted by electric fans conveniently placed. The fittings are of polished mahogany.

The design for the Davies' Memorial Laboratories at University College, Aberystwyth, by Mr. Alfred W. S. Cross, F.R.I.B.A., of London, was selected in competition (for which there was no professional assessor, the selection having been made by the council of the college). In the first instance nineteen architects who had carried out

collegiate or technical school work were invited to submit drawings of their past work of this description to the council. From these nineteen applicants, two architects were asked to compete for the Aberystwyth building on the understanding that the successful man was to be entrusted with the work and the unsuccessful one was to be paid an honorarium of 100 guineas. The disposition of the rooms in Mr. Cross's building is shown by the accompanying plans. The contractor for the work is Mr. Henry Willcock, of Wolverhampton, whose tender is for £25,000. Local stone is to be used for the general walling, with stone dressings from Grinshill Quarry near Shrewsbury, and Westmorland green ton slating for the roofs.

COLONIAL HOUSE, LIVERPOOL.

THIS building, illustrated on p. 30 of the present issue, was completed towards the end of last year for the well-known firm of Elder, Dempster & Co. It occupies a rectangular piece of ground at the corner of Water Street and Tower Gardens, the frontage to the former being 81ft. 6ins. in length and to the latter 203ft. 6ins. The façade to Tower Gardens is of white enamelled bricks and the main frontage to Water Street of Cefn stone, the base of the building and the columns being of red granite. The main office of the company on the ground floor measures 140ft. by 70ft., extending the entire width of the building. It is lighted from both sides and also by seven domes. The furnishing throughout is of mahogany and the floor rubber-covered. Two principal staircases, of stone, give access to commodious offices on the upper storeys. The architects of the building were Messrs. Briggs & Wolstenholme, F. B. Hobbs and Arnold Thornely, of Liverpool.

Notes and News.

"One and All Gardening for 1906" has just been issued from 92, Long Acre, W.C., price 2d.

Mr. F. W. Pomeroy, the well-known sculptor, was elected an A.R.A. last week. Mr. Pomeroy is at present engaged on the four large panels for the new Lambeth bridge.

White Sandstone in Canada.—What is said to be the only deposit of white sandstone in Canada is now being quarried at Simpson Island, in the Nepigon Bay. Before the discovery of this deposit all white sandstone was shipped to Canada from Ohio or imported from Scotland.

The Southport Foreshore is to be improved by the development of the Corporation estate on the north, at a cost of £1,000. A number of new roads are also being constructed, and the Winter Gardens pavilion is to be extended to accommodate 3,000 persons.

A new Bridge across the Ganges has been constructed. It is named the Curzon Bridge (in accordance with the custom by which the name of the Viceroy is bestowed upon the most important bridge constructed during his term of office) and has fifteen spans of 200ft. each. The cost was £250,000.

Secondary Schools, Aylesbury.—In the list of contracts open given on p. xiii of our issue for last week Messrs. W. T. Farthing & Son, of London, W.C., were mentioned as the architects of these schools. This is not so. Mr. Fred Taylor, A.R.I.B.A., of Aylesbury, is the architect, Messrs. Farthing being the quantity surveyors only.

A Carnegie Library at Bideford has been built from designs by Mr. A. J. Dunn, of Birmingham (selected in competition). The contractor was Mr. Henry Glover, his tender amounting to £5,492. The frontage of the building is in Bridge Street and facing East-the-Water and bridge. The formal opening will take place on February 6th, when the Kingsley Memorial is also to be unveiled.

M. Auguste Saint-Gaudens, elected an Honorary Foreign Academician last week, is an Irishman by birth, but was taken to America when quite young, and has since become one of the most notable sculptors in the United States. He is at present engaged on the statue of Parnell which is to be erected at the head of Sackville Street, Dublin, the foundation-stone having been already laid.

Tenders for Liverpool Cathedral.—Good progress is being made with Liverpool Cathedral, and it is expected that the foundations will be complete by the end of next month. The Executive Committee are now making arrangements for obtaining tenders for the erection of the main fabric. The subscription fund for the cathedral now totals £250,000. The amount required for the completion of the present portion of the building is about £340,000, so that £90,000 is still required.

"Architects and the General Election."—The following is a list of architects, contractors, &c., contesting Parliamentary seats:—

	Seat.
J. E. Sears (L. and F.T.), architect, chairman of L.C.C. Housing Committee	Cheltenham.
Philip E. Pilditch (U. and Bal.), architect and surveyor, London	St. Ives.
William Hunt (T.R.), architect, London	S. Islington.
T. B. Silcock (L. and F.T.), architect, Bath	Wells.
Sir Edward Boyle (C. and Bal.), "architect and barrister"	Taunton.
Sir Weetman Pearson (L. and F.T.), head of the well-known contracting firm of S. Pearson & Son	Colchester.
Sir John Jackson (C. and Bal.), civil engineer and Government contractor	Devonport.
John Aird (C.), son of Sir John Aird, the well-known contractor	Southampton.
J. J. Glover (U.), painter and decorator, and provost of Dumfries	Dumfries.

A Lock-out in the Building Trade at Limerick is announced. Some time ago a conference took place between the masters and masons on matters affecting the trade, at which the masters urged employment at a wage hour instead of per day as heretofore. The men declined to accept this latter condition, with the result that about seventy masons were locked out last week.

Rodin's "Le Baiser" is the centre of interest at the "International" at the New Gallery. It has been lent by Mr. E. P. Warren, the well-known architect, and was brought from Lewes on a trolley. "Le Baiser" is probably the heaviest block of marble that has ever been placed in the New Gallery. The moving of it from the street to the Central Hall and the putting of it in its present position occupied eight hours.

A new Hospital at Waltham Abbey has been erected at a cost (including site) of about £10,000. The buildings comprise entrance lodge, administrative building, an isolation block with four beds, diphtheria block with eight beds, scarlet-fever block with twelve beds, and laundry and mortuary block. The joint architects were Mr. Walter Stair, of Chingford, and Mr. Herbert Tooley, of Buckhurst Hill. The contractor was Mr. J. Bentley, of Waltham Abbey.

Glasgow Technical College Architectural Craftsmen's Society.—At last Friday's meeting of this Society Prof. F. O. Bower, M.A., Sc.D., F.R.S., delivered a lecture on "Dry Rot." The nature of the fungus, its growth in dead wood under favourable atmospheric and chemical conditions, the germination of the spores (which are extremely minute and produced in vast numbers), the process of ferment and the characteristics of timber attacked by the disease were described in detail and illustrated by lantern views. The professor thereafter explained the most likely causes of growth, and precautions to be observed to ensure its prevention and elimination.

Architectural Association of Ireland.—At last week's meeting of this Association, held in Dublin, Sir Charles Cameron delivered a lecture on "The ventilation of workshops and dwellings." He stated that in order to properly purify the air used by each adult nearly 40,000 cub. ft. of fresh air per day was required. He referred to the working-out in Lancashire cotton works of the Acts regulating the ventilation of factories, and said that in some cases it was found possible to keep the proportion of carbonic acid gas down to .08. He stated that one gas (Argand) burner would vitiate the air as much as four persons, and said that this ought to be taken into account in calculating the amount of fresh air-supply necessary.

District Surveyors and the L.C.C.—The District Surveyors' Association, on behalf of the district surveyors of London, has addressed a letter to the London County Council in regard to the latter's proposals to reduce the number of districts from fifty-seven to thirty-three and to adopt a dual system of payment for district surveyors, the one by salary and the other by fees. "The district surveyors respectfully submit that the supervision of building operations has been carried out by highly-trained men—many of whom have occupied the highest positions in their profession—that the public has grown accustomed to pay professional fees for professional services, thus adequately rendered, and it is at least doubtful whether the suggested payment by salary will attract educated men of the first ability; from a professional point of view therefore the reflection suggests itself that changes in the direction indicated above may not be in the interests of the best and most efficient administration of the building laws."

A Stick of India-rubber, bound round at the middle with a band of celluloid on which is printed the advertisement of "Bitumastic" solution and enamels, is offered by Messrs. Wailes, Dove & Co., of 5, St. Nicholas Buildings, Newcastle-on-Tyne, to any architect or surveyor who is interested in "Bitumastic" and its special preservative qualities for valuable iron and steel plant or structures.

The Royal Gold Medallist.—The person whose name is to be submitted to His Majesty the King as the fit recipient of the Royal Gold Medal this year will be announced at the meeting of the Royal Institute of British Architects to be held on Monday, February 5th. Members of the Institute wishing to suggest names for consideration by the council should do so in writing before next Monday, January 22nd.

The new Town Hall at Woolwich, which has taken four years to erect, was opened on Saturday last. The building, designed in the Renaissance style, stands at the corner of Wellington and Upper Market Streets. Its façade measures 114ft. by 230ft., and a belfried tower 130ft. high surmounts the roof. In the great entrance hall is a statue of Queen Victoria. The council-chamber is designed in the form of a Greek cross, surmounted by a dome at the crossing. It provides seating accommodation for fifty-six members, and has a large public gallery. The architect of the building (which has cost £95,000) is Mr. A. Brumwell Thomas.

Correspondence.

The Painting of Uralite.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Subjoined is a copy of a letter which we have received from Mr. A. Alban H. Scott in reference to his statement that "Uralite requires constant painting," made "in the course of the paper on factory buildings which he read before the Institute of Sanitary Engineers recently, which paper was published in your issues for December 20th and 27th last.—Yours truly,
For THE BRITISH URALITE CO., LTD.,
T. H. Armstrong, Manager.

LONDON, E.C.

[Copy.]

A. Alban H. Scott, M.S.A., F.I.S.E.
S. Charles Hanson, M.I.S.E.
Percival M. Fraser, F.I.S.E.

Architects and Surveyors, 10, Basinghall Street,
Messrs. The British Uralite Co., Ltd., London, E.C.
50, Cannon Street, E.C. Jan. 5th, 1906.

Dear Sirs,—With reference to Mr. Armstrong's interview with me on the 1st January on the subject of my paper on factory buildings read before the Institute of Sanitary Engineers, I have pleasure in stating herewith the exact meaning which I intended should be put upon my statement that "Uralite requires constant painting."

I am aware the expression "constant painting" may be loosely taken to mean that painting should be applied at unusually short intervals of time, but this meaning is not justified by the word, and it was not my intention that this interpretation should be put upon this expression of my opinion.

I used the word "constant" in its strict sense, i.e., unalterable continuance, which suggests nothing further than a coat of paint should be applied periodically, the intervals being determined by the endurance of the paint used, which is, of course, governed by the quality of the paint and extraneous circumstances.

My remark particularly applied to factory roofs, for which I have largely used Uralite, and which, having view to the peculiarly severe conditions which they are subjected to, I consider should be painted regularly every three years.

The sentence above referred to should be read in conjunction with the various other references to Uralite in my paper.

As you are doubtless aware, I have used Uralite for many purposes, and am satisfied that it is an excellent material.—Yours faithfully,

(Signed) A. ALBAN H. SCOTT.

[The British Uralite Co. inform us that they can refer to roofs four and five years old which have never been painted, and so far as experts are able to judge, at the present time, they will not require painting for five years more, Uralite being a material which hardens on exposure to the weather.—Ed. B.J.]

THE STABILITY OF IRON STRUCTURES.

Sir Benjamin Baker's Evidence at the Charing Cross Enquiry.

AT the enquiry into the collapse of the roof over Charing Cross Station some interesting evidence was given by Sir Benjamin Baker last week. The roof, which was constructed of malleable iron, was designed and carried out under Sir John Hawkshaw. Messrs. Cockrane & Grove, the manufacturers, were one of the best firms in the country at the time, and the iron came from Lord Dudley's works, which was a guarantee of its quality. The width between the walls was 164ft., the length 510ft. The roof was carried by fourteen main principals 35ft. apart, and there were nine panels in each. The tie-rods consisted of wrought-iron round bars, and their diameter varied in each panel. The minimum diameter was 4 $\frac{3}{8}$ ins. and the maximum 5ins. The tie-rod broke in the third panel. It was 4 $\frac{1}{2}$ ins. in diameter. In between the principals were fixed purlin girders, rafters and glazing bars. There were signs of rust appearing on the underside of the glazing bars and on the intermediate rafters. That was the only ironwork which had rust on it. The evidence at the enquiry, however, proved that the collapse was not due to any eating away by rust, but purely to a flaw in the tie-bar—a hidden flaw not discoverable on the exterior. Sir Benjamin Baker said the tie-bars of the roof were made up of a number of flat bars welded together, and in

the Particular Bar that failed

there were eight flat bars on top of one another. Sometimes in making up a pile there would be perhaps two short bars interposed, and occasionally the ends of these short bars did not make a good metallic union, the result being a flaw in the bar quite independent of the weld.

Modern Practice.

At the present day, when steel had superseded iron, all these things would be made out of a solid ingot of steel without any weld. Forty-two years ago, when this roof was made, structural steel was not in existence, and all these structures were made of bars rolled from piles of similar bars. Steel was generally accepted in or about 1880.

A flaw would have a tendency to extend under stress, which would be a pull on the tie-rod, varying with the temperature. He had noticed

The Effect of Variation of Temperature on the Forth Bridge,

where he had seen the effect of a cloud passing over the sun. The bridge would begin to contract, and as soon as the cloud had passed away it would expand again. This in the case of the Charing Cross roof would cause a little "fidgeting," and after a lapse of forty years the flaw had snapped through. The question as to the tie-rod being painted made no more difference than it would in the case of a chain cable. There was

No Mystery about this Failure.

at all; it was a simple thing. If this tie-rod had been intact they might have loaded one of the principals with railway carriages and they would not have brought it down; they could have put one of the District trains on one of the principals without causing it to give way. But the bar was only one-third its proper strength owing to the flaw.

At this point Sir Benjamin Baker said he would like to add that 42 years ago the ideas of engineers on the subject of the strength of roofs were different to what they were now; to-day they were making them stronger.

He thought the Charing Cross roof would be about quite the strength some architects and engineers would consider necessary; yet at the present day they would make it even a little stronger, but it was

FLATS AND PREMISES, UNION STREET AND CANDOVER STREET, LONDON, W.
H. FULLER-CLARK, ARCHITECT.

quite up to the highest engineering standard when built. Witness had advised the rebuilding of the roof, his principal reason being that he did not know whether there was not another flaw there. But for the flaw the bridge would have been good for another twenty years or more.

Double Tie-rods.

The practice of the present day would not be to trust a roof like this to a single tie-rod; they would have two, so that if there was an invisible flaw in one they would have another to fall back on. The prototype of this roof was one erected at Birmingham five years before the Charing Cross one was put up, and it was still standing. It had been perfectly successful in every way, and was a much admired roof. No doubt Sir John Hawkshaw modelled the Charing Cross roof, and made it stronger. In his large experience witness had seen other roofs constructed on similar lines with a single tie-rod, and this was the first failure he had ever known.

Experience at the Menai Bridge.

Sir Benjamin Baker went on to refer to the Menai Suspension Bridge, built eighty years ago. The Government got rather alarmed about the condition of the bridge owing to some of the minor suspension rods having rusted through, and they talked about renewing the whole thing. Witness was instructed to examine and report, and he naturally thought that the anchorage chains which went into the rock would be oxidized, but on scraping off the point he found the original blue scale and marks of the blacksmith's hammer that had been in existence for fifty or sixty years, and subjected to the atmosphere, showing that an indefinite life could be given to iron. The difficulty in railway stations was the gases from the engines and being unable to get paint to stick on. There had never yet been invented a material to preserve iron and make it endure the atmosphere, &c.

Sir Benjamin Baker added that the tie-rod measured 4 $\frac{1}{2}$ ins. at the point of fracture, and it had been affected by rust to the extent of $\frac{1}{16}$ in. On close inspection he could count the eight bars of metal of which it was composed.

He should say that in forty years the roof had lost only about 6 per cent. of its strength.

A full report of the evidence at the enquiry is given in the "Times" for January 9th, from which the foregoing extracts are taken.

A NEW LONDON BUILDING.

THE building which is illustrated above consists of twenty-four flats containing entrance lobby, sitting-room, bedroom, kitchen, larder and w.c.; and four flats, with entrance hall, sitting-room, two bedrooms, kitchen, bathroom, w.c. and larder. Offices are arranged on the ground floor of the corner block, workshops in the basement beneath, and two additional workshops are provided in the rear. An endeavour has been made to obtain effect by means of colour for the exterior, which is of red Chorley, blue Staffordshire and brown salt-glazed and Luton bricks, Portland stone, green granite, buff-coloured cement, mosaic of green, buff-colour and gold, green slates, beaten lead devices, oak and copper-covered flèches and white joinery. The builder's work has been carried out by Messrs. Smith & Co., of 6, Grays Street, Manchester Square, W.; steel construction by Messrs. Drew-Bear, Perks & Co.; granite by Messrs. Fenning & Co.; sanitary work, ranges, gas, hot-water, electrical work and railings by Messrs. Thomas J. Boulting & Sons (who now occupy the offices referred to); lead glazing by Messrs. William Morris & Co.; carving by Mr. Nathaniel Hitch, of Kennington; mosaic by the Rust Vitreous Mosaic Co.; marble-work and wood-block flooring by the Art Pavements Co.; pavement lights by the St. Pancras Ironwork Co.; wallpapers by Messrs. Line & Sons; steel casements by the Crittall Manufacturing Co., of Braintree; artificial stone staircases and granolithic pavings by Messrs. F. Bradford & Co.; partitions by the Fireproof Co., of Adelphi, W.C.; ironmongery by Messrs. Lockerbie & Wilkinson; goods lift by Messrs. Waygood & Co.; folding gates by the Bostwick Gate Co. The architect was Mr. H. Fuller-Clark, of 30, John Street, Bedford Row, London, W.C.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Aesthetic Design of a Façade.

CHEETHAM.—STUDENT writes: "In what way should the aspect of a façade govern its aesthetic design?"

This question is really so vague that it is difficult to frame a reply to it. Perhaps section 1, chapter I, book III. of Gwilt's "Encyclopædia of Architecture" may be referred to for the governing principles. Two extracts may be given. "There has lately grown into use in the arts a silly pedantic term under the name of æsthetics, founded on the Greek word *αισθητικὸς*, one which means having the power of perception by means of the senses; said to be the science whereby the first principles in all the arts are derived, from the effect which certain combinations have on the mind as connected with nature and reason; it is, however, one of the metaphysical and useless additions to nomenclature in the arts, in which the German writers abound, and in its application to architecture of least value; because in that art form is from construction so limited by necessity that sentiment can scarcely be said to be further connected with the art than is necessary for keeping the subordinate parts of the same character as the greater ones under which they are combined; and, further, for thereby avoiding incongruities." The end to keep in view is summed up in the one word "fitness," and the directions to a student for testing his design in this respect are stated as follows: "Let that which is the stronger part always bear the weaker. Let solidity be always real, and not brought to appear so by artifice. Let nothing be introduced into a composition whose presence is not justified by necessity. Let unity and variety be so used as not to destroy each other. Let nothing be introduced that is not subordinate to the whole. Let symmetry and regularity so reign as to combine with order and solidity. Let the proportions be of the simplest sort. Let him recollect that nothing is beautiful which has not some good and useful end."

HENRY ADAMS.

Work carried out not according to Contract.

X. writes: "Is owner obliged to pay for inferior and unsound work contrary to agreement? Can he insist on necessary alteration to render work sound without incurring extra expense and reduction of price to correspond to inferior work, or can he reject the work entirely? Agreement signed but not stamped. Is blue pencil legal?"

Unless you have done something in the way of acceptance of the building, and have waived your right to object to the unauthorized deviations from the contract, you possess the right to require its proper fulfilment. The offer of a compromise should, I think, come from the builder's side, and should not, primarily, be made by you. The following extract from "Specification No. 6," page 141, deals with the case: "If the deviation from the terms of the contract arises from an act of the architect not within the scope of his authority . . . the building owner will not be responsible for it, and, of course, if the contractor chooses, of his own accord, to depart from his contract, the building owner is neither bound to accept the work as

executed, if the contract has not been complied with, nor to pay for any extra expense that has been incurred. The building owner may indeed elect to adopt the unauthorized deviations and accept responsibility to pay for the work as actually executed; but it is to be born in mind that the mere fact of taking and retaining possession of the work as it stands is not, by itself, evidence of adoption so as to render the building owner liable, because he cannot return a structure as he could a movable article not made according to contract, and he is not bound to undergo the expense and inconvenience of having it removed."

F. S. I.

Strength of Open Truss.

B. F. writes: "Is the truss shown by the accompanying sketch (not reproduced) strong enough without tie-rods, and are the purlins too heavy? The builder has expressed an opinion on them which does not agree with mine."

The truss does not need tie-rods; but a $2\frac{1}{2}$ in. by $\frac{3}{8}$ in. plate and an altered position of bolts and joints, as shown by the drawing below, will make it quite safe. The principal

rafter might be reduced to roins. by 5 ins. or possibly even to gins. by 5 ins. if the plate named above is added.

HENRY ADAMS.

Relation of Window Area to Floor Area.

CHEETHAM.—STUDENT writes: "What relation should the window space bear to the floor space in the following rooms:—Living-rooms and bedrooms of a residence, a public hall for lectures and entertainments, offices for business purposes, hospital, school? Please state whether your answer refers to the nett glass surface or to the clear opening between the brick or stone jambs."

There are many rules for proportioning window area to floor area, but every case must be considered on its own merits, as dependent upon the aspect and surroundings, as well as the purpose for which the rooms will be used. One-eighth of the floor area may in general be taken as a suitable proportion for the gross area of window space in the walls, or one-tenth as the nett area of glass, but the proportions of the room and position of the windows will affect the result. In the Pantheon at Rome each superficial foot of area of the eye in the dome lights nearly 3,380 cubic feet of interior space, while the ball-room at Windsor Castle, 60 ft. long, 34 ft. wide and 33 ft. high, is abundantly lighted by a single window occupying nearly the width of one end; had the same amount of window area been given in the long walls the lighting would have been very inadequate. Robert Morris gave the rule that the window area in square feet should be equal to the square root of the contents of the room in cubic feet. A room which is not lofty is more conveniently lighted by windows in one of the longer sides. In rooms for teaching, the area of window glass

must not be less than one-fifth of the floor area, and in other rooms in a school one-eighth.

HENRY ADAMS.

Architectural Societies.

BELFAST.—P. B. G. writes: "I am an architect's pupil, and will shortly finish my apprenticeship. I am very anxious to join some society. In your issue for October 18th, 1905, you published a reply to 'H. J.' with regard to the passing of examinations for the degrees of M.A. and B.A., also the Society of Arts. Is there any degree in connection with the Society of Arts? I have seen various men styled 'M.S.A.' Does this refer to the Society's degree?"

There is no architectural degree in connection with the Society of Arts. The letters "M.S.A." mean "member of the Society of Architects." This Society holds examinations for which you would be eligible. Full particulars can be obtained from the secretary at Staple Inn Buildings, Holborn, London. There is also, of course, the Royal Institute of British Architects, of which you might qualify as probationer (particulars from secretary, 9, Conduit Street, London, W.).

Modern Architectural Work.

BROMYARD.—D. G. M. writes: "In which back number of your journal can I find illustrations of work by Messrs. Woolfall & Eccles, of Liverpool?"

December 28th, 1904.

House Building in India.

STREATHAM.—J. S. M. writes: "Where could I obtain information respecting the life of house property in India (North Central), having regard to the effect of climate, insect life, &c.?"

We do not know of any book dealing with the subject. Woodwork needs protection against the ravages of ants, but apart from this there is very little difference in construction, and if proper precautions are taken the life of buildings in India is as long as in this country.

Examination Questions.

WARRINGTON.—SUBSCRIBER writes: "Kindly give the solutions to the following examination questions of the Society of Architects." (Here follow the questions.)

We have stated many times that these "Enquired Answered" are primarily intended to help readers who find difficulties in actual practice: not difficulties at examinations. While we endeavour to aid the student in every possible way, we must decline to answer purely examination questions such as those "Subscriber" sends.

Book on Hospital Design.

MARGATE.—STUDENT writes: "What book do you recommend on hospital design and construction? My funds are limited to one guinea."

"Small Hospitals," by A. Worcester and W. Atkinson (price 5s. 6d. post free from our offices).

Widening Princes Street, Edinburgh.—

The question of widening Edinburgh's notable thoroughfare—Princes Street—was considered recently by a sub-committee of the Town Council. The proposal is to take in part of the Princes Street Gardens in order to erect a promenade on the street level, making it, together with the existing pavement, about 25 ft. wide. The present sloping bank from the street to the pathway in the gardens would be filled up, and a retaining wall about 18 ft. high built, with a stone parapet. The sub-committee remitted to the city architect (Mr. Morham) to take borings, with a view to finding suitable foundations and to obtain an estimate of the cost.

NOTES ON COMPETITIONS.

Hove Library.

The new conditions have been issued to the ten competitors who were selected to submit fresh designs for the proposed free library at Hove. They are in most respects the same as the old ones, except that the first clause announces the appointment of Mr. John Belcher, A.R.A., to act as assessor, and a requirement has been added for a side entrance to give access to the space at the rear of the building. The harassing condition that the building was to accord in elevation with the town hall has been removed. Whatever admiration one may possess for the works of the late Mr. Alfred Waterhouse, one could not but feel that the requirement that this building should be imitated was most inadvisable. It might be imagined that the ten selected competitors did at least comply with this condition as well as with all the others, for the premiums of £50, £30 and £20 are now to fall as prizes to them alone. This is not the case, however, for it is known that more than one out of the chosen few ignored this requirement altogether. The modifications in the conditions, although few, are sufficient to constitute the competition an absolutely new one—that is to say, the original designs are of little use, for it is unlikely that many of them will admit of the introduction of a side passage without entailing a rearrangement of the plan. These circumstances only add to the regret felt that the premiums were not awarded in the original competition, and that other means were not found to induce a selected few to compete. The promoters through their assessor have, by the revision of the conditions, admitted the imperfections of them as originally issued, and, such being the case, the sixty-one rejected competitors have solid grounds for complaint. The advisability of a double competition is at all times open to doubt, but when announced as such competitors have at least the knowledge of what they are to expect. In this case a double competition has been sprung upon them without warning, and in addition to sixty-one designs being summarily rejected, the authors of ten others have to do double work before they are able to obtain even a premium.

Greenwich Branch Library.

It is a surprise to learn that the designs submitted many weeks ago for the Greenwich Branch Library have not yet been assessed. When the deposits for conditions were returned to competitors it was reasonably inferred by them that the awards had been made, although indignation was felt that no announcement to that effect accompanied the cheque. To have obtained the addresses of depositors it must have been necessary to open the envelopes which contained the competitors' reports upon their respective designs. The assessor is thus in the position of having to adjudge works of which all the authors' names are known to the promoters. Thus the very object for which designs were sent in, unsigned, and free from *non de plume* or motto, has been defeated. The promoters or their officials are guilty of an unprecedented and unfair act. It is only the confidence felt in the assessor which enables the proceeding to be viewed with composure.

Norwich Shirehouse.

In May last the Competition Reform Society disapproved of a competition for the extension of the shirehouse at Norwich upon the grounds that it was an unreasonable requirement that a tender from a reliable contractor should accompany the design of each competitor, such a course involving the preparation of bills of quantities, for by no

other means could a contractor's estimate be relied upon. Likewise no site plan or plans of existing buildings were furnished. The result of this competition has lately been announced. The author of the first-premiated design estimates the cost of the building at £8,850, and the author of the design placed third estimates his at £9,500, while the assessor puts the costs respectively at £13,820 and £13,400. It would be interesting to know whether these designs were considered to have complied with the conditions; also who were the reliable contractors who prepared the estimates. No doubt they would have been quite willing to carry out the work for the sums named, and had the assessor been wise he might have earned praise from Norwich ratepayers by abstaining from a mention of larger sums. The author of the second-premiated design estimates his building at £13,210, against the assessor's £13,640; he is Mr. William Widdington, of Cheapside, E.C. The first premium belongs to Mr. E. J. Tench, of Norwich and Cambridge, and the third to Mr. W. J. Dunham, also of Norwich. The assessor was Mr. A. J. Wood, of Surrey Street, W.C.

Holborn Borough Offices.

A proposal to invite six architects to compete for the new offices to be erected for the Holborn Borough Council, at an honorarium of twenty guineas each, came up for consideration last week, but was referred back. If the Council wished to limit the competition in any way, it might have confined it to architects practising in the borough who are ratepayers. This would seem a more reasonable course, especially as the proposed building is a public one and is to be erected at public cost. Holborn is rich in architects, and the adoption of such a course should have been productive of a building worthy of the borough.

Slaughter-houses for Edinburgh.

At a recent meeting of a committee of the Edinburgh Town Council the proposal to hold an open competition for the new slaughter-houses to be erected in the city was considered. A sub-committee reported in favour of the proposal, but by 9 votes to 6 the full committee decided against it, holding that the special requirements of the building were rather those of convenient planning than architectural effect, and this work could be done just as well in the office of the city architect (Mr. R. Morham) as by outside men.

Pleasley Library.

The assessor appointed in the competition for a new Carnegie library at Pleasley, Notts, is Mr. Ernest R. Sutton, F.R.I.B.A., of Nottingham. The conditions will be issued soon.

Obituary.

Mr. Henry John Young, junr., eldest son of Mr. H. Young, of Messrs. H. Young & Co., Nine Elms, with whom he served his apprenticeship, and on whose staff he was occupied in the design and execution of constructional engineering work, died recently, aged 36. At the time of his death he was engaged as consulting engineer for the new Piccadilly Hotel, now in progress, and a distinguished professional career seemed to lie before him. He leaves a widow and three children. Being a past-chairman of the Junior Institution of Engineers, a number of the members were present at the funeral, bearing testimony to the esteem in which he was held. To perpetuate his memory a fund has been opened with the object of placing a bronze medallion portrait in the reading-room of the Institution.

MECHANICAL VENTILATION.

By Dr. H. Scurfield.

AT the last meeting of the Sheffield Society of Architects and Surveyors Dr. H. Scurfield, medical officer of health for Sheffield, delivered a lecture on "The Advantages and Disadvantages of Mechanical Ventilation." He stated that air ordinarily contained about 4 parts per 10,000 of carbonic acid, and it had been found that when the air of a room contained as much as 6 parts per 10,000 of carbonic acid it began to smell. An average person gave off 6 cub. ft. of carbonic acid per hour; and would therefore load 1,000 cub. ft. of air to the extent of 6 parts per 10,000 in an hour and 3,000 cub. ft. to the extent of 2 parts per 10,000. As 4 parts per 10,000 was the amount normally present in the atmosphere, and 6 parts per 10,000 was the limit of good ventilation, it followed that 3,000 cub. ft. of fresh air per hour must be supplied for each occupant in order to maintain the ventilation of a room efficiently.*

If each individual has a cubic space of 1,000 cub. ft. the air must be changed three times in the hour; if 150ft. only the air must be changed twenty times in the hour. It was generally agreed that in this country during the colder months a change of air more frequently than about three times in the hour could not be borne unless the incoming air were warmed.

Mechanical ventilation had been introduced on account of the difficulty of changing the air of a building sufficiently often to maintain good ventilation without intolerable draughts, by ordinary means, such as open fires, and the provision of inlet and outlet shafts and openings through which the air is moved by differences in temperature, the aspirating action of the wind, and the law of the diffusion of gases. Extraction fans also answered satisfactorily for single rooms, such as restaurants, hotel dining-rooms, &c.

Where the cubic space allowance was small, as in our elementary schools with 120 to 150 cub. ft., mechanical ventilation was the only system which was capable of giving really good results as regards the purity of the air, but where the cubic space allowance was large, as in hospitals, with 2,000 cub. ft., its introduction was probably undesirable.

In the second place he thought that if mechanical ventilation was decided upon for a building, the fact ought to be realized that by its means the air of the building could be changed at least twice as frequently as by other methods, and that its introduction was equivalent to doubling the cubic space of the building, and that it was therefore well worth while to pay for as perfect an installation as could be obtained.

In the third place the contract as to what air changes were to be accomplished by the method should be carefully drawn, and after the work was completed careful tests by chemical analysis of the air and the anemometer should be made in order to ascertain that the terms of the contract had been fulfilled.

In the fourth place the person responsible for the management of the building should thoroughly understand what were the capabilities of the system, so that it might not be expected to perform impossibilities. For example, mechanical ventilation would keep the air in the class-rooms of an elementary school good for a matter of eighty minutes, but if the class-rooms were not emptied and filled with fresh air at the breaks, the air in them would be just as bad at the end of the morning or afternoon school as the air in the class-rooms of a naturally ventilated school just before the break.

* We have dealt critically with this in a review on p. 39 of this issue.—Ed. B.J.

Views and Reviews.

The Newsagents' Diary.

The Newsagents', Booksellers' and Stationers' Diary for 1906 should be in the hands of every member of the trade. In fact it is well-nigh indispensable. Beside the usual space for daily entries, there are a number of valuable trade tables, a newsagents' delivery book, standing order books for daily, weekly and monthly publications, and space to record returns.

"The Newsagents', Booksellers' and Stationers' Diary for 1906." Glasgow: William Holmes & Co., Ltd., price 2s. 6d.

By-Laws in regard to Floors and Roofs.

This little book has been compiled with the object of explaining the Model By-laws for the construction of roofs and floors in new buildings, issued by the Local Government Board. The official regulations require quite excessive sizes for joists, rafters, purlins and trimmer joists, as Mr. Essex shows by a series of comparative tables indicating the distances between supports with the approximate size to give safe strength, as calculated from the formula he adopts, compared with the sizes required by the Model By-laws. The formula he uses is

$$w^{12} = bd^2.$$

He assumes w with a load of $\frac{1}{2}$ cwt. per sq. ft. super. on the roof to equal $\frac{5}{8}$ cwt. in the case of common rafters 15 ins. apart and $\frac{1}{4}$ cwt., $\frac{1}{8}$ cwt. or $\frac{3}{8}$ cwt. for purlins where placed respectively 6ft., 7ft. 6ins. or 9ft. apart. In the case of floor joists 15ins. apart with a load of 1 cwt. per ft. super., he assumes $w = \frac{1}{10}$ cwt. for domestic buildings, whereas for warehouses with a load of $2\frac{1}{2}$ cwt. per ft. super. $w = \frac{1}{4}$ cwt. In the case of floor beams placed 10ft. apart $w = \frac{5}{8}$ cwt. in domestic buildings and $2\frac{1}{2}$ cwt. in warehouse buildings. For trimmer joists Mr. Essex uses the formula

$$B D^2 = bd^2 + (\frac{1}{3}bd^2 \text{ for each joist carried}).$$

It will be apparent that these assumptions are fairly reasonable, and we may hope will be conclusive enough to lead the Local Government Board to revise their Model code, but we do not see why the by-laws need specify minimum sizes. This has been the bugbear of the building trades far too long. What we want is by-laws indicating the theoretical rules to be used in the calculation of structural members and the loads which shall be assumed in various classes of buildings, and the allowable safe fibre stress to be adopted. As regards this last, Mr. Essex adopts the factor of safety of 5 and assumes that good fir timber has a breaking strength of 60 cwts. per sq. inch. As of course other timber may be used in special circumstances, the opportunity of variation in this direction should be given. A very useful table at the end of the book compares the values of the different sections of iron and steel beams with those for fir beams.

"Roofs and Floors of New Buildings: Their Structure and Stability," by Ernest H. Essex. London: The St. Bride's Press, Ltd., price 2s. 6d.

Mechanics.

Of the making of books on mechanics there seems no end, but this latest one by Mr. Mansfield Merriman, the well-known author of engineering works, is certainly a very good one for the student of engineering and building construction. Dealing as it does with the fundamental principles, it does not carry us very far, but it will undoubtedly be found to be very useful as constant appeals are made to experience, by which alone the laws of mechanics can be established. Numerous illustrations are given and many queries and problems stated as exercises. The student is not required to possess advanced mathematical knowledge, only being asked to have a knowledge of plane

geometry, elementary algebra and plane trigonometry.

"Elements of Mechanics," by Mansfield Merriman. London: Chapman & Hall, Ltd., price 4s. 6d.

Duties of a Clerk of Works.

This useful little book by the late John Leaning, now in its second edition, has been enlarged somewhat by the addition of some items, the instructions to clerks of works by the late School Board for London, synopsis of the regulations adopted by various other public bodies, and the rules for the examination of the Incorporated Clerks of Works Association of Great Britain. The book is undoubtedly the handiest work on the subject, and should be in the possession of every clerk of works.

"The Conduct of Building Work and the Duties of a Clerk of Works," by J. Leaning, F.S.I. London: B. T. Batsford, price 2s. 6d. nett.

Brickwork.

There are many books which deal with the craft of brickwork, and this book, although intended to serve for the practical bricklayer, gives very little beyond what is to be found in good works on building construction. The information on bonding is very clearly given with serviceable illustrations, while special kinds of work, such as hollow walls, chimneys and fireplaces, are also dealt with. All this may be passed over, as it has already been done many times before. In the latter part of the book, dealing with the setting-out and cutting of bricks for gauged work, arches and niches, domes and oriel windows, the information is sufficiently good to enable us to recommend the work for purchase by students. The price is small and the book is well got up.

"Practical Brickwork," by Paul N. Hasluck. London: Cassell & Co., Ltd., price 2s.

Electrical Engineering.

Handbooks on the subject of electrical engineering are not numerous, and therefore this serves a very useful purpose. It is, of course, only intended for elementary students, but it goes a good way, and will serve as an introduction to more advanced works on specialized branches of the subject, of which there are many published.

"Electrical Engineering," by T. Sewell. London: Crosby, Lockwood & Son, price 7s. 6d. nett.

Gilding, Bronzing and Lacquering.

This is a very useful addition to the "Decorator" series of practical handbooks, edited by Mr. A. S. Jennings. The subject of gilding, bronzing and lacquering have been to a great extent overlooked in works on the practical side of decorating and painting, though, considering how often these come into work of this description, it is surprising that it should be so. The omission is well repaired in this book, which is thoroughly practical and contains a large amount of information. The illustrations are clear and to the point.

"Practical Gilding, Bronzing and Lacquering," by F. Scott-Mitchell. London: The Trade Papers Publishing Co., Ltd., price 3s.

A Phase of Moslem Architecture.

There are many important and interesting remains of architecture existing which have never been investigated and recorded in any way. We are therefore always glad to welcome any original investigation that places on record for reference by architectural historians buildings fast falling into decay. There are very few official scientific investigations in any direction, but the Danish Government is one of the foremost in this respect, and it is noteworthy that several volumes have been published by Danish authors, not in their national tongue but in English, apparently because the latter language is more widely known. Lieut. Olufsen, of the first and second Pamir expeditions in 1896-99, had an opportunity of investigating the architecture of Transcaspia, Khiva,

Bokhara and Turkestan, and he has recorded in this work some of the early Moslem buildings which are falling into ruin. A large number of photographs are provided, which show that these buildings belong to the best period of Turkish architecture, the decoration being extremely rich yet delicate. The country now belongs to Russia, and until its conquest was practically inaccessible. Lieut. Olufsen suggests that probably it would be possible to obtain from excavations in the oases some knowledge of the architecture and culture of the pre-Islamic age in Central Asia, namely, the Avesta age, about the time of the dynasties of the Parthians and of the Sassanids. It is to be hoped that we may have this investigation in the near future. The glazed-tile work is the most important portion of these buildings, and will repay study.

"Old and New Architecture in Khiva; Bokhara and Turkestan," by O. Olufsen. London: Thomas Tofts, 17, Old Queen Street, S.W., price 15s.

Hygiene.

The admirable way in which this work was originally compiled (it has since been extended and revised) led to its considerable success, the fact of which is proved by this present sixth edition. Hygiene embraces so many subjects that it is not surprising most authors have been somewhat at sea in dealing with sanitation and ventilation and other specialized branches of the subject. In this respect the book now under review is still somewhat old-fashioned and inadequate. The long familiar discussion on the chemical composition of air is gone through, winding up with descriptions of early forms of natural ventilation. The fact that a textbook should still support the old ideas is regrettable, because the authors of works on hygiene have had far too much to say up to the present in the drawing-up of by-laws as to the cubical space to be given in dwellings, schools, asylums and other buildings. De Chaumont's old standard of 3,000 cub. ft. of air per hour per person is still advocated, although the authors do think that such a standard is possible to obtain, while they also state that a change of air three times an hour is all that can be obtained. From this reasoning they advocate 1,000 cub. ft. per person. This is based upon the assumption that 1,000 cub. ft. of air should not contain more than '6 cub. ft. of carbon-dioxide. When we examine this statement, however, we see that this amount of adulteration of pure air is only the point at which the impurity can be detected by the sense of smell by anyone coming fresh from the open air. As, however, an occupant of a room quickly becomes oblivious to this, and as anything below 10 parts of carbon-dioxide appears to produce no immediate effect on health, it is clear that the proportion of '6 can be very considerably increased without any danger. The following scale has been proposed for increasing the quantity of carbon-dioxide, namely, '8, rather close; 1, close; 1'2, very close. Carnelly, Haldane and Anderson, however, give a much better way of judging the allowable quantity of carbon-dioxide in rooms. They judge by the number of micro-organisms, and they place the standard at 1 for dwellings and 1'3 for schools. This would mean that a person only required 1,000 cub. ft. of air per hour, and it would appear from this that no harm would arise. As by the natural system air can be comfortably changed four times an hour without draughts we need only provide 250 cub. ft. of air-space per person. If, however, a mechanical system of ventilation were adopted this could even be still further reduced. This shows that any regulation as regards the size of rooms in dwelling-houses is not needed because the amount of floor area and height of rooms that must be provided will always ensure a sufficiency of air space.

Overcrowding of rooms should be regulated against. This point is most important in regard to small dwellings, because the by-laws are against the construction of small rooms, and so materially increase the cost of building—so much so as almost to prevent the erection of a cottage costing £100, which is the only thing which will solve the housing problem as regards the very poor. In large buildings, however, where mechanical ventilation is adopted, it is apparent that much greater latitude should be given. There are many points in this book which are open to question in regard to sanitation, and in such subjects as the selection of building sites, the construction of walls, roofs, floors, &c. For instance, the height of rooms, the authors think, should not be less than 9ft. and rarely need exceed 12ft. Such a statement needs no comment. The book, however, on the whole is one of the best works on the subject, but we recommend that any future edition be revised by an architect and sanitary engineer.

"Hygiene," by J. Lane Nutter, M.A., M.D., and R. H. Firth. London: Longmans, Green & Co., price 4s. 6d.

A Building Note-book.

Building construction is now a recognized subject in almost all technical schools, where it is taught mostly by blackboard demonstration and the reading of elementary books, most of which are not particularly well written. This of course is well enough in its way, but students would do better if, for instance, in studying brickwork, masonry and joinery they were given practical demonstration and allowed to try their hands also. They should also be constantly making sketches and careful scale drawings of every detail of construction, and in this latter respect this series of diagrams, interleaved with squared paper, is extremely useful. This only deals with brickwork and masonry, but the system might be extended. The diagrams would have been better if reproduced larger and more space so given for careful drawing on the squared paper. However, we can only welcome this class note-book, which, we feel sure, will be of considerable assistance in the teaching of the subject.

"Building Construction: Class Note-book with Diagrams," No. 1, by A. Buchanan. London: Battersea Polytechnic.

Somerset House.

Although this book is more particularly concerned with the history of Somerset House and records many notable events and curious anecdotes connected with the former palace of the Duke of Somerset and with the present building, it is, nevertheless, of considerable value from an architectural standpoint. Not only do the authors give a very clear account of the erection of the existing building, explaining many points in the plan, but they also give numerous illustrations by which we can gather the character of the former buildings on this site, and they collect much information regarding its architectural history. Apparently, whom Somerset employed to design and erect his new palace must for ever remain in doubt. Many attempts have been made to fix the architect's identity. The clerk of works, it has been ascertained, was named Robert Lawes. Among those living in touch with Somerset who might have been the architect, the two most likely are John Thorpe and Sir John Thynne. The accepted period of Thorpe's activity, 1570 to 1610, is, however, too late to support his claim. The chief evidence of his work is found in the folio of his drawings in the Soane Museum, among which is a ground plan and elevation of Somerset House towards the Strand. Tradition has constantly favoured an individual called John of Padua as the architect. This name is here and there encountered, but not in association with a particular design. As far

as can be discovered he lived in England between 1542 and 1549 and was the recipient of two royal grants, one in 1544 and the second in 1549. John Thorpe has been confused with him, and efforts have also been made to identify this individual with Sir John Thynne. Whether he was one or the other, or an entirely different personage, has not been determined. Even John Caius, the founder of Gonville and Caius College, who is reputed to be the architect of that building, was confused with John of Padua, but a manuscript in the Gough collection stated that there was in the Combination Room at Caius College "a portrait of John of Padua, who built the college and Somerset House, on the old front of which next the Strand were some Doric columns like those at Caius College." Sir John Thynne was the steward of the Duke of Somerset, and during 1548 and 1549, according to papers preserved at Longleat, carried on negotiations for the building of a new mansion for the Protector at Bedwyn Brail End in Wiltshire. The chief reason for counting Thynne a possible architect of Somerset House is that apart from his close interest in the Duke's affairs he is known to have been a capable designer, evidence of which is given by his own mansion, Longleat, in Wiltshire, built during the years 1567 and 1579, which was more probably designed by Thynne himself than by John Thorpe or John of Padua. As he was a most careful steward, his supervision of such an important project as Somerset House must have been of the closest, and there is great probability that he was the architect. The old palace was a typical example of Elizabethan Renaissance work, and its history is carefully traced out up to the time when alterations were carried out by Henrietta Maria, who had been given Somerset House as a residence. Inigo Jones made the designs for these alterations, and he seems to have had to prepare several sketch plans before one was accepted, in much the same way as modern architects find difficulty with their clients. He had prepared a design to rebuild the whole of the river front, but this was not carried out. Eventually the palace fell into decay, and arrangements were made for its rebuilding. Sir William Chambers was appointed architect on December 25th, 1775, and the first stone of the present building was laid in 1776. Sir William Chambers, it may be mentioned, was born at Stockholm

in 1726. He began life as a supercargo in the service of the Swedish East India Co., and so visited China, where he made a study of Chinese architecture and costume, the result of which we know. When 18, after only two years in such service, he resolved to devote himself to architecture, and made a prolonged study in Italy of the buildings and writings of Palladio, Michelangelo, Vignola, Scamozzi, Sangallo, Bernini and other Italian masters. His first commission was given by Augusta, Princess Dowager of Wales, for work in connection with her villa at Kew, of which the Chinese pagoda and small Roman temples in Kew Gardens remain. In a report to the House of Commons Sir William Chambers gives some particulars of Somerset House. The Strand front is 135ft. wide, 61ft. deep, with two wings each 46ft. wide and 42ft. in depth. It is faced with Portland stone, backed with hard greystock bricks, and the timber used was Russian. The quadrangle is 210ft. wide and 296ft. deep. It is surrounded with buildings 54ft. deep. The river front is 600ft long. The foundations are of brick, a great part of them laid in the bed of the river, special precautions having been taken for stability, while others are sunk through loose-made ground 10, 12 and even 16ft. In addition to these extensive works there was a granite basement 13ft. 7ins. high, with a range of arched stone galleries and apartments thereon, raised in parts 18ft. high and others to 28ft., all on foundations built into the river, 438ft. long by 46ft. wide. Although Chambers estimated the building not to exceed £250,000, its probable cost was about £500,000, and this without King's College and the Inland Revenue Offices in Lancaster Place. The appearance of the river front has of course been much altered by the construction of Waterloo Bridge and the Victoria Embankment. We publish an engraving showing the building before these were constructed. It was not till 1830, more than thirty years after Chambers's death, that the design was fulfilled by the building of King's College. The building to Lancaster Place was erected by Sir James Pennethorne, surveyor and architect to the Government. He was born at Worcester in 1801, and came to London in 1820 as a pupil of John Nash, afterwards studying Gothic from 1822 to 1824 in Augustus Pugin's office, and then visiting France, Italy and Sicily, returning to London to carry out many important

SOMERSET HOUSE: RIVER FRONT FROM EAST (1806), SHOWING SITE OF KING'S COLLEGE.

buildings. He died in 1871. His new wing to Somerset House was begun in 1851. It is 350ft. long, and it did not need to wait for later generations to appreciate it as a fine design, for we find a letter of congratulation addressed to the architect by seventy-five fellow-architects dated July 1st, 1856. Among the signatories to it are Phillip Hardwick, C. R. Cockerell, Charles Barry, Decimus Burton and Sydney Smirke. This letter was as follows: "Dear Sir,—Your professional brethren are anxious to congratulate you on the successful completion of your design for the western wing of Somerset House, in which at the time you have adhered to the taste and style of the original edifice, and have done full justice to the genius of Chambers, you have adapted these additions to a difficult site with great propriety, and thereby produced a striking architectural feature in the entrance to London by Waterloo Bridge." King's College, which completed Sir William Chambers's conception, was designed by Robert Smirke, and has a frontage of 304ft. towards the west, with a depth of 120ft. in the central section. These are only a few of the particulars which are given in this admirable book. The many notable personages connected with the old and modern Somerset House, the history of the Royal Academy, which once held its exhibitions and schools there, with the other bodies now located in Burlington House, render this book most interesting reading. The authors have performed their task well, while the publisher has not stinted the illustrations and general production of the book.

"Somerset House Past and Present," by Raymond Needham and Alexander Webster. London: T. Fisher Unwin, price 21s.

R.I.B.A. PRIZES AND STUDENTSHIPS.

THE following have been received for the prizes and studentships of the Royal Institute of British Architects:—

Essay Silver Medal and 25 Guineas, for the biography of a British architect (deceased) practising in the nineteenth century: Six essays.

Measured Drawings, Silver Medal and 10 Guineas—Fifteen sets of drawings.

Soane Medallion and £100—subject, The realization of the ideal mansion described in Bacon's essay "On Building": Ten designs.

Owen Jones Studentship (£100): Five sets of drawings.

Pugin Studentship (Silver Medal and £40): Twelve sets of drawings.

Godwin Bursary (Silver Medal and £65): Five sets of drawings.

Tite Prize (£30)—subject, An open-air swimming bath with an arcaded or colonnaded enclosure: Twenty-one designs.

Arthur Cates Prize (£42): One entry.

Grissell Gold Medal and 10 Guineas—subject, A stone skew bridge: Six designs.

The deed of award of the prizes and studentships will be made known at the meeting of the Institute to be held on Monday next, January 22nd.

The annual exhibition will be held as usual in the gallery of the Alpine Club (entrance in Mill Street, Conduit Street, W.) from January 23rd to February 3rd, from 10 to 8.

The Second Annual Smoker of the A.A. Students will be held on Friday, February 2nd, at the Gaiety Restaurant, commencing at 8 p.m. Tickets, price 2s. 6d. each, can be obtained from the offices of the Architectural Association at 18, Tufton Street, Westminster. The number is limited to 400. Any surplus of funds will be given to the Architects' Benevolent Society and for the foundation of an A.A. musical and dramatic society.

HOT-WATER SUPPLY BY INDIRECT HEATING.*

By George Chasser.

THE ordinary system of heating water for domestic supply from a range boiler or from an independent one is undoubtedly the most direct method of transmitting the heat from the fire to the water. But although this may be an advantage, there are certain conditions in which the direct method is not the best for the purpose. The conditions referred to are where incrustation is caused by excessive deposit from the water.

This difficulty is not common to all installations, but principally in those where the water contains a considerable quantity of solid matter, i.e., in "hard water." The defects due to this cause are that the boiler and portions of the mains and service pipes become partially, and in extreme cases wholly, stopped up by the incrustation that is precipitated from the water.

"Hard" Waters.

Some hard waters when heated precipitate the solid matter, and the water becomes soft. The cause of this "temporary hardness," as it is called, is said to be due to carbonates of lime (chalk) and other salts which are precipitated when the water reaches a temperature varying from 176 to 248 degs. Fahr.

Other "hard" waters do not become soft upon boiling. This "permanent hardness," as it is called, is said to be due to the sulphates of lime (gypsum or plaster-of-Paris) and other salts that are held in solution not becoming precipitated at the boiling temperature. These salts are said to be precipitated at a temperature varying from 284 to 302 degs. Fahr., but as these temperatures are not usual in low-pressure heating we need not consider them. Water of this class would not cause much trouble in direct heating, and it is probably due to this fact that a water known to be very hard is used in an apparatus that is often boiling, yet no difficulties are experienced with incrustation.

The hardness of the water is usually brought forcibly to the notice of the household by the frequency with which the boiler and pipes have to be cleaned or replaced.

Quantity of Water a Factor in the Question.

The quantity of water passed through the boiler has an important bearing on the question. We will suppose that a house uses an average of 60 gallons of water that has boiled per day, and that the water contains a temporary hardness of 30 grains of solid matter in solution in 70,000 grains (for 1 gallon) of water; $60 \times 30 = 1,800 \times 7$ days = 12,600 grains, or 18 lbs. of sediment deposited per week. In such conditions it will readily be seen that the incrustation would soon cause trouble, and although every facility is arranged for cleaning, the time comes when a fracture occurs or stopped-up pipes have to be replaced, because it is an impossibility to ensure that every part shall be free from deposit.

Heating Surface of Boiler.

The effective heating surface of the boiler has a considerable bearing on the amount of sediment deposited. This is especially the case where the boiler is too large for the quantity of water that is required. In such cases the fire is not regulated as it should be, and the water is continually boiling in the system. If it were possible to keep the average temperature of the water at all times about 160 degs. Fahr. and to provide for more storage, a good many of the incrustation difficulties would disappear.

* Extracts from a competition paper in connection with the Institution of Heating and Ventilating Engineers (Incorporated).

Boiling Water at the Taps

is not necessary, in fact, should be avoided where it has to be used in baths, lavatories or any other earthenware or fireclay vessels. Many baths and lavatory basins have been fractured by turning on very hot water from the taps.

In sculleries hotter water may be necessary, in which case arrangements should be made to draw the water from a point as near as possible to the boiler. It may be thought that it is all a question of management of the apparatus; this may be so, but with some water, and the usual scullery maid, it is impossible to prevent the incrustation difficulties. It is to make the apparatus less dependent upon the attendant, so far as incrustation is concerned, that the indirect system is recommended. Its

Principal Advantages

are—

(1) A practical remedy for incrustation difficulties.

(2) The water in the boiler and primary heater is not changed but is heated over and over again; therefore the boiler keeps free from deposit.

(3) Boilers with extra large waterways or waterway bottoms are not necessary. Mud-lids or cleaning-out plugs are not absolutely necessary.

(4) The risks of fractured boilers or explosions are reduced to a minimum.

(5) There is no waste of fuel due to the non-conducting nature of the deposit.

(6) The cost for renewals or overhauling is small.

Working of the System.

The system of indirect heating I propose to describe is the one in which hot water is the heating medium. The water that does the heating is never changed, excepting the little that is lost by evaporation, and is confined to the boiler and primary heater. The latter is placed inside another cylinder (for

INDIRECT HEATING CYLINDERS, SHOWING PRIMARY AND SECONDARY PARTS.

preference), called the secondary one, which contains the water for the draw-off service. This secondary cylinder is analogous to the ordinary circulating one of the direct system, and contains the heated storage water. The water in the secondary cylinder receives its heat by transmission from the heated water in the primary heater (see Fig. 1, preceding page).

Good Results

are obtained by enclosing the primary cylinder, which contains the hottest water, within the secondary one, because the primary cylinder has the whole of its heat enclosed to give to the secondary water on the outside, whereas if the primary heat were on the outside greater losses by radiation would take place because of the higher temperature. The primary cylinder being fixed within the other, as recommended, affords greater facilities for connecting up the flow and return to both cylinders.

Determining Proportion of Heating Surface.

To arrive at the proportion of heating surface in the primary cylinder to take up the heat from the boiler requires some investigation.

It may be taken that the heat passed through the primary cylinder surface in a given time is simply proportional to the difference in temperature between the secondary heated water and the primary heated water.

We will first consider the transmission in heat-units per hour through the boiler-heating surface, and we may assume that it is equal to the number of square feet of surface it could supply in an ordinary radiating system multiplied by the number of heat-units emitted per square foot of that radiating surface.

An Example.

As an illustration we will assume that with an ordinary hot-water boiler each square foot of fire surface will heat 30 sq. ft. of radiating surface, and that the average temperature of the water is 170 degs. Fahr.

Taking the radiating surface to emit 18 units per square foot per degree difference between the temperature of the room, say 60 degs., and the water 170 degs., $170 - 60 = 110 \times 18 = 198$ heat-units emitted per square foot of the radiator per hour. Then $30 \times 198 = 5,940$ heat-units transmitted per hour through 1 ft. of fire-heated surface in the boiler. This quantity represents the maximum for large boilers with a good body of fire, but with small boilers of, say, 3 to 12 sq. ft. (such as would be used for domestic supply) 5,500 heat-units is nearer the quantity transmitted; also, this amount being based upon the heat given off from the radiating surface, the heat-units required to raise the metal itself to the temperature of the water are not considered.

When heating the water in the secondary cylinder by the heat that is transmitted through the primary cylinder surface it cannot be expected that the same heat-units will be transmitted per square foot as in the fire-heated surface. In the latter case the radiant heat from the fire is impinging against the surface, whilst in the primary water heated surface the maximum temperature is about 212 degs. Fahr., so that it will be seen that much more heating surface is required in the primary heater to transmit the heat-units than is the case with the boiler surface.

A Comparison between Direct and Indirect Heating.

To heat 10 gallons per hour by direct heating would take 2 sq. ft. of fire surface, while an additional $1\frac{1}{2}$ sq. ft. in the indirect method is necessary to heat the primary cylinder water. As the latter is never drawn off for supply, this represents the proportion of stored-up heat-units that has to be provided for, the compensation for which is freedom from incrustation troubles and expenses.

Of course the extra cost of the indirect cylinder feed cistern and connecting pipes over an ordinary plain cylinder has to be taken into consideration, but this will be amply repaid by the saving in cost of renewals.

Arrangement of System.

The cylinder should be as near as possible to the boiler, and the latter should be an independent one for preference, because of the greater facility for banking up and giving the minimum amount of trouble and inconvenience. Any good pattern of independent boiler in wrought or cast-iron is suitable. In small installations a boiler with an extended fuel magazine and small heating surface should be used.

The flow and return mains should be large so as to carry the heated water from the boiler into the primary cylinder in good volume, and to assist the little head pressure of the primary feed cistern. The latter should be fixed about 2 ft. above the indirect cylinder, so as to keep the head pressure as low as possible in the primary heater. This will prevent a higher temperature boiling-point due to the head of water (a head of 5 lbs., or about 12 ft., increases the temperature of the boiling-point to 225 degs. Fahr.) and assist in keeping the water in the secondary cylinder at a maximum of 180 degs. Fahr., and so reduce the risks of deposit from the worst possible water.

Care should be taken that the key to the emptying tap in the boiler is removed, because on no account should it be used for hot-water supply purposes, but only for emptying the system when required.

For large indirect cylinders, which may be fixed vertically or horizontally, the primary portion could be in two or more cylinders, or a number of lap-welded tubes of large size.

An ordinary tubular coil for the primary surface does not give satisfactory results. The water contained appears to be too little for the surface, and steam is easily made. For small indirect cylinders radiator sections, if of large waterway, may be fixed as primary

surface inside an ordinary galvanized cylinder or rectangular tank.

Sizes of Boiler and Primary Heater.

To illustrate how the sizes of the boiler and primary heater may be obtained we will assume that the apparatus has to heat 65 gallons of water from 45 to 160 degs. Fahr. in two hours.

65 gallons = 650 lbs. in secondary cylinder.
36 per cent. of 650 lbs. = 234 lbs. in primary cylinder.
14 per cent. of 650 lbs. = 91 lbs. in boiler and mains.
Total 975 lbs.

Of this quantity 650 lbs. in the secondary cylinder have to be raised 115 degs. Then $650 \times 115 = 74,750$ heat-units required. The remaining 325 lbs. in the primary cylinder and boiler have to be raised 160 degs. Then $325 \times 160 = 52,000$ heat-units, making a total of $126,750 \div 5,500 = 23$ sq. ft. required in the boiler to heat in one hour. But as we wish to do the work in two hours, then $11\frac{1}{2}$ sq. ft. is required in the boiler, and according to test $11\frac{1}{2} \times 3 = 34\frac{1}{2}$ sq. ft. required in the primary cylinder surface.

A suitable heater would be 45 ins. long overall by 27 ins. diameter, the primary surface consisting of nine 4 in. lap-welded tubes expanded into the ends. The primary water in the tubes and ends would be about 240 lbs., and the secondary heated water around the indirect surface would be about 650 lbs. The suggested arrangement is shown by Fig. 2.

The indirect system affords the convenience of being able to heat one or two radiators off the primary circuit without the disadvantages of the direct system where the radiators are heated with the draw-off water and are subject to fluctuations in temperature and air difficulties.

Where this is done additional heating power should be provided in the boiler, unless the draw-off requirements are such that the maximum quantity per hour is very intermittent, when by firing to suit the conditions the extra heat will go to the radiators. If the circulating service pipes are extensive, allowance should be made in the heating surface for the extra water that has to be treated.

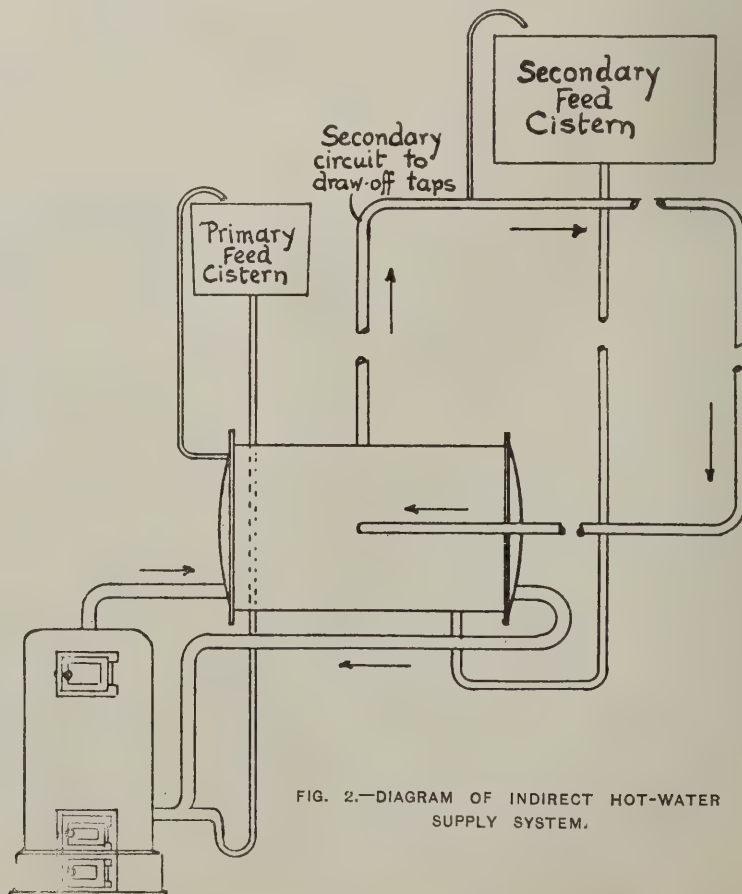

FIG. 2.—DIAGRAM OF INDIRECT HOT-WATER SUPPLY SYSTEM.

SPECIAL DECORATORS' ENAMELS

For HIGH-CLASS WORK.

"O" WHITE

(FOR INSIDE USE).

Covering powers far superior to ordinary Paint, or cheap, so-called Enamels with fancy names.

BRILLIANT GLOSS.

PERFECT SURFACE.

EASY FLOW UNDER THE BRUSH.

Made in Pure White, and can be tinted to any required shade with ordinary stainers.

MANUFACTURED BY

ASPINALL'S ENAMEL, Ltd., New Cross, London, S.E.

THE RESULT OF MERIT.

JAPONIKA

THE PERFECTED ENAMEL PAINT,

Has succeeded in a remarkable manner. Architects are now specifying it, discriminating decorators who have used it are unanimous in their agreement with us that:

1. It is cheaper than any first-class enamel obtainable.
2. It is not excelled in quality by the highest price enamel on the market.
3. The excellent spreading power possessed by **Japonika** (1 gallon will cover 70 to 90 square yards) renders it a very cheap material apart from its cost per gallon.

To DECORATORS.

You will doubtless be called upon during the coming season to carry out many jobs in which enamel will be required. Make yourself acquainted with the merits of **JAPONIKA** now. Its use will enable you to maintain your reputation for high-class work, and at the same time save money.

We shall at all times be pleased to correspond with decorators, and to give our advice as to special treatment which may be necessary when **Japonika** is used.

Trade and Craft.

Cavity Concrete Building Blocks.

The concrete block industry has reached very large dimensions in the United States and Germany, while it is extending to Canada and other Colonies. The possibilities in this direction are apparent, cartage of materials being saved, as any aggregate found on the site can be used with the cement. All that is necessary is a machine to turn the blocks out well and quickly. There are many forms of concrete blocks that have been invented, but all that we have seen have been open to the objection of being too large to handle or manufacture with ease. The Cavity Ventilating Building Block Syndicate,

of 16, Percy Street, Tottenham Court Road, W., have removed this difficulty by arranging the blocks as thin slabs with joints at the back into which a key drops. This key ties the blocks securely together when grouted in with cement-mortar, and holds the blocks apart so as to give a cavity throughout the wall by which ventilation is made easy and damp, cold and heat kept out. Thus a block, instead of being the whole thickness of the wall, is only half the thickness, or less, and can easily be handled without scaffolding or lifting tackle. The moulding is of course made easier, and the machinery used by the company is able to put very great pressure upon the blocks, which allows a large number to be turned out quickly and ready to be stood about to harden, so saving the labour and cost of moulds where blocks are moulded wet. The company, in addition to making blocks and carrying out the erection of buildings, intends to hire out the plant, and we should think there is a very great field for their work. They estimate walls built of their blocks to be 30 per cent. cheaper than brickwork and to possess very considerable merits over the latter material. They also publish several designs for cheap cottages and terrace houses which are estimated to cost less than £150, and as the estimate seems to be based on reasonable

assumptions we shall be very interested to see the outcome of this innovation in building construction.

Simplex Fittings.—The Simplex Steel Conduit Co., Ltd., of Westinghouse Building, Norfolk Street, Strand, W.C., have just issued a small pocket list giving details of the latest additions to their system for electric wiring, as well as the prices of their ordinary and screwed material.

At the United Service Club in Pall Mall, some particulars of the re-decoration and improvement of which were given on p. 19 of our issue for last week, Mr. George Johnson, of 227, St. John's Hill, New Wandsworth, S.W., supplied and erected the new hand-power dinner, coal and wine lifts.

The Marble Mosaic Paving for the new sub-stations at Battersea, Streatham and Wandsworth now being completed in connection with the South London tramway system has been entrusted to the Atlas Stone Co., Ltd., of Cambridge, who carried out similar paving at the New Cross and Camberwell sub-stations for the London County Council, and had the satisfaction of having their work mentioned to the trade by the Works Department as examples of what was required for the new sub-stations above mentioned.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending January 12th seventeen failures in the building and timber trades in England and Wales were gazetted.

G. E. WREN, builder, Gillingham. Adj. Jan. 5th.
GREGG & SONS, builders, Formby. R.O. Jan. 6th.
J. W. HILL, architect, Bridgewater. Adj. Jan. 6th.
T. S. BRAMHAM, builder and contractor, Leeds. Adj. Jan. 2nd.
W. H. LISTER, builder's manager (late builder), Headingley (late Leeds). Adj. Jan. 1st.
W. BUTT, builder, London, E.C. Liabilities £20,713; expected to rank £680, estimated surplus in assets £6,981.
W. W. COOZE, painter and decorator, Newmarket. R.O. Jan. 3rd.
HARDMAN & Co., decorators' merchants, Blackburn. Adj. Jan. 3rd.
H. W. RAMSDEN & Co., decorators, Manchester. R.O. Jan. 3rd.
C. SEWELL, plumber and gasfitter, Abertillery. R.O. Jan. 3rd.
A. H. SLOCUMBE, builder, Teignmouth. First meeting, O.R.'s, Exeter, Feb. 1st, at 10.30. P.E., The Castle, Exeter, Feb. 1st, at 11.30.
W. J. FEEBEN, builder, Deane. First meeting, O.R.'s, Portsmouth, Jan. 18th, at 3. P.E., Portsmouth C.C., Jan. 29th, at 11.
F. J. FRENCH, builder, Bexley. First meeting, 115, High Street, Rochester, Jan. 22nd, at 11.30. P.E., Rochester C.C., Jan. 22nd, at 2.30.
T. B. LAMB, builder and contractor, Preston. First meeting, O.R.'s, Preston, Jan. 17th, at 11. P.E., Sessions Hall, Preston, Feb. 9th, at 11.
A. H. GOODALL, architect and surveyor, Nottingham. First meeting, O.R.'s, Nottingham, Jan. 17th, at 11. P.E., Nottingham C.C., Feb. 2nd, at 10.30.
F. H. CLARKSON, junr., plumber, Ipswich. First meeting, O.R.'s, Ipswich, Jan. 19th, at 2.15. P.E., Ipswich Town Hall, Jan. 19th, at 10.30.

New Companies.

BURYTHORPE SILICA LAND CO., LTD. Capital: £2,000.
DORSET CEMENT CO., LTD. Capital: £5,000.
DOREY BROTHERS, LTD., builders and contractors, Brentford. Capital: £55,000.
J. F. KEATINGE & SON, LTD., to acquire and carry on the business of J. F. Keatinge & Sons, Dublin, painters, decorators, glaziers, carpenters, &c. Capital: £14,000.

Coming Events.

Wednesday, January 17.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. W. T. Oldrieve on "What H.M. Office of Works is doing for Historic Buildings in Scotland," at 8 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Mr. R. G. Hutton on "Jacobean Floral Patterns," at 7.30 p.m.

QUANTITY SURVEYORS' ASSOCIATION.—Adjourned Discussion on Mr. F. B. Hollis's paper, "Some Thoughts on the Quantity Surveyor, and his relation to the Building Owner, the Architect and the Builder," at 7 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Students' Visit to South Metropolitan Gas Co.'s Works, at 2.30 p.m. Annual General Meeting at 7.45 p.m.

AUCTIONEERS' INSTITUTE.—Mr. E. J. Vaughan on "Taxation of Land Values," at 7.45 p.m.

Thursday, January 18.

SOCIETY OF ARTS.—Mr. C. E. Buckland on "The City of Calcutta," at 4.30 p.m.

SOCIETY OF ARCHITECTS.—Mr. Albert C. Freeman on "Planning of Crematoria and Columbaria," at 8 p.m.

Friday, January 19.

INSTITUTION OF MECHANICAL ENGINEERS.—Meeting at 8 p.m.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Address by Mr. E. C. Middleton.

ARCHITECTURAL ASSOCIATION.—Mr. F. Lynn Jenkins on "The Consideration of Sculpture by Architects," at 7.30 p.m.

Monday, January 22.

LIVERPOOL ARCHITECTURAL SOCIETY.—Mr. T. T. Rees on "Architects and the Improvement of Cities," at 8 p.m.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Award of Prizes and Studentships. Messrs. J. M. Swan, R.A., Montague Fordham and Walter Gilbert on "Metalwork," at 8 p.m.

SURVEYORS' INSTITUTION.—Junior Meeting at 7 p.m.

Tuesday, January 23.

ARCHITECTURAL ASSOCIATION OF IRELAND.—Address by Mr. R. M. Butler, at 8 p.m.

Wednesday, January 24.

EDINBURGH ARCHITECTURAL ASSOCIATION (Associates' Section).—Mr. J. M'Kessack on "Architectural Photography," at 8 p.m.

Friday, January 26.

JUNIOR INSTITUTION OF ENGINEERS.—Prof. J. D. Cormack on "Notes on Boiler Trials," at 8 p.m.

MONTHLY

FIRE SUPPLEMENT

TO THE

BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

[Number 16. January, 1906.]

CEMENT-CONCRETE FOR THE PROTECTION OF STEEL IN BUILDINGS.

OF the extensive correspondence in the daily and technical press which has resulted from the Charing Cross Station catastrophe, the question of cement and cement-concrete as an anti-corrosive has been the subject of several writers. We allude to the matter in this supplement because cement-concrete plays such an important rôle in questions of fire-protection for modern buildings.

There can be no doubt, speaking generally, that cement-concrete of a suitable aggregate, carefully applied, forms an excellent fire-resisting covering for steel constructional work, both vertical and horizontal; and whilst it has long been advocated as one of the most suitable and economical forms of affording such protection, its advocates have, however, omitted to claim its consideration at the same time as an anti-corrosive. To put it more pointedly, cement-concrete has the advantage of meeting two of the most important disadvantages of steel frame construction—namely, its liability, if unprotected, to corrosion, and its liability, if unprotected, to failure under fire.

Both as a protection against fire and as an anti-corrosive it is naturally essential that concrete aggregates should be suitable ones, and that good materials only should be used, but given such good aggregates reliance may be safely placed in cement-concrete to meet both the points raised.

In another part of this supplement we deal with a fire test where a porous brick of a well-known English maker was tested as an encasement for steel stanchions, and very excellent results were obtained in three out of the four encasements under examination. A hollow air-space, however, was left between the stanchions and the encasements. It would have been wiser, both from the fire-resistive and from the anti-corrosive point of view, for this space to have been filled in with cement-concrete; for, given concrete and a porous brick facing of this kind, we could safely say that the highest grade of fire-resistance and protection against corrosion would be afforded, for the concrete would be an excellent protective in itself and would be supplemented (i.e. itself protected against damage) by an outer face of porous brick covering of the nature referred to.

When legislative measures are again drafted it would be well if the question of anti-corrosion received attention simultaneously with that of fire-protection, for the two safeguards should be dealt with together and under one scheme. For the present, however, seeing that legislation does not compel such protection, architects and building owners would do well to incur the extra expense of always protecting their steelwork at least with cement-concrete, and thereby assist both in the preservation of their property from the effects of our damp climate as well as from those of the possible fire risk.

FIRE-PROTECTION AND THE GENERAL ELECTION.

THE executive officers of the National Fire Brigades' Union, after consulting with the officers of the other institutions primarily concerned in matters of fire-protection, have decided to enquire of all candidates for Parliament whether they will support the introduction of a Bill in the House of Commons embodying the recommendations of the select committee on fire service matters of 1900, the idea being that it would be of the utmost importance to obtain the support of candidates to this Bill, at the present stage, so that the number of supporters would be known when Parliament meets.

The select committee in question was the outcome of a private Bill presented by Mr. Guy Pym, M.P., a member of the Council of the British Fire Prevention Committee, at the instance of the National Fire Brigades' Union; and as Mr. Guy Pym also happens to be a director of one of the old insurance companies, his advocacy was representative of quite a number of important interests. The recommendations of the select committee of primary importance to architects and surveyors, and more particularly surveyors who hold borough appointments, are the following:—

Some of the Recommendations:

"That an Act of Parliament should be passed repealing all previous Acts so far as they relate to fire, and conferring on fire authorities well-defined powers to provide fire brigades, and to make such other arrangements for protection against fire as they may deem necessary.

"That the local authorities of cities, county and non-county boroughs, and urban districts (defined in the report as 'populous places') should be the constituted fire authorities for those places, and that rural district councils should be constituted fire authorities for dealing with fire in villages, hamlets, and in all other parts of the country except 'populous places,' but that provision should be made to enable any parish council, having regard to the size and population of the parish, to be constituted a separate fire authority.

"That no licence should be granted to any theatre, music-hall or other place of public resort until the local authorities have satisfied themselves that suitable fire appliances and means of escape for the persons frequenting the same have been provided, and that those in charge of such appliances should be qualified men with no other work to perform whilst on duty as firemen.

"That in order to ascertain the extent of the loss of life and property occasioned by fire, fire authorities should be required to send to a Government department full particulars of all fires as they occur, and that annual reports should be published containing the information so obtained."

FIRE-INSURANCE OPINION ON FIRE-PREVENTION.

IN the Fire Supplement of November we dealt with the excellent annual review of fire and fire-insurance matters presented by the "Post Magazine" for 1904, and we also commented therein on the absence of reference under this editorial heading to any matters appertaining to fire-prevention. We suggested at that date that the time had come when the "Post Magazine," even if not seeing eye to eye with some of its older supporters, could quietly but energetically guide fire-insurance opinion in the direction of systematic fire-prevention, to the benefit of the community and of the fire-insurance world in particular. We are now pleased to observe in the record for the year 1905, published on the 6th of this month—a record which in its excellence even surpasses that of the previous year—the following reference to fire-preventive matters:—

"In recent years various local authorities and the public have begun to evince some interest in the question of fire-prevention, and we are encouraged to hope that results of the greatest benefit to the community will ultimately ensue. The necessity for efficient fire-extinguishing appliances and good available water-supply is now more generally recognized, thanks to the increasing efforts of insurance officials. The recent modifications in sprinkler rules, whereby allowances are now made where only one effective water-supply is available, should give an impetus to the use of sprinklers, of which something like a dozen varieties are in the market. The efforts of inventors are at last seriously directed towards the production of fire-resisting materials in construction, and we believe that such devices as wired glass, electro-copper glazing, and the various combinations of iron and cement in floors are rapidly coming into general use. It is not to be supposed that these contrivances can render any building 'fireproof.' Recent experience in America has rudely dispelled that conceit. But it is unquestionable that they afford a sound and reliable means of resisting the spread of fire, thus allowing the brigade to reach the scene of the outbreak before it has obtained complete mastery. This service is invaluable, and we do not doubt that if fire-resisting materials were more commonly employed, the rates would speedily be reduced. Fire-insurance will never be dispensed with, but it lies well within the power of the public to make it vastly less expensive."

The Board of Fire Underwriters, U.S.A.
—The Committee of Twenty of the Board of Fire Underwriters has been compiling a most valuable and independent report on the various cities of the United States from the fire point of view. These are now being issued seriatim and, speaking generally, they are not very complimentary.

BUDAPESTH FIRE CONGRESS REPORT.

WE have in an earlier Fire Supplement dealt with the excellent work done at the International Fire Congress held at Budapest. We have now received the official Congress Report, printed in four languages, which does every credit to its organizers, namely, the International Fire Service Council and the local executive of the Hungarian Fire Service Federation. The trouble taken to print the report in four languages is in itself creditable.

The report comprises a volume of about 400 pages, of which 100 are in the English language. Of the papers, some of which we have already presented and some of which we shall have occasion to reproduce, we would specially mention those on the great Baltimore fire of 1904; the modern theatre; the protection of flour mills from fire; and the impregnation of wood—all of which were read and discussed.

The attention accorded to theatre safety was considerable at this congress; and we would again call particular attention to the following resolution on this point which was unanimously carried: "That it is absolutely essential that all stage scenery and properties be rendered non-flammable in a reliable and permanent manner, and that all the constructional parts of a stage be of a fire-resisting character."

It is certainly interesting in a resolution of this kind, supported by men of eminence of many nationalities, to see the close discrimination between what is considered necessary for stage scenery and what is considered necessary for the constructional parts of a stage. The resolution states clearly that stage scenery and properties should be rendered non-flammable—i.e., what the Americans call "flame-proof"—that is, so treated that they will not catch, sustain nor spread fire, but simply carbonize if in contact with flame. On the other hand, for the constructional parts of a stage everything is to be of a fire-resisting character. This would mean the use of fire-resisting materials and systems of construction—that is, in other words, the metal-framed stage with incombustible flooring wherever possible, and where not possible at least with hardwood flooring 2 ins. thick.

The Chemistry of Fire-protection.

A second resolution in respect to theatres states "that the greatest attention should be accorded to the chemistry of fire-protection in the interests of fire-prevention." There cannot be the slightest doubt that chemistry has not yet been properly applied in the interests of fire-protection, and the sooner the chemists take up this subject the better for fire-prevention generally. There are chemicals in existence that it should be possible to apply practically and commercially to limit the risk of spread of fire, and this applies not only to the theatre but to many other classes of buildings where there are special risks of fire.

Turning to the debate on theatre safety and the use of flame-proof materials, we see one exceedingly valuable suggestion as to this question of the impregnation of materials and theatres, namely, that the chemicals used should be of such a character that the carbonizing of the treated material should be inodorous, or, in other words, that the smell of charring, which so often causes a panic, should be obviated. This indeed is a problem for chemists.

Generally the International Fire Service Council should be congratulated on the fact that its very valuable gatherings also result in some suitable reference book being issued regarding the latest results of the fire-preventive movement, and the latest effort of publishing one of these records in four languages is most laudable.

THEATRE SAFETY.

[We publish below some memoranda prepared by the late Chief Officer Giersberg, of the Berlin Fire Brigade, on the question of the protection of stage scenery from fire. These memoranda were prepared for the Budapest Fire Congress of 1904, but were not brought forward at the time owing to the Chief's ill-health. Herr Giersberg, one of the greatest authorities on theatre safety on the Continent, died shortly afterwards, and it is only now that these memoranda have become public property.]

The memoranda bring forward a feature not generally known in this country, namely, that as far as music-halls, assembly rooms, &c., are concerned, as distinct from theatres proper, there has been a regulation in force in Berlin since 1889 which requires establishments of this kind to have their scenery of incombustible materials, i.e., incombustible in the true sense of the word, such as asbestos board, asbestos cloth, metal and the like.

Herr Giersberg's argument is practically to the effect that asbestos cloth and incombustible material can be so woven and prepared so as to be suitable for scenery, the only disadvantage to his mind being the question of cost, which he puts down for Germany as double the cost of ordinary scenery. He, however, further argues that if incombustible materials are too expensive, it is quite possible to make theatre scenery thoroughly flame-proof by impregnation of existing scenery and the impregnation of the new materials required for future scenery.

At a time when we have but recently heard the chairman of the Licensing Committee of the London County Council point out the importance of rendering scenery flame-proof, and at a time when there has also been a circular letter issued to this effect by the Lord Chamberlain's department, the late Chief Officer Giersberg's contribution to the subject is certainly most interesting and valuable.

In the tenor of Herr Giersberg's memoranda it is also quite clear that he was not satisfied merely with the impregnation of the canvas used in scenery, but considered that the woodwork in and on the stage should be similarly impregnated, which includes a very considerable amount of thin scenery framing and profile work. As to the data he presented regarding the life of impregnated material, namely four to five years for old scenery impregnated and eight to ten years for new canvas impregnated, this is certainly something new. These figures are based, we believe, on certain private experiments which were made in the early 'nineties at Berlin. It would be indeed most valuable if the Fire Prevention Committee could be prevailed upon to undertake some tests in this direction, and would invite the public authorities to actively participate in their direction.—ED.]

FLAME-PROOF THEATRE SCENERY.

By Eric Giersberg, late C.O., Berlin
Fire Brigade.

(Free Translation from the German.)

In dealing with places of public entertainment generally the points which arise first and foremost in the mind of the fire expert are their construction, their fire-resisting qualities, their equipment, and the proper planning and arrangement of their exits. But in the case of the theatre there are also other essentials requiring the most careful attention from the fire point of view, and these are its arrangements for ventilation and the avoidance of all inflammable scenery or other decorative material.

As far as general places of public entertainment are concerned (such as variety theatres, music-halls, assembly rooms, &c.) the last-named point is already provided for under the Police Regulations of October 31st,

1889 (paragraph 74), which compel the use of incombustible materials, such as meta-sheeting, asbestos board, asbestos cloth, &c. This regulation has already proved very beneficial in many directions, and one cannot but wonder why it is not universally applied, both in the interests of the protection of human life and of property.

The stage manager and stage mechanist however, raise numerous objections to the adoption of the regulations in the playhouse. These objections are briefly as follows:—

- (1) That the same artistic effect in colouring cannot be obtained;
- (2) That there is an increase in cost by using tin, asbestos board, asbestos cloth or similar material;
- (3) That there is greater wear in such incombustible decorations; and
- (4) That the increased weight of incombustible scenery is impractical.

One might at first sight agree with the first objection had not time furnished proofs to the contrary in the use of lighting effects on the stage. Regarding the second point raised, a specially-prepared asbestos cloth should well answer the requirements, and any objections as to cost must, if necessary, be overcome. As to wear and tear, surely any scenery which has stood the wear and tear of a season may be deemed to have fulfilled its purpose, and no theatre worthy of the name would use old decorations without first renewing them. As regards the last objection, this should not be raised at all by the modern stage mechanist if his machinery is up to date.

As to the wood employed in the stage machinery, this should be rendered non-flammable by a process of impregnation. The wood loses none of its good qualities in the process, and its weight is only very slightly increased.

The use of hemp ropes should be prohibited, and wire ropes suitably protected should alone be employed, or, if at all necessary, the use of hemp should at least be cut down to a minimum. Thus it is almost possible to banish all inflammable material from the stage, and the stage mechanist is merely confronted with the question as to whether non-flammable materials are easily obtainable and what he is to do with the old material. Needless to say, such a change cannot be effected all at once, but wherever new plays are produced the scenic effects and decorations for same should be of non-flammable material only, and for the rest the old material might be rendered so in time.

The Berlin Police Regulations, dated October 12th, 1899, section 23, make it compulsory in all new buildings that the curtains, scenery and other stage effects be made of non-flammable material as far as this is possible. Since the above regulation has come into force, how much has been done to comply with it? We find but very little. Most of the theatres which should have rendered their scenic effects non-flammable as far as was possible have done nothing at all, and this either because the objections above raised have not been disproved, or owing to an apparent lack of funds for this form of improvement on the part of the various theatre managements.

As to what has been done in this direction of rendering scenery non-flammable outside Germany, we find that the Governor of Lower Austria, under a decree dated July 1st, 1882, ordered that all scenery and other stage effects (excepting furniture) must be rendered non-flammable before being used. These regulations have been in force with marked success in Austria for over twenty-five years, and, with slight modifications, they have also found adoption in the theatres of Leipzig and Dresden. In accordance with a regulation of the Vienna Town Council, under date April 19th, 1883, theatre managers have to make formal application for an official inspection

of all new scenery at least three days before it is intended to use the same on the stage.

What has been accomplished in Austria could easily be done in other countries. And the regulations, besides enforcing the use of non-flammable material for new scenery should also include a clause for the rendering "non-flammable" of old materials by a process of impregnation.

Cost of Impregnation.

Objections are raised against the costliness of impregnation, its bad effect on colouring and the bad effect of the dust arising out of same on the voices of the artists and the general health of the stage hands.

As to the cost of impregnation, the table below will give some information. As to the bad effect on the colours, this is easily remedied. The last-named objection falls to the ground if we take into regard the experience of the theatres before named.

The modern process of impregnation has attained such perfection that any objections to it are scarcely justified—in particular the one of colour, as, if the colouring is applied after impregnation, it loses none of its splendour or brilliancy. If the regulations do not enforce the use of absolutely fire-resisting decorations they should provide for the impregnation of all decorations by means of a recognized and well-tested process. In view of past experience and experiments the day may not be far distant when it will be possible to render hemp ropes non-flammable by special chemical process, and if it should not be possible to render them absolutely non-flammable the submission of them to a process of this kind will at least prevent their being the means of spreading a fire.

It goes without saying that the effect of such impregnation on materials, ropes, &c., which are handled very much and folded, will only be a temporary one, as the process does not change the material in any way, but merely provides it with a fire-resisting coating. From experience it has been found that supplementary impregnation will last some four or five years, whilst, on the other hand, materials treated before they have the colouring applied will retain their fire-resisting properties for as long as eight to ten years.

The table below furnishes some data regarding the cost of non-flammable decorations in a theatre of medium size.

The following would approximately be required for the equipment of the stage:—

- (a) Curtains, 120 sq. m.
- (b) Out-cloths, 120 "
- (c) Wings, 175 " (8, of about 22 sq. m. each).
- (d) "Borders," 175 " (8).

Total 590 sq. m.

The figures in the table below are based on a stage equipment requiring some 600 sq. m. of canvas per scene:—

Description of material.	Price per sq. m.	Total cost of 600 sq. m.	Total cost of equipping five scenes requiring 600 sq. m. each.
Canvas not specially treated - - -	marks. 2'50	marks. 1,500	marks. 7,500
Impregnated canvas - -	2'80	1,680	8,400
Cost of the supplementary impregnation of existing scenery - - -	0'30	180	900
Asbestos cloth - - -	5'00	3,000	15,000

NOTE.—1 mark equals approximately 1 shilling.

The above figures will show that the price of incombustible material (*i.e.*, asbestos cloth) is double that of ordinary materials, and thus these prices would need careful consideration, as otherwise many theatres would be quite unable to afford such material. If, however, the other expenses of the theatre are borne in mind, such as salaries paid, &c.,

one would feel inclined to think that it is possible to meet the demands imposed by regulations to render the theatre safe against fire by taking the necessary safeguards in providing incombustible scenery.

As to the difference of cost between ordinary canvas and treated canvas, it is infinitesimal. Even the cost of treating existing scenery is but small in Germany. Thus, for instance, the Schiller theatre in Berlin has about thirty-five plays on its repertoire with an average of five different scenes each, and it may be taken that to render all this scenery non-flammable an expenditure of something like 32,000 marks (£1,600) would have to be incurred. The scenery so treated would, however, be good for quite five years, and thus this sum of 32,000 marks could be distributed over that period and would only mean an annual expenditure of £320. The minor decorations and properties have not been taken into account in this estimate. Further, no account is taken of transparencies. These as a rule, however, only have small surfaces.

To sum up: It is of the greatest importance to do all that is possible to render the theatre safe as far as its scenery is concerned, and even to enforce the necessary regulations

to that effect, even if (what is highly improbable) the beauty of the scenery be slightly impaired. Otherwise the best of planning, the good arrangement of exits and careful construction would be of little assistance in the event of an outbreak of fire.

THE VIENNA PANORAMA FIRE.

THE accompanying illustrations relate to a fire which took place some years back, but it is so instructive as indicating the extraordinary effect of fire upon unprotected steelwork that we reproduce the photographs to serve as object-lessons of what even a small amount of inflammable material will do in wrecking a steel building where no suitable protection is provided.

The total amount of inflammable material in this building comprised the usual canvas panoramic view hung round the panorama walls, circular in plan; further, a platform and staging of woodwork from which the visitor viewed the panorama; and, lastly, a few properties of the usual canvas and wood type common to panorama effects. The fire immediately caused the collapse of the roof, and the wreckage resulting from this collapse is practically unique.

THE RUINS OF THE VIENNA PANORAMA FIRE.

FIRE AT CORBETT'S IRONWORKS SHREWSBURY, ON NOVEMBER 20TH, 1905.

RECENT FIRES AT SHREWSBURY.

SHREWSBURY has had some serious fires during November and December, namely, the fire at Corbett's ironworks and that at the well-known Shrewsbury school.

We reproduce herewith two photographs of each of these fires. Regarding the Shrewsbury school, it was the roof of the main building that became ignited, and for all practical purposes the roof was burnt up and much damage done to the building. A photograph of one of the large rooms in the roof shows, however, how the heavy timbering resisted the flames, and this photograph is an example of the often-told lesson that hardwood is an excellent fire-resistant.

As to the fire at Corbett's ironworks on November 20th, this example is presented as an instance of an entire "burn out" or gutting of important factory premises, owing mainly to lack of suitable construction.

It is of course argued by many that the factory owner is covered by his fire insurance policy, but a burning-out of this description, which means entire reconstruction of a factory and re-equipment, occupying a considerable period, cannot be discounted by any insurance premium, covering the actual values of the materials in stock and the time lost in the disarrangement of business, and generally also the trade loss during the interval.

EXISTING BUILDING REGULATIONS FOR PROTECTION FROM FIRE, WITH SUGGESTIONS.

By **JAMES SHEPPARD, A.Inst.E.E.,**
Insurance Surveyor.

(Concluded from p. 45, Supplement No. 14.)

MOST by-laws require the building of a parapet to any external wall of a new building that may be less than 15ft. distant from any other building. The London Building Act contains no provision of this nature, but requires the eaves to be of "fire-proof" material.

The large extent of window and other openings in external walls are responsible in crowded districts for many conflagrations. The London Building Act restricts the area of such openings in external walls above the ground storey to one-half the whole area of such part of the wall. This or a more stringent regulation has been in force for nearly fifty years, but buildings in many of the narrow streets of London bear evidence that it has been frequently evaded. The Glasgow Building Act, 1900, contains similar restrictions on the area of openings in external walls. Other by-laws simply state that where the area of openings in an external wall exceed one-half the whole area of the elevation of the wall, sufficient piers must be provided. In nearly all provincial

towns, therefore, the spread of fire is in no way checked by a limitation of the extent of openings in external walls.

Timber and Party-walls.

The ends of timbers in party-walls are required in most by-laws to be at least $4\frac{1}{2}$ ins. from the centre of the wall, but in Glasgow and some other places beams may be fixed in party-walls with $4\frac{1}{2}$ ins. only between their ends, and the Manchester by-laws allow a cast-iron beam box, if having a solid back, to be placed on the centre line of a party-wall. If two such boxes are placed back to back, as appears to be allowed, the distance between the ends of wood beams of different buildings would not be more than 2 ins., or at most 3 ins. This and $4\frac{1}{2}$ ins. only of brickwork between the ends of beams cannot be considered to be sufficient to prevent fire extending from one building to the other. It is desirable to provide that beams, whether of wood or iron, resting in party-walls should be so arranged that in falling during a fire they would not exert leverage on the wall which might displace a large portion and allow fire to pass.

Door and Window Frames.

The London Building Act, 1894, allows door and window frames to be fitted flush with the face of any external wall, but the regulations of most other cities and towns require such frames to be set back in reveals 4 ins. at least from the outer face of such wall. The fixing of hollow wooden sash frames flush with the wall, as now allowed in London, is likely to assist the spread of fire in narrow streets and light areas.

Hollow Partitions.

If combustible hollow partitions are allowed—which they are not in some by-laws—it is in every way desirable that the open space inside any such partition or between the joists in any wall should be stopped with brickwork or other incombustible material at every floor and ceiling. This is a valuable provision contained in the Model and many other by-laws for retarding the rapid spread of fire, but it has no place in the London Building Act, 1894.

The London Building Act, s. 62, however, contains provisions requiring that the storey constructed in the roof of any new domestic building, the floor of which is more than 60ft. above street-level, should be constructed of fire-resisting material, and suitable means of escape in case of fire provided for persons dwelling or employed therein; and s. 153 (3) of the Factory and Workshop Act, 1901, empowers the L.C.C. to make by-laws for means of escape in all factories and workshops, whether exceeding 60ft. in height or not.

Combined Trade and Domestic Buildings.

Buildings exceeding ten squares in area (s. 74) used partly for trade or manufacturing purposes, and partly as dwellings, are required to have the dwelling portion completely separated from other portions by fire-resisting floors and walls. Why this very necessary provision should only apply to buildings exceeding ten squares in area is not clear; experience has frequently shown that the danger to life in buildings having such double occupation is quite as great in small as in larger buildings.

Buildings exceeding twenty-five squares in area containing separate tenements must have the floors and principal staircases of fire-resisting material.

Public buildings and every building constructed or adapted to be used as dwellings for separate families exceeding in capacity 125,000 cub. ft. (s. 68) are required to have the floors of the lobbies, corridors, passages and landings, and also the flights of stairs, constructed of and supported by fire-resisting material. In such buildings it is as necessary to require that all floors be constructed of fire-resisting material as with buildings exceeding twenty-five squares in area.

INTERIOR OF CORBETT'S IRONWORKS, SHREWSBURY AFTER THE FIRE.

The foregoing rules, distributed over the London Building Act, would be much clearer if collected under one section.

A Bill ordered by the House of Commons to be printed July 15th, 1902, proposes to repeal the limit of forty persons contained in the Factory and Workshops Act, 1901, and also to give district councils power to regulate the position and nature of enclosing lift wells, holes or shafts—air shafts and any other shafts or flues by which flame or smoke may be drawn or induced to pass from one part to another part of a factory or workshop. This is a very necessary provision, otherwise a sudden rush of smoke from a fire on other floors to the floor on which persons are employed might prevent their access to escapes that may have been provided. It is to be hoped that the Bill will become an Act.

In Glasgow, if lifts are enclosed, such enclosures must be of fire-resisting material, protected at the top or carried through the roof.

Regulations for enclosing escape stairs in accordance with provisions in the Factory and Workshop Act, 1901, will assist in retarding the spread of fire, but no corresponding regulation can be made at present for trade and warehouse buildings which are outside the Factory and Workshop Act.

Aids to the Spread of Fire.

The rapid spread of fire is greatly facilitated by the following:—

Open stairs and lifts from floor to floor; shaft through floors; holes for pipes through floors.

Well-holes through floors.

Wood linings to walls and ceilings.

Concealed spaces behind linings and casings, between ceilings and floor boards, and about roofs.

Window and other openings opposing across narrow streets and passages or in lighting areas, or near each other in any direction.

Timber roofs having a steep pitch, covered only by slates, lead or zinc.

What can be done.

All the foregoing defects can be readily met, and should require to be so in all districts crowded with buildings of considerable size, stocked with inflammable goods.

Stairs, lifts and shafts can be enclosed with fire-resisting partitions and doors, and all holes through floors protected.

Well-holes and other openings through floors can be fitted with sliding shutters.

Wood linings to walls and ceilings can be replaced with plaster.

Dangers arising from concealed spaces between ceilings and floor-boards can be lessened by pugging.

Windows and openings opposing or near each other can be protected by revolving or other shutters or by metal frames and sashes glazed with wired glass.

Roofs can be covered with tiles, or, preferably, constructed entirely of incombustible material.

The Smoke Difficulty.

Practical firemen of the old school usually favour provision for the escape of smoke, and have even expressed preference for a light roof that will quickly burn off and allow smoke and heat free vent, but in crowded districts this allows of the rapid spread of fire to surrounding buildings. The smoke difficulty may be to a large extent overcome without assisting the spread of fire by the use of water spray for throwing down smoke, smoke helmets and searchlights.

Large old buildings filled with inflammable goods, surrounded by buildings erected in accordance with present regulations, may involve the destruction of a whole district; all such buildings should be required to conform to existing by-laws before the expiration of five years from the date of formal notice to carry out necessary improvements.

Owners and occupiers of buildings in-

volving serious danger to their neighbours should not be allowed indefinitely to jeopardize the safety of surrounding property. Throughout France the occupier of premises where a fire originates is liable for any damage that may result from such fire to the property of his neighbours, unless he can show that the fire was caused by some structural defect over which he had no control, in which case liability falls on the owner of the building. The application of a law of this nature places the burden on the right shoulders and encourages the erection of slow-burning buildings, with the result that conflagrations involving several separate buildings are very rare in Paris, if not altogether unknown, and the same may be said of other Continental cities.

(e) Administration of Building Regulations for Protection from Fire.

The settlement of questions that arise in the application of building regulations are usually referred in the first instance to police magistrates, and decisions are sometimes given which, if meeting the letter of the provisions, are strangely at variance with their general bearing and intention. A lamentable instance of this is shown in connection with the great Tooley Street fire of 1861. A building involved in that fire, which had been recently erected, considerably exceeded the limit of 216,000 cub. ft. applicable to such buildings. The case was taken by the district surveyor before the magistrate, who considered that the horizontal divisions formed with brick arches or cast-iron girders about 13ft. apart supported on iron posts constituted party-walls and met the requirements of the Act; notwithstanding the utter collapse of the above building under the action of fire, the magistrate's decision continued to be acted upon, resulting in the erection of many most dangerous buildings, until 1892, when a case was taken before the higher courts and a decision was given in 1894 that a so-called fireproof floor was not a party-wall within the meaning of the Act. The illegal building in Tooley Street may have contributed to the disaster which caused the death of James Braidwood, one of the most courageous and successful firemen of the nineteenth century. Mr. Braidwood in May, 1856, read a very valuable paper before the Society of Arts on "Fires, the best means of preventing and arresting them, with a few words on fireproof structures"; he then expressed the hope that the new Building Act (Metropolitan Building Act, 1855) which had come into force on the 1st January previously would repress some of the great evils that had arisen, but expressed the fear that the meaning would "be subverted by some such subterfuge as destroyed the efficiency of the previous Act." In this he was truly prophetic. The present London Building Act, 1894, is in many respects less satisfactory than the Act of 1855, and the tendency of magistrates' decisions has been to further weaken some of its more important provisions. A separate court assisted by assessors, similar to the practice adopted in marine cases, is needed for the consistent application of the London Building Act.

Builders' Support Needed.

To secure full compliance with the provisions of building regulations it is necessary to have the cordial support of the builder and his foreman, who have hourly control over the execution of the work. In Vienna, with the view of obtaining such assistance, all builders and their superintendents are required to obtain official certificates of efficiency for the building operations they undertake, and are held responsible for any work contrary to regulations.

In May, 1892, the United States Consul-General at Vienna, reporting to his Government on the subject of fire and building regulations, stated that "There is no case

known in Vienna where a conflagration has extended beyond the building in which it originated, and even hardly any cases are known where a fire extended beyond the floor on which it originated." "This is prevented by the solidity of the buildings, by strict fire regulations, and by a pretty-well-trained fire department." "The conflagrations at the Ring Theatre and the Stadt Theatre in 1882, and incendiary conflagrations amongst the timber yards near the Danube Canal, did not extend to adjoining property." The application of similar regulations to other cities may be expected to give corresponding results.

Fines.

It is admitted by those having the widest experience that the exercise of reasonable intelligence, care and forethought would prevent the occurrence of nearly all fires. This being an undoubted fact, it would be only just to require occupiers of premises where fires occur to pay a suitable fine adjusted on such scale that the total would meet at least half of the expenses of maintaining a brigade and appliances for extinguishing fires. If the occupier is able to prove that the fire originated from some defect in the construction of the building of which he could have no knowledge or control, the owner of the building should be liable for the fine payable in respect of the fire. In this way part at least of the burden caused by avoidable fires would be equitably distributed.

Reports.

It is necessary under the Factory and Workshops Act, 1901, for occupiers to report all accidents that may happen in connection with their premises to which the Act applies causing loss of life or bodily injury, preventing any person from being employed on their ordinary work for five hours on any one of three working days next after the occurrence of the accident.

Fires cause serious danger to life and limb, and it is desirable to require that the occurrence of all fires, however slight, should be included in the above reports, recording the date of fire, the use made of the portion of premises where fire originated, nature and extent of damage, cause or probable cause of the fire, and how extinguished. The simple fact that reports of this character must be made would have a beneficial influence over a great number of premises throughout the country, and tabulated statements of these fires would be of great value, while the additional expense would be nominal.

(2) *Regulations for the transit, storage and use of specially inflammable or dangerous substances, and the mode of warehousing merchandize and general goods.*

Regulations of this nature are chiefly, if not altogether, confined to the Explosives Act, 1875, and Explosive Substances Act, 1883, and the Petroleum Acts, 1871, 1879 and 1891. These Acts apply only to actual explosives, to petroleum, spirit, viz., any mineral oil having a flash point (Abel test) below 73 degs. Fahr., and since 1897, by Order in Council, under section 14 of the 1871 Act, to carbide of calcium; but many other substances, although comparatively harmless under normal conditions, lead to most disastrous explosions when burning with other materials. Experience has frequently shown this to be the case with nitrates, chlorates and substances containing an excess of or having a special affinity for oxygen; and it is certainly desirable to place the storage of all such substances under suitable control. Celluloid, extensively used for all kinds of purposes, is also a dangerous substance.

Petroleum oil having a flash point over 73 degs. Fahr., when stored in large quantities is a source of great danger, in the event of fire unless proper provisions are made to prevent outflow; and serious explosions have

SHREWSBURY SCHOOL FIRE.

occurred by the vapour slowly given off from petroleum having a flash point considerably over 100 degs. Fahr. mixing with air in the enclosed space of huge tanks, being fired by a lightning flash notwithstanding special precautions to guard against this danger. A case of this kind occurred at Harburgh in 1895, when the top of a steel tank 70ft. in diameter was torn into sections and scattered over a space within a radius of 300 yds. Many such tanks exist in different parts of the United Kingdom, some of them surrounded by numerous dwellings, and the country may yet have to regret the delay in passing the Inflammable Liquids Bill. Experience has shown that further regulations are needed for the control of the transit of mineral spirit.

Any inflammable liquid or substance that becomes liquid under a moderate heat, as tallow and wax, if stored in the upper part of a building, is a source of danger to life in case of fire.

Fibres and other goods which expand when soaked with water—and this occurs in case of fire—seriously endanger life if stored against walls.

Regulations should be made to guard against the foregoing and similar dangers, if only in the interest of the brave firemen, salvagers and others whose duty it may be to attend fires. This is a matter requiring serious attention.

- (3) *Provision of suitable water-supply, with appliances and organization for the early discovery and extinction of fire, and the saving of life and property, including the preparation of annual returns of the works of fire brigades.*

The question of water-supply and fire brigades covers a very wide field, needing a separate paper for full treatment.

Local authorities have powers to require the fixing of fire-plugs or hydrants (at their own expense) on the mains of most water companies, but very little, if any, power over the size of mains or the pressure of water. This difficulty is avoided where the local authority provide a public water-supply for their district.

Local authorities have power to maintain brigades and appliances for extinguishing fires, and parish councils may unite with other local authorities for this purpose.

It is an important part of fire-brigade work, especially in the crowded districts of great cities, to make suitable provision for the early discovery of fire, and the instant use of first-aid extinguishing appliances, at the same time calling the brigade. In the absence of such provision it frequently happens that the most efficient and powerful brigades are unable to prevent the destruction of extensive premises, and at times are powerless to prevent a fire extending to all surrounding properties.

- (4) *The preparation of annual returns clearly showing the work of the brigade, with the nature of successes and failures in different districts.*

Returns of this nature are needed for the maintenance of due efficiency. In this respect many of the provincial brigades are far in advance of the metropolitan brigade. The annual reports of the latter, although admirable as far as they go, fail to show whether the brigade is more or less successful now than in past years.

The tables comparing the percentage that so-called "serious fires" bear to the total number of fires in different years are misleading, because the totals include numerous fires extinguished without assistance from the brigade, and such small fires now amount to about half of the total number. The standard for a "serious fire" has also been gradually increased.

To afford a clear statement of results achieved by a fire brigade it is desirable to tabulate information on the following points:—

- Number of fires included in the total extinguished without assistance from the brigade -
- Number of fires extinguished by the use of brigade buckets only -
- Number of fires extinguished by the use of brigade buckets and hand pumps only -
- Number of fires at which it was necessary to use one stream from branch pipe only -
- Number of fires at which it was necessary to use two streams from branch pipes only -
- Number of fires at which it was necessary to use three streams from branch pipes only -
- Number of fires at which it was necessary to use four streams from branch pipes only -
- Number of fires at which it was necessary to use five streams from branch pipes only -
- Number of fires at which it was necessary to use more than five but under ten -
- Number of fires at which it was necessary to use more than ten but under twenty -
- Number of fires at which it was necessary to use more than twenty but under thirty -
- Number of fires at which it was necessary to use over thirty -

Fires should also be classed according to the quantity of water used and the time occupied in extinguishing them.

Information of this character given for different districts of large cities would be of great value, showing when alteration of existing arrangements may be needed.

- (5) *Provision for the discovery and punishment of persons causing fires wilfully or by gross negligence.*

The only law having a definite bearing on this subject is the City of London Fire Inquest Act, 1888, which gives powers to the coroner for the City of London to hold an inquest on any fire if either the Lord Mayor of London, the Lord Chief Justice of England, or one of His Majesty's Principal Secretaries of State, or the coroner, is of opinion that proper cause for such enquiry exists. Some important enquiries have been held under the powers of this Act, and valuable verdicts given, but there appears to be no power, other than public opinion, to secure the adoption of improvements shown to be necessary.

For daily application some enquiry far simpler than a formal coroner's inquest is needed. It is very desirable that the police supervision and powers in connection with fires should be considerably enlarged, and that in addition to simply reporting the occurrence of fires at which members of the force attend, as at present, the police should appoint suitable officers to make special examination and preliminary enquiry and report to the Police Commissioner, or chief constable of the district, who should have authority to order further enquiry or take such action as he considers desirable in the interest of justice. In this way the recurrence of fires on the same premises or on property held by the same persons would be recorded with other valuable information, and many fraudulent fire-raisers brought to justice. 8†

NOTE.—Since the above was written the Model By-laws referred to have been revised, but the provisions relating to protection from fire have not been in any way improved.

SHREWSBURY SCHOOL FIRE.

FIRE TESTS.

STANCHION ENCASEMENTS.

NO more important subject could come up for investigation at the present moment than that of suitable encasements for stanchions, for it is on the stanchions that so much of the weight of a building nowadays rests, and the slightest failing of these supports brings down a structure.

Up to the present the subject has not yet had the attention it should command, being obscured by questions appertaining to floors, partitions, doors, &c., but a commencement has been made with a test of four different column encasement put forward by Mr. Jabez Thompson, of Northwich. The principal object of a test with a column encasement must necessarily be its resistance against fire at high temperatures. Further, there is the question of conductivity of the material used for the encasement. As to the actual effect as to the temperatures which are reached in the metal of the stanchion so encased, it is of value to know the exact temperatures; for from these the decreasing strength under different loads and at different temperatures can be easily ascertained. The encasements under test and the results

upon each are best described by extracts from the official report (No. 104), followed by the summaries of the results.

The Encasements.

Stanchion No. 1 was encased with "Terrawode" bricks 9ins. by 4 $\frac{3}{8}$ ins. by 3ins. The outside measurements of the encasings were 13 $\frac{1}{2}$ ins. by 15 $\frac{3}{4}$ ins. This was a square encasement, unplastered, 4 $\frac{3}{8}$ ins. thick.

Stanchion No. 2 was encased with square "Terrawode" tiles 2 $\frac{1}{2}$ ins. thick, in four sections, having a continuous joggle at each vertical joint, the tiles as delivered measuring 9 $\frac{1}{2}$ ins. by 12ins. The outside measurements of the encasings were 12ins. by 12ins. This was a square encasement, unplastered, 2 $\frac{1}{2}$ ins. thick (0635 m.).

Stanchion No. 3 was encased with circular "Terrawode" tiles 3ins. thick, in two sections, having a continuous joggle at each vertical joint, the tiles measuring 14 $\frac{1}{2}$ ins. outside diameter, the height of the tiles being 12ins. This was a round encasement, unplastered, 3ins. thick.

Stanchion No. 4 was enclosed with circular "Terrawode" tiles 2 $\frac{1}{2}$ ins. thick, in two sections, having a continuous joggle at each vertical joint, the outer diameter of the tiles

measuring 13 $\frac{1}{2}$ ins., the height of the tiles being 12ins. Metal cramps were inserted in the beds at each joint. The outer face of the tiles was grooved for plaster and plastered with three coats of lime and hair-mortar. This was a round 2 $\frac{1}{2}$ ins. encasement, plastered, in all 3ins. thick.

The casing in each instance was bedded and jointed in mortar made with plaster-of-Paris, powdered fire-clay and sand, in equal proportions. The spaces between the stanchions and inner face of the casing was not filled in.

The height of the stanchions exposed to the fire was 8ft. 10ins.

Summary of Results.

Stanchion No. 1 (Square).—The angles of several of the bricks encasing this stanchion split off or cracked, and the face of some of the bricks were splintered. The maximum temperature recorded between encasement and stanchion was 310 degs. Fahr. after 150 minutes.

Stanchion No. 2 (Square).—The tiles encasing this stanchion commenced to split at the angle joints after 45 mins.; this increased during the test, and some of the tiles were displaced, partly exposing the stanchion. The maximum temperature recorded between encasement and stanchion was 1,100 degs. Fahr. after 150 mins.

Stanchion No. 3 (Round).—Four of the tiles cracked vertically during the test. The maximum temperature recorded between the encasement and the stanchion was 500 degs. Fahr. after 150 mins.

Stanchion No. 4 (Round).—Surface of plastering flaked off. A local bulge of about 1in. for a height of 18ins. appeared in the plastering of the encasement 2ft. above floor level. The maximum temperature recorded between the encasement and stanchion was 590 degs. Fahr. after 150 mins.

The application of water washed off much of the plaster remaining on the encasement to stanchion No. 4, but had no effect that could be seen on the encasements to stanchions Nos. 1, 2 and 3. The steel stanchions in each case remained in position apparently unaffected.

Comments by Mr. James Sheppard.

In the prefatory note to this report Mr. James Sheppard gives the following as his views on the test, and architects should note well the lessons of this test, which are so strongly in favour of encasements circular on plan:—The encasements under test for 2 $\frac{1}{2}$ hours were of similar material to that used in the partition under test for four hours (as recorded in the Committee's publication, No. 84), and demonstrated that materials encasing an independent metal stanchion are subjected under the action of fire to far greater strain than when used in other positions. The test also proved that circular forms offer greater resistance to heat and fire than that afforded by similar material having exposed angles.

CEILING TEST.

Report 105 issued by the Fire Prevention Committee deals with a test of "Kulm" pumice ceiling slabs intended to afford temporary protection against fire, the result of which was that the fire and water test was withstood for a period of three-quarters of an hour at temperatures ranging up to 1,600 degs. Fahr., whereby the classification temporary protection was attained. The idea of utilizing pumice slabs for ceiling protection is the provision of protection against fire from below in existing buildings which have wood joist floors, and where the entire removal of these and the substitution of solid fire-resisting floors would be impracticable. The test is certainly an important contribution to the subject of protection against fire in existing premises, a most important matter having regard to the legislative enactments as to the separation of different risks in existing buildings.

Stanchions Nos. 3 and 4 after Test.

0 10 20 m

RUE DE LONDRES

THE HARBOUR FIRE STATION AT GHENT.

PROGRESS DURING THE YEAR.

The British Fire Prevention Committee has made further progress during the year 1905, and the following are some par-

ticulars. The membership has increased during the year by 75 and the subscribers (non-members) by 35.

During the year the testing station was

removed to Regent's Park and equipped with additional testing chambers, &c., the removal and extensions involving a further capital expenditure of over £1,100.

The testing operations for the year have increased from 6 to 17. During these 17 testing operations, the following subjects have been under investigation:—4 floors, 1 ceiling, 4 partitions, 1 wall, 4 column encasements, 5 casements, and 4 skylights with special glazing, 2 doors, 1 shutter, 7 concrete aggregates and one fire-alarm.

The Committee rendered considerable assistance in matters appertaining to the amendment of the London Building Act, and has been in close touch with kindred societies at home and abroad for interchange of experience as to joint action on matters relating to fire-prevention.

A competition for the production of a useful fable for children, setting forth the dangers of fire, has been dealt with.

The Committee have suffered severely through the deaths of distinguished members and office-holders, the deaths during the year including:—Messrs. Thomas Blashill, F.R.I.B.A., H. H. Collins, F.R.I.B.A. (members of council); Mr. Ellis Pritchett, F.R.I.B.A. (member of executive); Dr. Edward Atkinson, LL.D., of Boston, U.S.A., and Chief Officer Giersberg, of Berlin (hon. members); Sir Henry Irving, LL.D., Mr. Ray, late manager, Hand in Hand Insurance Co., and Lieut.-Colonel Dixon, V.D. (members).

GHENT FIRE STATION.

THIS new fire station fulfils a somewhat different purpose to fire-stations generally, inasmuch as its primary object is to house a staff of men who can be brought into operation with portable appliances and those which are already in position. Thus the station is primarily a barracks rather than a fire appliance dépôt in the ordinary sense.

A special feature of the station is that instead of giving a fireman a few rooms in the form of a flat or tenement, each fireman has a miniature cottage or house, comprising two floors, very compact in itself and giving them a feeling of far greater comfort and independence than would be the case when he is housed in the ordinary way. These cottages are arranged so that some front the main thoroughfare and some front an open mutual courtyard. The central feature of this block comprises a kind of fire-appliance room on street level with a gymnasium above, the gymnasium being accessible from the appliance room.

As will be seen from the drawing, the engine-room is marked 1. The two larger of the cottages are given to the station officers or foremen, and these are marked on the drawing 2. The two senior firemen each have cottages slightly superior to the firemen's, and these are marked 3.

HOMAN'S STEELED CONCRETE FIREPROOF FLOORS.

Constructional Steelwork of
all kinds.

ROOFS, BRIDGES, PIERS,
JOISTS AND GIRDERS.

ALSO

GRANITE PAVING,
ASPHALTE, &c.

ADVANTAGES OF THIS CONSTRUCTION.

- Cheapest form of Fireproof Construction extant.
- Less Steel than other Systems.
- Bays securely tied together.
- Less thrust on Walls.
- Spans to 30 ft. without main Girders.

Park Architecture. In the Metropolis the various parks and open spaces are under the control of a separate department of the London County Council, but in the provinces the borough surveyor generally has charge of these necessary "lungs" of towns. Under either, however, they are not in the right hands. The distressing way in which formal features such as bandstands, shelters and ponds are placed in the midst of informal surroundings without any attempt to lead up to them by a formal garden treatment will occur to everyone; and when, indeed, a formal treatment is attempted the outlines are often ugly, while the architectural details supplied by borough surveyors are simply abominable. In a few towns the city architects happily have the designing of the open spaces, but where there is no architect's department the work of laying out parks, gardens or recreation grounds should be put into the hands of a local architect. The London County Council is, however, a special sinner in this respect. It has an architect's department possessing a good deal of talent, yet it does not seek its aid. A great deal of improvement has been effected, it is true, in the open spaces of London, but not in regard to beauty of laying-out. Now is the season when some needful alterations could be made. Such an

opportunity of enhancing the appearance of our public places ought not to be lost. The fact cannot be over-emphasized that it is a mistake to leave these matters to the tender mercy of the ordinary park gardener, because he is not trained sufficiently to know how the work should be carried out, his ideas being too limited and narrow to embrace the larger aspect of landscape gardening.

Building without a Builder. UNDER this heading a writer in the current issue of the "World's Work and Play" deals with the new school of architects whose work has excited a considerable amount of interest for many years past, namely, the school of Professor Lethaby, Mr. E. S. Prior, and others whose names will occur to our readers. The ideas of this school are not new. They were advocated by Pugin and the Gothic Revivalists, and not least by Ruskin. Briefly stated, their ideal may be said to be a return to the system of the master-builder and craft-guilds. It may be wondered that with all this eminent advocacy the principle of the architect being trained as a workman and acting as the contractor—indeed, almost as foreman—has not been largely adopted. As it is, we find that, apart from a number of houses and a small village church or two, there are no modern buildings to which we may point as proof that the system is possible of adoption for large structures. The principle has only been adopted by faddists. It can be followed in the case of some small houses and cottages for the agricultural labourer, where the intermediate profits of the builder can be saved; but upon a large job the client usually desires some definite idea as to what the cost is going to be, and this the very nature of the system of modifying, amending, and perhaps "improving" as one goes on renders impossible. Moreover, the system is not a speedy one, and rapidity of erection is essential for any building intended for business purposes. To retain any reasonable speed in the erection of a building of some size there must be a definite scheme to work upon, so as to enable the many trades engaged to co-operate without friction, otherwise one trade has to wait upon another and the cost is increased and the building in the meantime is delayed. The whole tendency of modern work is towards more and more elaboration of the working drawings, more exactness, and more preparation ahead. The natural advance of all constructional knowledge requires the architect to seek assistance in many directions from specialists, and so far as we can see he cannot occupy the position of a master-builder closely in touch with the crafts. This brings us to the second point of the argument of this particular school of architectural thought, namely, the education of the architect. It is easy to speak of architecture being a trade and to show how much assistance can be given by working at a craft, but life is

too short, and the architect cannot acquire knowledge of all the trades in the manner suggested. Moreover, he has to deal with other things than construction. He must possess business aptitude, a faculty for organization, a knowledge of modern commercial methods, a certain amount of literary ability, legal knowledge, and generally he must occupy an altogether higher plane of education to the ancient master-builder. We do not think it is at all necessary to return to former methods of education. We believe that our modern methods are an evolution from the old, and that they enable us in the same time, or in less time even than of old, to acquire a much greater amount of knowledge. The architect must know his own craft, which is the position of an organizer of building works. To occupy this position he does not need to be a skilled craftsman, a specialist in any trade, but he must know the general bearings of each branch of the subject. We think sufficient can be gained from visits to shops and actual buildings, and instruction from specialists in each field, grounded upon good scientific and commercial education, and we see no use in the return to the ancient building system which is advocated by some architects of note. We have every sympathy with their endeavours to educate the architect and make him more of a practical man, but their methods of education have limitations. We would not say anything regarding the talents or constructive ability of the leading lights of this school, but it must be recognized that the rank and file are distinctly behind those trained on the ordinary lines. Their planning is haphazard as a rule; it conforms to no accepted standard, and there is no rhyme or reason in it. While it is true that the constructive details are original, we prefer the more unimaginative construction which is efficient, rather than the attempts to abandon all precedent, without any effort to satisfy the conditions that brought the traditional forms of construction into being. We have seen a number of instances recently where the construction is novel, but apart from this it is downright bad and inefficient. The elevations too are self-conscious and fussy; there is no balance or reserve about them. The sole interest generally lies in the treatment of the materials, in which the practical craftsmanship which the school goes in for, leads them to delight in. This, it must be admitted, is a good thing, but it is not the most important. We do not say that it should be neglected, but there are many other matters that should be studied first. "Building without a builder" is a fine catch phrase, but you cannot have building without a builder. We are ready to admit that the exponents of this school are often not builders—their work is simply crude and amateurish; and sometimes we are inclined to think that they have no right to the title of architect.

DIFFICULTIES OF PRACTICE.*

By J. Archibald Lucas, F.S.I., A.R.I.B.A.

IN all occupations which are followed for the hope of reward, responsibility has to be borne with the many difficulties that beset its path. Law and medicine, however, the professions with which perhaps we as architects are mostly associated, seem especially fortunate in evading the difficulties that perplex our own calling. Lawyers can always shelter themselves behind counsel and experts—the latter in many cases being ourselves; while patients die, are buried, and the same medical man who has attended them certifies the cause of their death.

Not so with architects, who, when giving advice of a professional nature, are pinned religiously by their clients to the absolute context of such advice, which is generally asked for in writing. Then our patients, in the form of buildings, live long after our final certificates are given, in some cases (frequent perhaps) with strange undiscovered maladies.

The difficulty of practice at commencement is to get together a decent practice; and with the vast amount of competition, and increasing competition, this is exceedingly arduous work.

Another great difficulty is that created by

The Large Number of Pupils

now being launched to fill the ever-increasing ranks of junior assistants. On this account I consider generally that architects' assistants, junior and senior, are poorly paid in return for the cost of education and preparation for the work they are called upon to perform. It seems a great pity that we as a society cannot agree together that no architect or firm of architects shall take in his or their office more than two pupils at any one time. A minimum nett premium and term should be agreed upon, observed rigidly, and every effort made to standardize all the conditions under which pupils are to be received. It may be argued that country practitioners cannot secure the large premiums which some city architects not only demand but obtain. I venture to say, however, that things would right themselves in time by the country practitioner obtaining higher fees for his personal labours, and a better class of pupil.

Assistants.

Now, then, as to assistants. How very few really good ones can be found, and when they are engaged how long do they stop with us? Judging by the quantity of applications one receives, it seems that at present a large number of assistants are unemployed, but at the same time, I must admit that many of these are unemployable through being launched out of architects' offices immediately on the expiration of their articles, and without further experience.

Overtime and Private Work.

The questions of overtime and of assistants taking private work are difficulties which I will lightly touch upon. As to overtime, I am of opinion that, definite office hours being arranged on the engagement of an assistant and afterwards kept, hours of overtime should be paid for at an agreed rate. The question of assistants taking private work is one upon which we as a body should put down our foot firmly. It is manifestly unfair to the principal for the assistant to entertain such an idea in any form.

An Architect's Clerk

should be to the architect his remembrancer, diary, cash- and book-keeper; but how many have these qualifications? A good clerk with a thorough knowledge of shorthand and typewriting is the greatest help one can

have in any office. My endeavour for years has been to obtain the services of some clerk who has been engaged in the building trade, but I have been unsuccessful, as this class of clerk has generally no knowledge of keeping a diary or of shorthand. Having tried for years to obtain what I wanted, about three years ago I gave it up as a bad job.

Surveying Assistants

(and by this term I mean land and building surveyors, not designers) are of a varied class, as experience proves. Some in their work almost wish to take measurements of and plot to scale the blades of grass, while some go to the other extreme and are guilty of sins of omission which you are apt to find out as your buildings progress. Windows of adjoining owners, easements of water and drainage, and correct divisions of different properties are forgotten, and a multitude of other matters too numerous to mention crop up as the work proceeds.

Designers

(and by this I do not mean copyists) are perhaps the most difficult of all to obtain. I have had a few assistants in my time, but I have known only two who could design. Depend upon it the study of the principles of design is being neglected by pupils and young assistants. That this is the principal art of an architect is a fact that cannot be too strongly impressed upon all. Travel abroad is very fine for educational purposes, but before these trips are undertaken the general principles of design should be mastered. People nowadays crave after something new and original, something which no one else possesses. There is an immense field in architecture in this direction, and those pupils and young assistants who will take the trouble and pains to overcome the difficulty of mastering the principles of design and ornament will find themselves more than repaid in after years.

Specification Writing

is arduous work, but the enforcement of a specification in its literal sense is rarely, if ever, done. How difficult a good specification is to produce, and what an excellent document it is when properly prepared, no one but an architect can appreciate. The wily ways of builders and contractors to distort the meaning of words and sentences are well known to most of us, as well as the insidious suggestions of extra work in connection therewith.

Quantities.

On the question of quantities it seems to me very undesirable that architects should take out their own. By this I mean that the architect and quantity surveyor should be two entirely different men. The drudgery of quantity surveying—and it is nothing more or less than drudgery—cannot help the artistic side of an architect's practice. The difficulty of charging for the preparation of these quantities if debited to the client is overcome entirely if a quantity surveyor be employed. The detail into which some bills of quantities go is ridiculous, and in my opinion must greatly influence and increase the cost of building. It seems to me desirable for uniformity of bills of quantities in a district to be ensured. At Exeter or Plymouth if we architects arranged for one individual to take out our quantities for us, I feel sure there would not be that great difference in tendering which is sometimes observable.

Advertisements for Tenders.

The very general method of inviting tenders by newspaper advertisement is not one to be recommended. The difficulty at times of explaining why the lowest tender has not been accepted, the desire of the building owner to accept the lowest tender, the danger of good firms failing to estimate for work under conditions of public tendering, and the usual unsatisfactory ending if the lowest

tender is accepted and if he be an undesirable man—are all well known to us. It seems to me that a far more satisfactory condition of things is to invite three or four firms of good repute, whom you know from experience do excellent work; and further, to our clients it is far more advantageous to know and feel that the work is not being scamped, as it very often is under conditions whereby Tom, Dick and Harry get an opportunity to contract.

At the present time there are

Two Forms of Contract

in existence—that provided by the Institute and that by the Master-Builders' Association. As far as I read them, it is a matter of indifference which form is used, provided the architect is the sole arbitrator and umpire under the contract. Difficulties do and will arise, and it is far better for all parties that they should be settled quickly and finally and under the conditions named, with the architect as umpire, he having the full knowledge of all the facts. I have never yet consented to a builder signing a contract other than that the architect should be the sole arbitrator and umpire, and I strongly advise others to do the same thing. Nothing is more worrying in the course of a building than to have a builder constantly flaunting the arbitration clause in your face. I know of cases where this has been done over and over again.

Contractors and Builders.

People who work under architects I separate under two headings—contractors and builders. In the former term you can include anything; but in the latter a builder, to be worthy of the name, must be something more than a mere money-maker. Nothing is more difficult than to find really good builders.

Take the real country builder. He generally farms some land, keeps a cow or two, goes in for pony breeding, has a stone quarry, perhaps sells manures and feeding stuffs; then on top of this he runs a building business. His men at times help in the harvest, and his apprentices help on the land when required, with the result that a general slovenly style of work goes on.

Then take the town speculative builder—poor timber, mortar, flooring, plastering and everything of the cheapest and nastiest kind: in fact, one wants to act policeman and detective to this class of tradesman.

There is no more pleasant person to meet than the genuine old-fashioned builder.

Good Work with Speed.

The execution of work of good quality with speed is a great difficulty in our profession. We live fast nowadays; everybody is in a hurry. Impossible time-limits are placed in contracts for the completion of large structures, and ruinous penalties are threatened. With what result—very few buildings are ever finished within the specified time, and the impossible penalties are never inflicted. In my opinion the adoption of some sliding scale in the amount of the contract money would be the best solution of the difficulty, an equitable arrangement giving a date of completion within which the building could safely be finished; and if completed before, then for every day or week before the date of completion a sum to be added to the contract. It would be an incentive to a contractor to endeavour to earn this additional money, whereas now whatever happens he rarely finishes in time and pleads amongst other things delay in the supply of details, action of adjoining owners, alterations in the work, extras, and any excuse which may occur to him.

The Clerk of Works.

Up to the present I have, fortunately, not come across any dishonest clerk of works. On the contrary, I have employed several, and found them of absolute integrity. One feature I have noticed over and over again

* A paper read before the Devon and Exeter Architectural Society on January 5th, 1906.

THE HOTEL REINA CRISTINA, ALGECIRAS, SPAIN. T. E. COLLCUTT, F.R.I.B.A., ARCHITECT.

This hotel, where the delegates at the Morocco Congress are now staying, is interesting as the work of an English architect—Mr. T. E. Colcutt, F.R.I.B.A. It is situated on the shore of the Bay of Gibraltar, facing the Rock, and is built of local stone covered with plaster, the tiles on the roofs being of old Roman pattern (ridge and furrow) dipped and glazed, of the same character and colour as those used for the Savoy Hotel extension. The furnishing was carried out by Messrs. Maple & Co. (the complete selection being made by Mr. Colcutt) and the house baths and sanitary arrangements throughout by Messrs. Twyford. The plan of the hotel follows the arrangement general in Spain and Morocco, namely, with a central quadrangle or *patio* having a fountain in the middle, and wide-projecting roofs and arced to afford as much shade as possible. The columns to the *patio* are of Teba marble. The contractor was Mr. James Thomson (now manager of the hotel), who had been building in Tangier and Spain for eighteen years, and under his direction and that of Mr. Colcutt the work was carried out in the best manner by Spanish workmen, the joinery and marble work being equal to any obtainable in London. The building is treated more as a country house than as an ordinary hotel. The photograph reproduced above was taken soon after the building was completed. Since that date the shrubs and trees have grown considerably, and consequently the appearance is less bare than here shown. At Ronda, about 60 miles north-east of Algeciras, a similar hotel is to be built, and another at Mombassa (just north of Zanzibar), both from designs by Mr. Colcutt and his partner, Mr. Hamp.

is that a clerk of works cannot carry in his head the gist of the drawings, specification and quantities. He has constantly to refer when asked a question, and is never certain without a memory refresher. Always employ the clerk of works for whole time, and make him understand that if he has to work late or early in connection with any special job he must do so. The clerk of works was made for the architect, not the architect for the clerk of works. Many decent men I have had as clerks of works, but I prefer those who have been carpenters and joiners, as they seem more intelligent and far-seeing. Always make your clerk of works give up all drawings, details and papers in connection with the job at the completion of his engagement.

Foremen.

To have a foreman reliable and efficient in all respects on any building is a pleasure to the architect—one who can understand a plan and specification; who can look ahead and see what is wanted and arrange for its being on the job in good time; who can set out his work correctly and show those under him how to do their work. Builders find a difficulty in obtaining such a foreman, and it seems to me that as soon as they get him it is his ambition to become a clerk of works. Why, I cannot understand. A foreman can always obtain employment; a clerk of works cannot always do so. The trend of trades-unionism—namely, standardization—is to increase the difficulty in the production and the continuation of the supply of efficient foremen. I have known foremen who have been simply bullies, or, to use the workmen's definition, devil-drivers. On the other hand, one comes across quiet hardworking men who get much more work out of the mechanic in an unostentatious manner.

Extras and Omissions

constitute, in my opinion, the greatest difficulty in our profession. They cause more disputes than one can even dream of at the commencement of a contract. They are necessary evils, however, for no professional man living can foresee every detail and everything that is likely to occur above and below ground. Then, again, our clients alter and add as the work progresses, thinking in

their amiable way that all their little individual wishes are in the contract; but when the bill arrives it turns out to be an entirely different matter.

In practice watch the items which are omitted; sins of omission sometimes exceed in value sins of commission.

Payments to the Contractor.

One always feels a difficulty in arriving safely at the amount to which a contractor is entitled on a certificate, and very often I have doubted whether we are always fair to the contractor in our certificates—particularly in reference to the work done at the workshop. If you want work pushed forward, the builder must have the wherewithal; and it has always seemed to me that unless the contractor is paid as the job proceeds for that portion of the work going on at the workshop, you do not get stuff ready in time, as he knows he will not get payment until it is fixed on the job.

Difficulties of By-laws.

In every separate local authority one works under there would seem to be different building by-laws. The Model By-laws of the Local Government Board might do for some new country, as the Transvaal or Rhodesia, but to attempt to force the Model clauses on an old city like Exeter is absurd. Under our present by-laws not half the houses without 200 yds. of the exterior of our old city walls could be rebuilt. First, you must make all the sites square, then set back 12ft. from the centre of the road, then obtain the full air-space at the back. A more ridiculous proceeding than the adoption of these Model By-laws for the city of Exeter I never heard of. Those who adopted them could never have realized what was going to be their effect or the manner in which they were to work out.

The draughting of building by-laws on some common-sense code by architects without the aid of the Local Government Board is a work which all architectural societies should take up.

This question of by-laws is one of the greatest difficulties of our profession and a millstone around the neck of every landowner—without whom architects could not

live. Fortunately, in Exeter the revision of the present by-laws is now in hand.

Surveyors taking Private Work.

Some local authorities are lax, others strict, but the greatest nuisance to us as a profession is caused by the surveyors to those local authorities who are permitted to take private work. No local authority should permit its whole-time officers to take private work. Other architects practising in the district are placed at a great disadvantage, and perhaps are not treated altogether fairly and squarely, as some of us know to our cost. It behoves us that in all future appointments within the area of our society we should take the necessary steps to bring this question before the authority making the appointment.

Surveyors, men of high skill and position in the profession, who are appointed to large cities and centres are men whom it is a pleasure to meet and whose word is their bond. Not so with the rural and some urban districts. I have in my mind now a surveyor who indulges in speculative building, is an undertaker, furniture and pony dealer, and does a little architecture; and another who is a retired farmer but has taken on the charge of an urban district, collects the rates, is surveyor, water engineer and sanitary inspector. This difficulty could be met by our again acting together as a society and calling the attention of the authority making the appointment as to what the duties of their office should be.

Adjoining Owners.

Who does not become acquainted with adjoining owners during building operations, some fair, but the majority selfish? The troubles and annoyances one incurs from adjoining owners are very worrying. The difficulty of reconciling their demands with a due regard for your client's interest is enormous. Then at intervals these troublesome owners bring their solicitors on the scene, and that does not make matters easier!

Light and Air Difficulties.

The recent light and air decision in *Colls. v. Home and Colonial Stores* has swept away much difficulty in connection with this question, although it seems to me that some legislative measure might be introduced

referring all these disputes to arbitration with powers to the arbitrators and their umpire to decide whether the proposed building was an obstructive building or not; and if obstructive, whether it should or should not be allowed to proceed; and if the former, to what extent, and what measure of compensation should be paid. Most of these questions when they do get in the hands of the lawyers are generally referred back to our profession to settle, and it seems to me we might just as well come first as last.

Party-wall Questions.

I suppose there is more difficulty in party-wall questions than in light and air cases. As I understand it, party-walls are of three kinds—(a) that in which each party has an undivided moiety and interest as they exist at present; (b) ownership the same as (a) but, in addition to their present interest, rights to take further bearings; (c) that in which half the wall belongs to each party. It seems to me all difficulties in these matters could be got over if the party-wall clauses of the London Building Act, 1894, were extended to the provinces.

Easements.

As to easements generally, light and air, way and water, support—these are all more or less specialists' work, and although good text-books written by architects are in existence on light and air, no such text-books by surveyors who are brought in contact with questions of way, water and support appear to be available. The Architects' Law Reports are the latest attempt to furnish us with this information; but way, water and support appear to be a field for some energetic brother professional to bestir himself in, and so supply information on these heads.

Dilapidations and Valuations.

Difficulties of determining what are dilapidations under different forms of leases are most perplexing. So too are those vast differences in valuations—particularly valuations for compensation. The difficulty of determining the right value is one which is only overcome by experience. All the theory in the world cannot teach a man how to value property, although the prices other properties in the same neighbourhood have made may be to a certain extent a guide.

Thus, then, of some of the difficulties with which we have to deal in everyday practice as architects.

OUR PLATES.

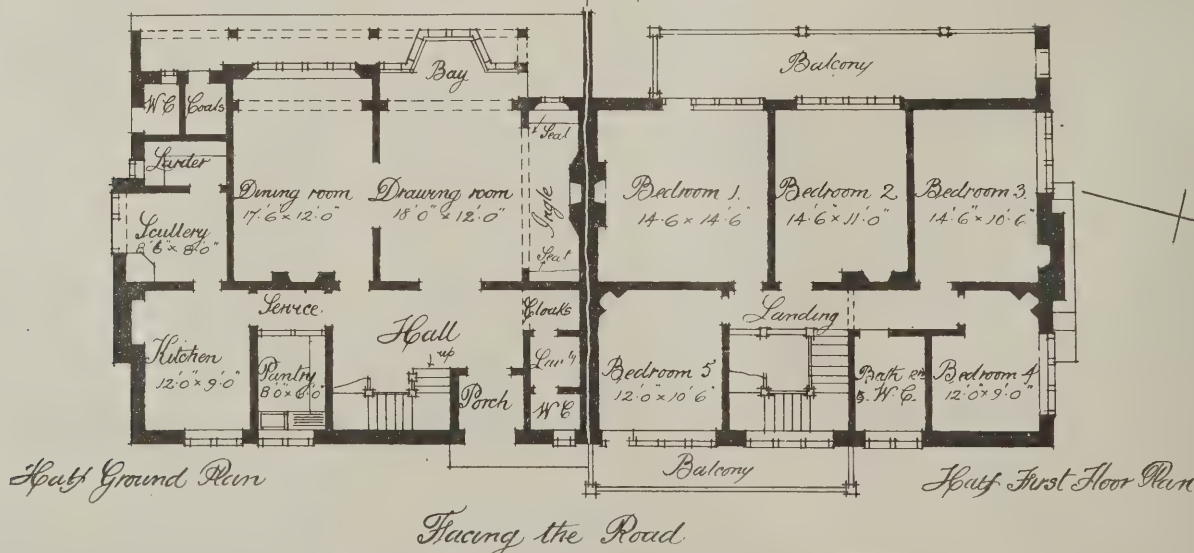

THE Tower Bridge Police Court and Station, illustrated in our centre plates this week, has been erected in Tooley Street, S.E., to replace the old police court in High Street, Scutawark, and the old Bermondsey Police Station. It provides principal and second courts and a large public waiting hall (these are panelled in fumed oak) together with the necessary offices, &c. The style adopted is a free treatment of English Renaissance. It is carried out in red brick and Portland stone. The court was opened in March last year, the architect being Mr. J. Dixon Butler, surveyor to the Metropolitan Police, and the contractors Messrs. John Mowlem & Co., Westminster. The photographs reproduced are by Messrs. S. B. Bolas & Co., 68, Oxford Street, W.

THE REGISTRATION BILL AND THE GENERAL ELECTION.

IN view of the reintroduction of the Society of Architects' Bill into Parliament early in the forthcoming session, the Council has circularized every Parliamentary candidate calling attention to the Bill, giving a brief synopsis of its scope and object, and inviting the candidate to record, by means of a prepaid post-card, his agreement or otherwise with the principle of a statutory qualification for architects, and his intention, if elected, of supporting the Bill. A letter has also been sent to the members of the Society asking them to support the council's action by writing to their local parliamentary candidates to a similar effect, and there are indications that this co-operative action is having good results. Many promises of support have been received.

Facing the Bristol Channel

HOUSES FOR THE NORE AVENUE ESTATE, PORTISHEAD, SOMERSETSHIRE. RODWAY AND DENING ARCHITECTS.

The estate for which these houses are designed overlooks the Bristol Channel, and is owned by Mr. George H. Perrin, of Nore Park, Portishead, and Mr. Thomas Hill, of Bristol. To meet the special desires of the clients the plan is arranged with hall, drawing-room and dining-room *en suite*, with folding doors; all the bedroom accommodation required being provided on the first floor. The scullery and minor offices are contained within the building, which arrangement avoids the objectionable and unsightly out-buildings so often seen in this class of property. The walls are to be of brickwork, rough-cast and lime-whited, with rough-cast chimney stacks and red pots. The external paintwork is to be finished a moss-green colour, and the roofs are to be covered with Broseley tiles in varying shades of brown. The interior woodwork generally will be finished cream; the staircase and ceiling joists of hall and landing will be in pitch-pine stained a dark green; and the paintwork in kitchen and offices green combed over a brown ground. The architects are Messrs. E. G. Rodway, A.R.I.B.A., and C. F. W. Denning, of Baldwin Street, Bristol.

Prizes and Studentships; Metalwork.

A MEETING of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the chair being occupied by the president, Mr. John Belcher, A.R.A.

Papers on metalwork were read by Messrs. John M. Swan, R.A., Montague Fordham, M.A., and Walter Gilbert.

Mr. John M. Swan, R.A., said he was so far penetrated by a profound reverence for the past that he felt we were but pigmies peeping through the legs of the Colossus of antiquity.

The Processes employed by the Ancients are so shrouded in mystery, and so difficult to verify, that we could not at this distance speak with absolute certainty or form a clear judgment upon them. All the varying changes of colour mentioned by the ancients were occasioned by the nature of the alloys. Many metals combine together when melted, and only remain in union within certain ranges of temperature by reason of the wide differences of their melting and solidifying points. In ancient bronze the proportions of tin mixed with brass or copper and of copper with silver seem to have been—copper 71 to 87 parts, tin 3 to 6 parts, lead 4 to 21 parts. There also traces of iron. With ourselves, in ordinary bronze, 96 copper and 4 of tin are generally used.

The Japanese are the Real Authorities for treatment of colour in metals to-day. They combine such extraordinary manipulative skill with artistic taste in carrying out any imaginative work. The superiority of French workmanship is doubtless due to their fine artistic instinct allied to their excellent art training. The Persian and Arabian metalwork with large plain surfaces of copper and brass might, treated in a bas-relief manner, be well adapted by ourselves for panel treatment for interior decoration. Describing the process of casting in

Cera Perduta,

which we get from Benvenuto Cellini, the author recalled that it is now about twenty years since the first *cera perduta* castings were made in this country. First, an ordinary piece mould or gelatine mould is made from the plaster mould. Then a wax casting is run from the mould, to which are attached the runners and gates for the flow of metal, and vents for air or gases. Afterwards the wax is cored, and an external covering-in mould covers the whole. It is then placed in a muffle or furnace, the wax melted out, and when the mould is dry the metal is passed in that replaces the wax model.

The Founders' Wax

is made of Gambia, Italian, or native beeswax and resin coloured with vegetable matter or vermilion. The colouring of the wax is important, as if some metallic pigment or earth colour were employed it would cause a residue in melting out that would destroy the casting. Speaking of the bronze statues of London, Mr. Swan said everybody must be struck with their uniform dull, heavy, monotonous black. It was a most unsatisfactory state of things for both public and artist. Was it not possible in metallurgy to discover an unchangeable alloy?

The author expressed his preference in many cases for

Gilded Statues

or monuments that would better resist the action of the atmosphere and have a more decorative effect. They might appear too garish at first, but London fog would soon tone the surface and take off the glare of new gilding. The "noble rust," the antique patina, is not naturally formed in the atmosphere of London, or our statues of malachite

and copper domes would be a delightful green. Gilded bronze can work in unison with black bronze, and aluminium may be looked after so that it does not become the uniform London black.

Mr. Montague Fordham said he was anxious to draw architects down into the workshops, which would have the double advantage of giving them more knowledge of the actual treatment of metal and of creating a closer bond between architect and craftsman. With this object he gave particulars of the tools used in the ordinary working of copper, bronze and iron, and followed with some notes on the nature of the metals and their proper treatment. Having discussed the technical side of his subject, he referred to the want of encouragement the craftsmen received from architects, who rarely entrust their metalwork to craftsmen, but deal with trade firms. Doubtless this was much less trouble.

A Trade Firm

employs a traveller, who is at the architect's beck and call, who will supply a design in any manner, adapt it for any metal, and cut his work down to any price. How was the designer-craftsman, the master-craftsman, who could turn out magnificent work under different conditions, to compete with such a system? The matter of the revival of metalwork rested largely with the architects. It was for them to say whether the small industries now growing slowly were to be allowed to flourish; if so, he felt great hope that the present century would become famous in all time for the distinction of its metalwork.

Mr. Walter Gilbert, whose paper was entitled "Romance in Metalwork," confessed his inability to show any fresh views of the art of metalwork, but he would endeavour to explain a little of that impulse which urged the artist to find expression in those methods and materials with which he felt in most sympathy, and which had the most influence in the development of the art.

Primarily it is Imagination,

or rather the consciousness of imagination—the ruling faculty in all art—which creates art. But real art is something more than this; it is imagination allied with skill and dexterity in the creation of beauty. Under all great art of the metal-worker, whether the thing to be done is great or small, there must always be the same working of the intellect, the same poetic feeling for the ideal in story, the same tenderness for material. As for the future, let us not hastily condemn any struggle for new treatment. What the artist requires is not too arbitrary an assertion on the part of the architect of what is good or bad, for which often an architect, owing to present-day methods of training, is not too well qualified to judge, but a stimulus to thought and energy for the artist—that the architect may gather round him a band of men working eagerly in close co-operation with him for the glorification of his buildings and an enhancement of his fame.

Mr. G. Hubbard proposed a vote of thanks, which was seconded by Mr. Harrison Townsend. The president also took part in the discussion.

Prizes and Studentships.

The deed of award of the prizes and studentships for 1905-6 was then announced as follows:—

Essay Medal and 25 Guineas—subject, The biography of a British architect (deceased) practising in the nineteenth century: 6 essays submitted. Winner: Mr. W. H. Godfrey, of London ("Terra Incognita"). Certificates of Hon. Mention: Mr. Martin Shaw Briggs, A.R.I.B.A. ("Gargoyle"), and Mr. Albert E. Bullock, of Chiswick ("Shingalee").

Measured Drawings Silver Medal and 10 Guineas: 15 sets of drawings submitted.

Winners: (Bracketted equal) Mr. Albert E. Poley, of Hampton Hill ("A.D. 1690") for drawings of Hampton Court Palace, and Mr. George John Coombes, of Bournemouth ("Sigillo Ecclesie Trinitatis d. Totham"), for drawings of Christchurch Priory, Hants. Certificate of Hon. Mention: Mr. Percy W. Lovell, of Highgate, N. ("San Marco") for drawings of Santa Maria dei Miracoli, Venice.

Soane Medallion and £100—subject, The realization of the ideal mansion described in Bacon's essay "Of Building": 10 designs submitted. Winner: Mr. Walter S. George, of Ashton-under-Lyne ("John Thorpe"). Certificate of Hon. Mention: Mr. Robert Atkinson, of Nottingham ("White Lion").

Owen Jones Studentship; Certificate and £100—5 sets of drawings submitted. Winner: Mr. Charles Gascoyne. Certificates of Hon. Mention and 5 guineas each: Mr. W. J. Davies, Mr. Arthur D. Nicholson and Mr. A. R. H. Jackson.

Pugin Studentship; Silver Medal and £40—12 sets of drawings submitted. Winner: Mr. G. Drysdale. Certificate of Hon. Mention: Mr. Jordan Green.

Dwin Bursary; Silver Medal and £65—5 sets of drawings submitted. Winner: Mr. H. I. Triggs, of London, W.

Tite Prize; Certificate and £30—subject, An open-air swimming bath with an arcaded or colonnaded enclosure: 21 designs submitted. Winner: Mr. Alec George Horsnell, of Chelmsford ("Dolphin" on white strainers). Medal of Merit: Mr. Charles Bulwer Pearson, of Lancaster ("Ellipse"). Certificate of Hon. Mention: Mr. C. L. Wright, of West Kensington ("Dorian").

Arthur Cates Prize; £42—One set of drawings submitted, by Mr. John H. Markham, of London, S.W.

Grissell Gold Medal and 10 Guineas—subject, A stone skew bridge: 6 designs submitted. Winner: Mr. George Nott, of Leicester ("Utile Dulci").

Ashpitel Prize awarded to the Student who distinguishes himself most highly in any Final Examination held during the year.—Winner: Mr. John H. Markham.

Special Prize of Books value £10, for merit displayed at Special Examination in November: Mr. A. R. Myers.

Mr. R. S. Lorimer, A.R.S.A., has designed a Roman Catholic Church for Morningside, Edinburgh. The plan of the church will be a Latin cross, with shallow sanctuary and transept. The interior will be whitewashed and the high altar is to be composed of rough masonry. A rood of great size will hang in the sanctuary arch.

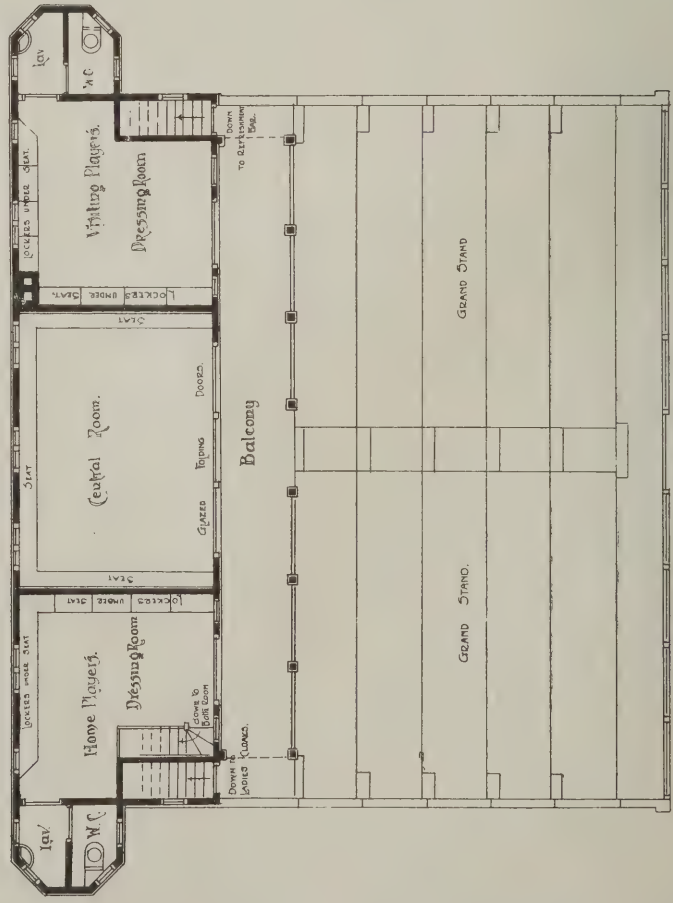

The General Electric Co., Ltd., held its sixteenth annual dinner in the Grand Hall of the Criterion Restaurant on Saturday last. About 350 persons attended. After the Royal and Imperial toasts had been given by the chairman, Mr. H. Hirst (one of the three managing directors of the company), Col. R. E. Crompton, C.B., responding to the toast of the Imperial forces, Mr. Hirst proposed "The Staff." He referred to the great extension of the business of the company which had taken place, rendering necessary the enlargement of their works and offices. Mr. R. Dumas, chief engineer to the company, replied, giving the toast of "The Directors," coupled with the name of Mr. H. Bevis, the managing director at Birmingham, who responded. Mr. Max Byng then proposed "The Visitors," which was replied to by the Hon. Walter James, Agent-General for Western Australia, Professor Ayrton and Sir Richard Awdry. After the dinner a concert was given, and thus a highly successful evening was concluded.

Front Elevation.

Back Elevation.

This design was selected from nine sets of drawings submitted in competition by local architects. The new pavilion is to take the place of an old one which has served for many years. The lower portion will be built of local common bricks and the upper portion of half-timbering and rough-cast. The eaves cornice will be of wood and the roof covered with red Broseley tiles. The eaves cornice will be matchboarded inside and painted green. The grand stand will be built of concrete on brick walls. The half-timbering will be painted green, and the balcony and eaves will be painted white, the rough-cast being also finished white. The pavilion will stand on one of the finest cricket and athletic grounds in the country.

MANCHESTER NOTES.

(By our Own Correspondent.)

THE half-yearly report of the Manchester, Salford and District Building Trades Employers' Association contains nothing of special interest. A small addition to the membership, cordial relations with the operatives, partial success in the effort to establish a conciliation board, are satisfactory if not striking features, and it is good to hear that although trade "is still undoubtedly depressed there are not wanting signs of impending improvement and the approach of more prosperous years." The more hopeful tone in the trade finds justification in the welcome reports of contracts coming out. Messrs. C. Heathcote & Sons have designed new business premises in Deansgate, and for a good site at the upper end of King Street; Mr. Rhodes Calvert, F.R.I.B.A., has in hand a new warehouse in High Street; Mr. Beaumont new shops and offices in Market Street; Messrs. W. & G. Higginbottom a large warehouse in Chepstow Street; and Mr. Willoughby new shops and offices in Deansgate. Messrs. W. Brown & Sons, of Salford, have secured the contract for a new warehouse in Whitworth Street, to the designs of Mr. J. Dent Harker, A.R.I.B.A. This contract amounts to about £35,000, and the work is to be completed within six months. As the building is of terra-cotta above a granite base, Messrs. Brown & Sons have shown considerable pluck in undertaking the job in the time.

A New Restaurant.

The new high-class State Restaurant of the Ceylon Café Co., designed by Messrs. W. Aubrey Thomas & Co., of Liverpool, has just been opened, and, like the premises of the company in Market Street and Mr. Beaumont's new building, is faced with Doulton ware. This forms a glaring contrast to the adjoining sooty fronts, and gives something of the appearance of a new toy in a dustheap. The interior decoration of the State Restaurant is beyond question the most beautiful example of Sicilian marble work to be found in Manchester, and the gold mosaic by which it is relieved is exceedingly effective.

Timber.

From Liverpool there comes a pathetic lament that while the timber imports of that port have decreased the Manchester returns reveal a steady increase. The Manchester imports of timber are so striking that the figures are worth giving. Commencing with 93,810 tons in 1895, the yearly returns show consistent increases until for 1905 the total will fall little short of 400,000 tons. Manchester, in fact, is the fifth largest centre, being only excelled by London, Cardiff, Hull and, for the moment, Liverpool. The principal importers, whose storage grounds are all in Trafford Park, are Messrs. Joseph Griggs & Co., Ltd.; The Imperial Lumber Co., Ltd.; Messrs. Illingworth, Ingham & Co., Ltd.; Messrs. H. Newsum, Sons & Co., Ltd.; and Messrs. J. W. Southern & Sons.

The bankers' clearing returns speak eloquently of the wonderful effect of the Ship Canal upon the trade of the district. The total for 1905 is £263,586,300, an increase of £15,000,000 upon 1904 and £60,000,000 above the Liverpool returns.

The Unemployed.

The proposal of the Manchester Distress Committee to purchase an estate twelve miles from the city upon which to find work for the unemployed has been referred back for further consideration. It was pointed out that the proposed colony was only an experiment, and that for that purpose it would be sufficient to rent ground; also that upon the adjoining Chat Moss estate of the Corporation there are 160 acres still undeveloped. Strong opposition is also being manifested to the proposal of the City Council to spend about £40,000 in the erection of baths and

washhouses in Bradford (Manchester) and £19,000 in the completion and equipment of the baths in High Street. The latter baths are situated in a good middle-class district, and the sum now asked for is extra to the original estimate. It is contended that public money should not be spent in the provision of a luxurious establishment in a district where almost every house contains a bath. A strong association of ratepayers whose object is to keep down the rates seems likely to be successful in preventing many Corporation extravagancies, at the same time furnishing a much-needed protest against reckless municipal collectivism.

NOTES ON COMPETITIONS.

Kingston Baths.

A rather stormy discussion took place at last week's meeting of the Kingstown (Dublin) Urban Council in respect of the recommendation of a committee that an open competition for designs for new baths to be constructed at a cost of £6,000 should be held, with first and second premiums of £54 and £25 respectively. Ultimately the committee's recommendation was rejected in favour of a proposal to employ a local architect to carry out the work.

Baptist Church and Schools at Walthamstow and Ilford.

The design of Messrs. W. D. Church & Son for a Baptist church and schools to be erected at Walthamstow at a cost of £7,500 has been selected by the committee on the recommendation of their assessor. Messrs. Church's design in a limited competition for Baptist Sunday schools at Ilford has also been placed first and accepted, the work to be carried out by Messrs. F. & A. Willmott, contractors, of Ilford.

Alexander Thomson Travelling Studentships.

The first prize (value £60) has been gained by Mr. James Whitelaw, of Uddingston, Glasgow, and the second (£20) by Mr. F. M. Craik, of Glasgow.

Wrexham Schools.

The Education Committee of the borough of Wrexham has just issued the conditions of competition and instructions to architects for new schools to be erected within the borough. It is a relief, after a somewhat lengthy run of condemnation of other conditions, to be able to announce at last that here are some which, on the whole, may be accepted as satisfactory—so satisfactory, indeed, that one would hesitate to place any reserve upon the praise to which they are entitled were it not that the old-fashioned expedient of identifying the designs with a motto is to be adopted, and that the name of the assessor is not given. The former objection is minimized by the fact that the motto is to appear only on the back of the plans; the assessor is mentioned as "competent" and a F.R.I.B.A., and these circumstances, in conjunction with the quality of the conditions, lead one to anticipate an award which shall be beyond question.

The schools are to accommodate 350 boys, 350 girls and 300 infants. The cost at £12 10s. per head works out at a total of £12,500, which is to cover the usual requirements and is exclusive of architects' and quantity surveyors' fees and clerk of works' salary. The premiums are £50 and £30 respectively, the first to merge in the commission of 5 per cent. on the amount of the accepted contract. The drawings are to consist only of such plans as are required by the Board of Education. No perspective view will be required or admitted. Specially praiseworthy is the plan of site and levels which accompanies the conditions. The levels are marked every foot, each way, and

a small block plan is appended sufficient to enable an intending visitor to find and locate the site without trouble. Also worthy of note is the following clause: "The committee are most anxious not to be extravagant in the school building. The general character should be simple and inexpensive, and express the purpose of the building, which should depend for external effect not upon ornamentation but upon good proportion and satisfactory lines. Eaves unduly projecting over the windows should be avoided, as they interfere with the most valuable light—that admitted by the top of the windows." This is excellent alike as general advice and for the insistence of the principle that design should depend upon good proportion and satisfactory lines, a principle universally acknowledged by all worthy the name of architect, but so constantly forgotten by many appearing under the name of competitor.

The conditions are issued free from the requirement of a deposit. This is a course the universal adoption of which has been sought by all competition reformers. It would be interesting to know later how the promoters have been affected by it, whether the number of applications has exceeded the average in similar competitions where a deposit has had to be made, considered in connection with the number of designs submitted. Such information would be most useful in determining the lines of action for the promotion of the principle of free conditions.

Altogether one cannot help regretting that Wrexham is in Wales, as far as Londoners are concerned, and that the proposed buildings are not of such a size as to make it worth the while of those in a more extended radius to take part.

Greenwich Branch Library.

It is due to the promoters of this branch library competition to exonerate them from all blame in connection with the returning, before the award had been made, of cheques paid by competitors as deposits for conditions. The fears expressed that something had gone wrong were, if excusable, unfounded. It has been ascertained that the owners' names were not obtained from the reports which accompanied the designs, and it has been pointed out that signatures upon cheques in conjunction with letters of application for conditions are sufficient in ordinary circumstances to ensure their safe return. It will be amusing to know, however, how this action of a too zealous official will be viewed when the list is prepared of applicants (if any) who did not submit *bona-fide* designs. It would have been also amusing to have witnessed the smiles of such applicants upon the return of cheques to which they had bidden a long farewell.

The most Economical Plan for Tenement Buildings, said Mr. W. P. Rylatt at the last meeting of the Leeds and Yorkshire Architectural Society (when he read a paper on "The Better Housing of the Artizan Population") was a parallelogram two rooms deep and with a common staircase, everything as far as possible being fire-resisting. All staircases, landings and passages should be reduced to a minimum. To bring a little brightness into the lives of the tenants the buildings might be planned around a paved court or quadrangle opening into a street by one or more archways and laid out with flower beds. This court might be overlooked from balconies on each floor. In providing dwellings for the artizan class private enterprise had signally failed. It had created acres and acres of fresh jerry-built property in the suburbs, which probably in a few years would fall into a condition almost as bad as that of the wretched dwellings now being cleared out of slums.

THE PLANNING OF CREMATORIA AND COLUMBARIA.

A PAPER on this subject was read by Mr. Albert C. Freeman before the Society of Architects last Thursday.

Mr. Freeman having recently contributed an article to our columns on the same subject (see our issue for September 6th last), in which similar particulars were given, we need not here repeat them, but the following are some extracts from his paper which will be found additional to the matter already published in our pages:—

Golder's Green Crematorium.

This building, which was opened in November, 1902, is the property of the Cremation Society of England. It is designed in the Northern Italian style, and may be said to be strict in treatment, depending on its breadth and proportion rather than upon ornament. Messrs. Ernest George and Yeates were the architects. Provision is made of a chapel 70ft. long (including gallery) and 25ft. wide, with a waiting-room and vestry arranged beneath the gallery. The incinerating chamber adjoins the chapel; it is 62ft. long and 40ft. wide, with provision for four furnaces, two of which are at present erected. The internal walls of the chapel are panelled to the height of the doors, above which the arched brick walls carry an open timbered roof. The columbarium is about 22ft. square; it is a tower-like building with four storeys, having provision for the reception of 1,700 urns. It is proposed at some future date to connect this building and the chapel with cloisters.

Manchester Crematorium.

This crematorium comprises a hall or chapel about 50ft. long and 25ft. wide. Colonnades for the reception of urns are arranged on each side. On the inside wall of the hall niches are arranged for urns. The incinerating chamber, which is at the rear, has accommodation for two furnaces.

Liverpool Crematorium.

This building is an excellent example of a combined crematorium and columbarium. On the ground floor are arranged the chapel, waiting-room and incinerating chamber; while under the chapel, and with direct access from it, is provided a columbarium having three well-lighted corridors, on either side of which are arranged niches for storing urns: some of these provide for one and some for three.

Leicester Crematorium.

This building stands in the Gilroes Cemetery, Leicester. It is designed in a late Gothic style and comprises two chapels about 24ft. wide and 43ft. long, each having a chancel at the rear 17ft. by 17ft. 6ins. One of these chapels is intended for inhumation services, and the other, which is for cremation, has an oak catafalque. At the rear of the chapel is planned the incinerating chamber, which is 43ft. long and 23ft. wide. Cloisters are arranged at the front and side of the building. It is proposed at some future date to form niches for urns in the recessed spaces on the walls of the cloisters. At this crematorium also mortuaries, waiting-rooms and several other offices are provided.

Hull Crematorium.

This crematorium is built of red bricks externally, with artificial stone dressings. It is designed in the early Perpendicular style, freely treated. It comprises a chapel 24ft. square and an incinerating chamber 20ft. wide and 24ft. long. The catafalque is constructed of stone and draped with velvet.

Sheffield Crematorium.

This building, which was erected in 1904, forms an annexe to the existing chapel of the City Road cemetery. The crematorium is 36ft. square inside, and has accommodation for two furnaces, only one of which is installed at present. The building, which is of fire-resisting construction is roofed with an

octagonal dome of stone ribs and concrete, covered with roofing slabs of artificial stone. It terminates in a stone lantern, which is designed to provide both light and ventilation, and also serves to enclose the furnace shaft.

City of London Crematorium, Ilford.

This building is planned with a chapel 24ft. wide and 25ft. long. The cremating chamber is 37ft. wide and 30ft. long, with provision for two furnaces, only one of which is at present erected. The original plan has been improved, a waiting-room having been added and access from the chapel to the incinerating chamber arranged through a small lobby, instead of passing through the tower at the side of the chimney shaft. The lower floor of the cremating chamber is reached by means of a stone staircase. In this building a fuel store is provided at the ground-floor level, in addition to the one in the basement. The arrangements for a pilot fire in the chimney are also provided at this floor level. The opening into the incinerating chamber, at the head of the catafalque, is designed in terra-cotta, and fitted with a pair of iron doors, which are covered with curtains.

Geneva Crematorium.

This scheme when completed will comprise one of the finest examples of a crematorium and columbarium. The crematorium, which is designed in the Byzantine style, is the only portion at present completed. It provides on the ground floor a chapel, with the incinerating chamber under. The catafalque is of an unusual design. The coffin is placed underneath it, resting upon a lift, which is automatically lowered when the committal sentence in the service is reached. It is proposed at some future date to erect colonnades branching right and left of the crematorium, with provision for urns. The general arrangement of this building is to be found in France and Germany.

Mount Royal Crematorium, Montreal.

This building provides a conservatory or waiting hall 82ft. long and 40ft. 6ins. wide, constructed principally of glass and iron. The floor is laid with coloured marbles and banked with plants, forming a magnificent entrance hall. Leading from the conservatory, the cremating hall is reached, 56ft. long and 20ft. 6ins. wide; it is constructed with a groined stone roof, the floor, like that of the conservatory, being laid with marble, and the walls lined with a marble dado. Four doorways are provided for passing the coffins into the incinerating chamber, each being fitted with an elaborate bronze door. The incinerating chamber, which has provision for two furnaces, is 56ft. long and 20ft. long. At the rear of the conservatory, and with access from same, three large vaults or columbaria are provided for the reception of urns.

The Earl Crematorium, Troy, New York.

This building, which is designed in the Romanesque style, is 136ft. long and 70ft. wide. The chapel is 40ft. long and 26ft. wide, with a chancel 26ft. by 16ft. It is a model of architectural skill, and its furnishings throughout are in good taste. The reception-room, which is 24ft. by 20ft., is most artistically decorated. The walls are of Siena marble blocks, laid in 12in. courses, surmounted by a carved moulded cornice of the same material, and supported by a wainscotting of pink African marble 42ins. high. All the doors and windows are covered with elliptical arches of pink African marble, and in the angles are figures holding laurel leaves and flowers, executed in marble mosaic. These arches are borne upon seventeen columns, each 5ft. 9ins. high and of 11ins. diameter. The tower at the south end is 45ft. from the chapel, with which it is connected by a loggia of three massive granite arches. It is 90ft. high and 18ft. square at the base.

Crematorium and Columbarium, San Francisco.

The crematorium here contains a chapel which occupies one-half of the first floor and has seating accommodation for 140. It is fitted with all the necessities for conducting a funeral service. Beneath the chapel on the ground floor are four rooms—reception-room, preparation room, incinerating room and temporary urn room. The coffin is received in the reception-room and afterwards placed upon a lift and raised to the chapel above, being noiselessly lowered to the incinerating chamber after the service. This latter is supplied with two furnaces. Around three sides of the chamber is constructed a gallery, with seating accommodation for those relatives or friends who wish to witness the introduction of the coffin into the furnace. The columbarium, which is situated about 650ft. from the crematorium, has provision on the ground floor for upwards of 1,700 niches, varying in capacity from two to twenty urns. The first floor is a duplicate of the ground floor, except that the quadrants are lighted at the top instead of at the sides, and contains 1,600 niches. The second floor is similar to the ground floor, but the quadrants and wings are omitted; provision is made for 700 niches on this floor.

Notes.

The chapel or hall should be planned with a minimum floor space of 1,200ft. super.

The catafalque, or table upon which the coffin is placed during the service, should be planned to stand with its head abutting the wall of the incinerating chamber. When the latter is planned underneath the chapel, then the catafalque should be situated so that when the coffin is lowered it will be deposited near the front of the furnace. The catafalque in general use is about 12ft. long, 3ft. 8ins. wide and 4ft. high; the top is fitted with an apparatus worked by means of an endless chain, which conveys the coffin to the carriage arranged to run on lines inside the cremating chamber.

The opening in the wall of the incinerating chamber should be the full width of the catafalque, and about 2ft. 9ins. high; it is fitted with a pair of iron doors and should be covered with curtains.

When planned for a single furnace the incinerating chamber should have a minimum width of 20ft. and a minimum length of 25ft. This will be sufficiently large for either a "Simon" or "Toisoul-Radet" furnace; when two or more furnaces are provided, then the superficial area will be increased in proportion.

Furnaces.

The types of furnace principally in use in this country are that patented by Messrs. Simon, Ltd., of Manchester, which is heated by coal and coke; and that of Messrs. Toisoul, Radet & Co., of Paris, which is heated by coal-gas.

When a "Simon's" furnace is installed a basement about 6ft. 6ins. high is required to receive the lower portion of the apparatus. It is advisable to form an opening in the floor clear of the same. By this means the expansion and contraction which takes place will not affect the structure. The heating of this furnace is generally commenced in the lower part, and the stoking continued from the feed-hole at the ground-floor level.

When a "Toisoul-Radet's" furnace is installed no basement is required, the only provision necessary being a small pit at the rear in addition to the excavation for the lower part of the furnace, flues, &c.

The furnace should in all cases be planned to stand 10ft. from the wall of the chapel.

The Chimney Shaft

should be planned as close to the cremating furnace as possible. At the base it should be at least 2ft. square inside, and be carried up to a minimum height of 60ft. The chimneys at Hull and Ilford are

70ft., while that at Birmingham is 80ft. Mr. Freeman, however, said he had found, when these furnaces were at work, that the dampers were rarely withdrawn to their full extent, and therefore he had arrived at the conclusion that the height was excessive. If an opening of about 21t. wide by 3ft. high, fitted with iron doors, were formed at the base of the shaft it would be found to meet all the requirements for lighting a small fire and causing a draught.

Cost.

The cost of a crematorium will depend upon the number of furnaces installed, the accommodation provided for the reception of urns, and the general style and decoration of the building. The Woking Crematorium cost £5,022; the Leicester Crematorium, with chapel for inhumation service and the various other buildings, £13,830; the Birmingham Crematorium, £5,000; Liverpool Crematorium, £8,000; Ilford, £7,000; while the crematorium at Hull cost only £2,700.

THE ARCHITECTURAL ASSOCIATION.

Mr. Lynn Jenkins on Sculpture.

A MEETING of the Architectural Association was held on Friday evening at 18, Tufton Street, Westminster, the chair being occupied by Mr. Louis Ambler, F.R.I.B.A., vice-president.

The following new members were elected:—Messrs. G. W. Horne, R. Griffin, R. Mountford Piggott, E. P. Cooper, C. H. Rose and E. J. Cartaar. Mr. A. Dicken was reinstated.

The following further donations to the Building Fund were announced:—

	£	s.	d.
J. S. Gibson	-	-	1 1 0
T. H. Russell	-	-	1 1 0
C. H. F. Comyn	-	-	1 0 0

W. Henry White	-	-	0 10 6
T. C. Yates	-	-	0 10 6

Mr. F. Lynn Jenkins then read a paper on the consideration of sculpture by architects.

The Rise and Fall of Sculpture.

In studying the history of the earliest ages of civilized mankind he said we seldom, if ever, found the art of sculpture employed without a direct and useful purpose; the isolated statue, unless it portrayed a hero or an idol to be worshipped, being practically unknown; so that we might infer that sculptured figure or symbolic ornament, whether carved in wood or stone, marble or granite, or cast in metal, was designed and executed solely to convey an intention which could not be well expressed by any other means.

It was not until a later age that sculpture degenerated into being, broadly speaking, a means of ostentatious display of wealth and exuberant luxury, ceasing to be an integral part of the *raison d'être* of the building it adorned.

A time came when the demands of beauty claimed equal, and afterwards greater, rank than those of pure utility, and whereas in the latter case the artist was limited within set bounds, in the former the restrictions were less apparent, depending on the individual taste of the designer.

Hence the architecture of the Egyptian might be taken as one example of a period when sculpture was used solely because it was the only means the builder had of expressing his full intention, and, on the other hand, that of the Greeks as illustrative of the perfect, restrained and refined consummation of the aims of the utilitarian as well as the lover of beauty and style.

The downgrade began with the decline of the Greeks. In the ages that followed sculpture and ornament were applied lavishly, with no logical reason as regards utility of purpose, with no cultured simplicity of style, and with little or no individuality or fitness; though it was true that the Renaissance for a time stimulated a noble order of things, that while it lasted a glimpse of the vital secret of the Greeks enabled the artists of that period to attain a high standard of beauty, in which we found purity of motive, marked individuality and yet another fresh characteristic; for while the Greeks achieved an almost godlike perfection it was a pagan, superhumanly cold perfection, whereas the artists of the Renaissance, though attaining to a lower standard of success, infused a larger proportion of human nature into their productions, a sympathy with mankind born of the warmer culture of a romantic and passionate people. For this reason when the inevitable reaction again occurred the art did not sink so low, because men were striving with ideals they better understood, in which the human element responded and beckoned them on. Another factor, too, was the Gothic movement in Western Europe.

Architect-Sculptors and Sculptor-Architects.

Mr. Jenkins said he had often thought that one of the chief reasons why the sculpture and ornament of the Greeks and Romans, of the Renaissance, and of the Gothic buildings were so perfectly in accord with the architecture was because the architects were the sculptors and the sculptors the architects. Nowadays, unfortunately, we were specialists, and, as a rule, the architect knew little of the practical side of sculpture and the sculptor even less of that of architecture.

The present age, however, was one when many thoughtful, enthusiastic and inventive sculptors would gladly assist in the development of a characteristic and personal style of ornament if architects could but express what they themselves really wanted. So long as ornament was handed to business firms of architectural carvers, with private museums of stock casts as their sole inspiration—not to get new ideas from, but from which to select and arrange—just so long would the neglect of this important part of the detail of many an otherwise good building appear to the historian of our time to have been unwarrantable and inexplicable in architects showing otherwise so much individuality, forethought and enthusiasm.

Some sculptors had felt the want of individuality in carved detail so much that they had evolved their own ornament. Amongst these Alfred Gilbert, R.A., and George Frampton, R.A., were notable instances.

Life Study.

Mr. Jenkins emphasized the great merits to be derived from the close study of the human figure, to which the Greeks had given pre-eminent attention. He said he felt sure that if students were given opportunities to draw and model from life to a much greater extent than at present, and were logically trained to regard this particular study as a means to a definite end in somewhat the same manner as the Greeks must have done, then we should soon find an appreciable advance made towards the higher ideals of artistic architecture.

The Bane of the "Orders."

Students in architecture spent considerable time wading through a long course of study of the "Orders," but Mr. Jenkins doubted if 1 per cent. of such students ever took the trouble to make a complete scale drawing of the entire elevation of which the column, architrave and cornice were but details. How, then, could they possibly train themselves by such means to analyse and appreciate the great principles which guided the Greeks in designing these masterpieces?

The Mistake of Making Sculpture an Afterthought.

Architects were apt to consider sculpture as an afterthought, to be added to the design if funds permitted, or omitted if they did not. The average architect did not regard sculpture as an integral part of his conception from the very outset, the omission of which would inevitably mar the entire design, which would be equally impaired by any afterthought or addition.

There was also a tendency to be too closely bound by tradition in the application of sculpture or ornament to just those parts of a façade which had usually been so filled. Possibly custom had labelled as a general rule the most fitting parts to be decorated, but it did not necessarily follow that under new individual conditions they should still be the most appropriate.

Another Common Fault

was the over-lavish distribution of small frittering ornamental detail, which sometimes completely destroyed the simple dignity of an otherwise good architectural design. It would have been far better in some cases if ornament had been altogether omitted, or at most massed at one or two essential points. Such buildings reminded one of men whose bodies were tattooed all over with designs having no relation whatever to the form thus masked. One might admire the fine detail and workmanship of the tattooed design and yet heartily wish it were not there.

The Proper Use of Sculptured Relief

had always been one of the most difficult problems both to architects and sculptors. Either it was too high and the local colour was too marked, or the reverse was the case. It was to be borne in mind that there were two methods of obtaining strong values in relief. One was by having a high projection and making the sections rather round; while the same effect could be secured with much less actual projection by treating the planes very simply and making the edges sharp and square. It was for the architect to instruct the sculptor as to which method he considered most applicable to his design.

Collaboration.

A great deal had been written and there had been endless discussion on the subject of collaboration between architects and sculptors. Mr. Jenkins, however, said he failed to see how it was possible, in existing circumstances, for true collaboration to occur; and although in a few isolated instances a great measure of success had been attained, it had been more the result of accident than otherwise. Before collaboration could be thorough there must be a common ground of mutual understanding between the sculptor and architect, which certainly did not exist at present.

In this connection Mr. Jenkins recommended the use of

Scale Models of the Architect's Buildings.

He was convinced that in all serious undertakings where sculpture was to be employed as a part of the architectural scheme, success would in the end be more surely attained by the architect's careful consideration at an early stage of the designing of a scale model of his conception. In this model he should express his intention as to the general planes and masses, the proportionate depths and projections of mouldings and reveals, and he himself should decide by means of suggestive bits of clay exactly the disposition, pattern and projection, silhouette and mass of the parts he wished the sculptor to enrich.

In conclusion, Mr. Jenkins said it would be an excellent thing if students in sculpture and in architecture were taught side by side in classes, where the decoration of architecture with sculpture should be the subject for special consideration. Architectural models should be made by the joint efforts

of one sculptor and one architect, in the designing, modelling and decorating of which both students would become intimate with the principal laws governing each branch of the art.

Discussion.

Mr. T. Stirling Lee, proposing a vote of thanks, said that many buildings, especially in London, would be much more dignified without their ornament. The architect and sculptor must work together, and must look look at things in the same way.

Mr. H. H. Statham seconded. Of sculpture on buildings he said there were two stand-points to consider—whether the sculpture was to be put in a frame, or made a part of the building. The architect should have some idea as to what he wished the sculptor to do, and should decide whether he wished the sculpture to be an architectural ornament or, as sculpture, to be studied close at hand.

Mr. H. H. Stannus referred to the collaboration which existed between architects and sculptors in France.

Mr. Henry T. Hare said they had only to look at the monuments of London to see how much the sculptors failed in their architectural accessories.

Mr. M. Garbutt and the chairman also spoke, and Mr. Lynn Jenkins briefly replied.

Law Cases.

Converting One Dwelling House into Two.

—At Stratford recently the Bench gave their decision in a case in which Mr. Ernest F. Selby, a builder, of Leytonstone, was summoned by the Wanstead Urban District Council for converting into more than one dwelling-house a building known as Canfield, Herman Hill, originally constructed as one dwelling-house, and for having refused to submit plans and sections of every floor of such building, as required by section 90 of the council's by-laws. At the hearing of the case it was contended for the defendant that the by-law was bad because it had not yet been sanctioned by the Local Government Board, and there was uncertainty as to the meaning of it. The alterations carried out did not, it was urged, involve any alteration to the exterior of the house, the only thing done being the erection of a partition inside. —The Bench found that by-law 90 was not bad for uncertainty, and as a fact the defendant converted the building, originally constructed as one dwelling-house, into two dwelling-houses. The by-law also applied to a new building as defined by section 159 of the Public Health Act of 1875, and the Bench were of opinion that the defendant had infringed that section. The attention of the Court ought, however, to have been drawn to the case of *Hall and others v. Eastbourne Mayor, &c.* A fine of 40s. and 4s. costs was imposed. The Bench agreed to state a case.

A Travelling Crane not a Building.—At the South-Western Police Court recently Messrs. Anderson & Sons, builders and contractors, of Putney, were summoned by the London County Council for erecting an iron structure at the rear of their premises without the sanction of the Council. The question in dispute was whether the structure—a motor crane worked by electricity with a longitude run of about 120ft.—was a building within the meaning of the Act. Mr. Freeman Barrett, for the defendants, contended that the crane was no more a building than a railway truck that ran on wheels, or a roundabout. Mr. Dimes, for the Council, said section 7 was purposely framed to meet a case of this kind. Mr. Garrett, the magistrate, said in a popular sense the structure was a building, no doubt, but if he held it to be one in the legal sense he would be opening a very wide field, and all pieces of

machinery erected in yards would come within the province of the London County Council. In his judgment a structure must be in the nature of a building erected in the style of a house or shed. He accordingly dismissed this summons with £5 5s. costs.

Notes and News.

The Arts and Crafts Society is now holding its eighth exhibition—now triennial—at the Grafton Galleries. Some very interesting furniture is included in the collection.

At All Saints' Church, Belfast (in University Street) a new chancel has been added by Messrs. H. Laverty & Sons, builders, under the supervision of Mr. W. J. Fennell, M.R.I.A., architect, of Belfast.

Dublin Master-Builders' Association.—Mr. James Beckett has been elected president of this Association for 1906, Mr. R. D. Bolton vice-president, and Mr. John Good (55, Great Brunswick Street, Dublin) hon. secretary.

Reinforced Concrete on the Hennebique System will be used for the first time in Edinburgh at a large extension which is to be made to the Parkside works of Messrs. Nelson & Sons, publishers. The architects are Messrs. Cousin, Ormiston & Taylor.

Liverpool Architectural Society.—At the meeting of this Society held on Monday evening, Mr. T. T. Rees, F.R.I.B.A., read a paper on "The laying-out of streets, buildings, open spaces, parks, planting of trees, advertising hoardings and smoke nuisances," illustrated by lantern slides.

A Mock Arbitration Case *re* "Land near Highgate Road, N.W.," was heard at the Surveyors' Institution (junior meeting) on Monday evening. Mr. Howard Martin was the sole arbitrator, Mr. Sidney A. Smith and Mr. C. H. Dinwiddy were counsel for the claimant, and Mr. J. D. Young and Mr. F. S. Chesterton counsel for the promoters.

A new Weaving Mill.—The foundation-stones of the new Peel Mill at Darwen, which is being built by the Darwen Mill-Building Co., were laid recently. Messrs. John T. Henshaw, of Blackburn, are the architects and Mr. Robert Shorrocks is the contractor. The building is to be a twin mill to the newly-erected Cobden Mill.

Forthcoming Lectures at the Royal Sanitary Institute.—At the Royal Sanitary Institute the following lectures are to be delivered:—

March 19th, 21st and 30th, Mr. A. Saxon Snell, three lectures respectively on "Building Materials," "Sanitary Building Construction and Planning," and "Ventilation, Warming and Lighting."

March 26th and April 2nd, Mr. W. C. Tyndale, two lectures respectively on "Sanitary Appliances" and "House Drainage."

March 28th, Mr. J. Wright Clarke on "Details of Plumbers' Work."

Royal Academy Lectures.—The lectures on architecture and sculpture to be delivered at the Royal Academy during February and March are as follows:—

Mr. T. G. Jackson, R.A., four addresses on "Reason in Architecture," February 5th, 8th, 12th and 15th.

Mr. W. R. Colton, A.R.A., two addresses—"Enthusiasm in the Pursuit of Sculpture" on February 19th and "The Rough-hewed and the Imitation of Life" on February 22nd.

Mr. W. Goscombe John, A.R.A., on "Modern Sculpture" on February 26th.

Sir William Richmond, R.A., three addresses on "The Evolution of Sculpture—Egypt and Greece," March 1st, 5th and 8th.

Dover Harbour Improvements.—At Dover last week, after very noisy scenes, a public meeting at the town hall approved the corporation's scheme for a viaduct road, at a cost of £42,000, in connection with the harbour improvements. Sir William Crundall gave details of the great marine station, on which the harbour board will spend £600,000, and stated that the board hoped that King Edward would lay the foundation-stone in June. Work on the new Duke of York's School at Dover has been commenced by the contractors.

Mr. J. E. Sears, F.R.I.B.A., has been elected M.P. for Cheltenham.

At Colonial House, Liverpool, the new premises of Messrs. Elder, Dempster & Co. (illustrated in our issue for last week), the mosaic flooring was carried out by Messrs. Diespeker, Ltd.

Stone Preservation.—Stone buildings at Glasgow are being successfully impregnated with paraffin wax on the Farnham process. This arrests decay, and is stated to be permanent in effect.

Commemorative Tablets are to be placed on the residence of Thomas Carlyle at 33, Ampton Street; of William Wilberforce at Broomwood House, Clapham; and on 4, Carlton Gardens to mark the fact that Lord Palmerston resided there.

Scholarships for Students of the Surveyors' Institution.—The offer of the Surveyors' Institution to establish three scholarships at Cambridge University, value £80 each and tenable for three years, open only to students of the Institution, has been accepted by the Senate.

Wolverhampton and District Architectural Association.—The annual general meeting of this Association, held on January 18th, was of a business nature, the president (Mr. Fred T. Beck) being unable to be deliver his annual address through indisposition. The vice-president (Mr. W. Edwards) presided.

Architects' Benevolent Society.—Mr. Walter Emden having made an offer of £50 towards the funds of this much-deserving Society conditional on nine other gentlemen also subscribing a similar amount each, making £500 in all, Mr. H. Chatfield Clarke, F.R.I.B.A., has now come forward as the third donor of £50 in response to the appeal.

The Gold Medal of the Society of Architects has been conferred on Mr. Walter W. Thomas, past-president, of Liverpool, in recognition of his services in promoting the interests of the Society. Former recipients have been Mr. Robert Walker, of Cork (president 1890-1 and 1893-7) and Mr. Walter Emden, president for four years.

Changes of Address.—Messrs. Chambers & Martin, architects and surveyors, have removed their offices from No. 2, Lancaster Place, Waterloo Bridge, to Waldorf Chambers, Aldwych, W.C., adjoining the Waldorf Theatre.—Mr. F. C. Moscrof Young, architect and surveyor, has also removed his offices from No. 2, Lancaster Place, Strand, to Waldorf Chambers.

Proposed New County Hospital for Westmorland.—The president (Mr. W. D. Crewdson) and the hon. secretary (Mr. Colin Somervell) of the Kendal Memorial Hospital Committee have issued a statement in regard to the proposed building of a new county hospital for Westmorland. Plans have been prepared by Mr. J. F. Curwen and approved by Mr. Rowland Plumble. It is estimated that the building will cost about £12,000.

Vaults underneath the Courtyard of Charing Cross Station have been found in the course of excavation work for the tube railway. They are about 16ft. below the surface, built of bricks, with stone arches 6ft. or 7ft. high. The vaults occupied about a quarter of the area of the courtyard, and it is believed they are some of the old storage places of the Hungerford Fish Market, which occupied the site of the railway station.

"Cardinal Wolsey's Palace," No. 17, Fleet Street, the restoration of which was completed before Christmas, will cost London altogether £28,700. The committee of the County Council which has charge of the work is considering the question of utilizing the interesting room on the first floor, which has oak panelling and carving belonging to the original building, while the ceiling is an excellent example of Jacobean plasterwork.

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:—

Retention of buildings on the south side of Morning Lane, Hackney, between Belsham Street and the "Duke of Wellington" public-house, and the erection of buildings on a site abutting upon Morning Lane, Belsham Street and Stockman Road, on the further application of Hodson & Whitehead. (*Consent.*)

Additions to Nos. 68 and 74, Peckham Road, and four-storey bay windows at Nos. 68, 70, 72, and 74, Peckham Road, Camberwell, on the application of A. E. Mullins, on behalf of J. Tee. (*Consent.*)

Retention of a projecting porch in front of No. 4, Eddystone Road, Crofton Park, Lewisham, on the application of Mrs. F. G. Small. (*Consent.*)

Projecting porch in front of Nos. 33 and 34, Tavistock Place, St. Pancras, on the application of G. S. Wain, on behalf of F. W. Smith. (*Consent.*)

One-storey building at the rear of No. 123, Maida Vale, Paddington, with external walls at less than the prescribed distance from the centre of the roadway of Canterbury Terrace, on the application of D. C. Martin & Son, on behalf of M. Goodman. (*Consent.*)

Bay windows to Nos. 10 and 12, Glenshell Road, Eltham, on the application of J. J. Bassett, on behalf of A. Cameron Corbett. (*Consent.*)

Projecting porch in front of No. 69, Bostall Hill, Plumstead, on the application of W. B. Sheppard, on behalf of the Royal Arsenal Co-operative Society, Ltd. (*Consent.*)

Two projecting balconies in front of Nos. 10 and 11, Park Place, St. George, Hanover Square, on the application of Hart & Waterhouse. (*Consent.*)

Buildings on the site of Nos. 3, 4, 5, 6 and 7, Cleveland Row, St. James's, on the application of F. T. Verity, on behalf of J. H. Lukach. (*Consent.*)

Hotel building on a site on the west side of Gordon Street, St. Pancras, to abut also upon Gower Place and Little Gower Place, on the application of T. E. Colcutt and Stanley Hamp, on behalf of H. Regnart. (*Consent.*)

An iron structure upon the forecourt of No. 205, Clapham Road, Brixton, on the further application of H. J. Doughty. (*Refusal.*)

An advertisement board in front of No. 109, King Street, Hammersmith, on the application of F. J. Weary & Co. on behalf of Messrs. Rosenberg. (*Refusal.*)

Re-erection of No. 6, Thomas Street, Woolwich, with external walls at less than the prescribed distance from the centre of a footway leading from Thomas Street to Peakes Place, on the application of F. J. Gurney, on behalf of the Cheltenham and Gloucester Permanent Building Society. (*Consent.*)

Buildings on the south side of Talgarth Road, West Kensington, abutting upon Gliddon Road, on the application of F. P. Marwood. (*Refusal.*)

Iron lean-to van-shed on the east side of Green Lane, Lavender Hill, Battersea, on the application of W. C. Poole, on behalf of Stanley & Co. (*Consent.*)

Wood and slate played in the grounds of the Grey Coat Hospital, on the west side of Horseferry Road, Westminster, at less than the prescribed distance from the centre of the roadway of such street, on the application of J. O. Smith, on behalf of the governors of the Grey Coat Hospital. (*Consent.*)

Two external iron gangways to connect buildings on the north and south sides of Old Court, Hackney Road, Hackney, and an external iron gangway to connect No. 31, Hackney Road, with buildings on the south side of Cotton's Gardens, on the application of J. E. Saunders, on behalf of Howard, Wall & Co. (*Consent.*)

Means of escape in case of fire proposed to be provided on the sixth (top) and fifth storeys of a proposed building on the south side of the Strand, abutting upon Milford Lane, the upper surfaces of the floors of which storeys are above 6ft. from the street level, on the application of Henry T. Hare, on behalf of the United Kingdom Provident Institution. (*Consent.*)

Street out of the north side of Braidwood Road, Lewisham, at the rear of buildings abutting upon Muirkirk Road, and in connection therewith the erection of stable-buildings, on the application of E. H. Harrison, on behalf of Mr. J. Johnson. (*Consent.*)

New street for carriage traffic in continuation northward of Bloemfontein Road, Uxbridge Road, Hammersmith, on the application of R. B. Grantham & Son, on behalf of the Ecclesiastical Commissioners. (*Consent.*)

New street for carriage traffic out of the north-west side of Nimrod Road, Streatham, on the application of D. Young & Co., on behalf of A. W. Gosden & H. F. Crunden. (*Consent.*)

New street for carriage traffic to lead from Fernhill Street to Auberon Street, North Woolwich, on the application of Beale & Co., on behalf of Colonel Kennard. (*Consent.*)

Projecting one-storey shop in front of No. 88, Clapham Park Road, Clapham, on the application of H. Smith, on behalf of H. and C. Davis & Co. (*Consent.*)

Retention of porches to Nos. 7, 8, 9, 10, 11 and 12, Ruskin Walk, Herne Hill, on the application of R. L. Muskin. (*Consent.*)

Additions to a house known as "Harlestone," on the south side of Mortimer Road, Kilburn Priory, on the application of W. Reynolds-Stephens. (*Consent.*)

Building on a site between Nos. 11 and 13, Portland Place, St. Marylebone, on the further application of V. Buckland & Gerrard, on behalf of the Right Hon. Earl Temple. (*Consent.*)

Buildings on the site of Nos. 247 to 257, Fulham Road, Chelsea, on the application of Elms & Jupp, on behalf of R. C. H. Sloane Stanley. (*Refusal.*)

Raising of projecting one-storey shops in front of Nos. 168 and 170, Edgware Road, Marylebone, on the application of J. W. Stevens, on behalf of E. S. Burns. (*Refusal.*)

Iron and glass shelter in front of the South London Central Mission, New Kent Road, Walworth, on the application of A. Conder, on behalf of the Rev. A. Mearns. (*Refusal.*)

Houses on the site of Nos. 1 to 12, King's Court, Southwark, with external walls at less than the prescribed distance from the centre of the roadways of King's Court and Prince's Place, on the application of A. Burr, on behalf of the trustees of the Jolly Trust. (*Consent.*)

Addition to the St. John's Schools, Halley Street, Stepney, with external walls at less than the prescribed distance from the centre of the roadway of John Street, on the application of T. J. Bailey, on behalf of the Education Committee of the Council. (*Consent.*)

Temporary buildings at the school, Gipsy Road, Norwood, on the application of T. J. Bailey, on behalf of the Education Committee of the Council. (*Consent.*)

Retention of a lavatory addition to the United Services Club, Pall Mall, abutting upon Waterloo Place, on the application of H. L. Florence, on behalf of the trustees of the United Services Club. (*Consent.*)

Projecting one-storey shops in front of Nos. 123 and 125, Fortress Road, St. Pancras, on the application of T. Fraser, on behalf of T. H. Hawkins. (*Refusal.*)

Projecting one-storey shops in front of Nos. 103 to 121 (odd numbers only) inclusive, Fortress Road, St. Pancras, on the application of T. Fraser. (*Refusal.*)

Retention of a building at the rear of No. 35, Thornhill Road, Islington, with a forecourt boundary at less than the prescribed distance from the centre of the roadway of the southern arm of Barnsbury Square, on the application of F. J. Eedle & Meyers, on behalf of T. Heath. (*Refusal.*)

Artizans' dwellings on the north-eastern side of Pond Place, Chelsea, on the application of Joseph & Smithem, on behalf of the council of the metropolitan borough of Chelsea. (*Consent.*)

Artizans' dwellings on the north-eastern side of Marshall Street, Westminster, in the position, to the height and with irregular open spaces at the rear, on the application of Joseph & Smithem, on behalf of the Council of the City of Westminster. (*Consent.*)

Retention of buildings abutting upon Cathcart Street and Holmes Road, Kentish Town, on the application of P. Dollar, on behalf of Birch Brothers. (*Refusal.*)

Two houses on low-lying land situated at the rear of Nos. 18 and 20, Havil Street, Camberwell, on the application of T. Wilson. (*Consent.*)

Buildings on part of the open space at the rear of Nos. 164 to 172 (even numbers only) inclusive, Earl's Court Road, Kensington, on the application of W. G. Hunt. (*Consent.*)

One-storey shops at Nos. 164 to 172 (even numbers only) inclusive, Earl's Court Road, Kensington, to abut also upon Penyern Road, on the application of W. G. Hunt, on behalf of Jones Brothers. (*Consent.*)

Retention and completion of a building on the south side of Dalgarno Gardens and western side of Bracewell Road, Hammersmith, on the application of P. Tinckham. (*Refusal.*)

Three houses, and the retention of nine houses, on the east side of Garratt Lane, Wandsworth, between Quinton Street and Littleton Street, and the retention of a house on the west side of Trannere Road, abutting upon Quinton Street, on the application of Holloway Brothers. (*Consent.*)

Building on a site abutting upon the north side of New Kent Road and the west side of Old Kent Road, Bermondsey, on the application of A. Harrison, on behalf of the council of the metropolitan borough of Southwark. (*Consent.*)

Deviation from the plan approved on 18th July, 1905, in respect of the erection of buildings on the west side of Streatham Hill, at the corner of Drewstead Road, Wandsworth, so far as relates to the erection of an office building on the south side of Drewstead Road, and to an alteration in the space at the rear of the buildings on the west side of Streatham Hill, on the application of Taylor & Sons. (*Consent.*)

Uniting of No. 5, Threadneedle Street with No. 8, Finch Lane, City, on the application of T. B. Whinney, on behalf of the London City and Midland Bank. (*Consent.*)

Deviations from the plans relating to the proposed re-erection of No. 13, Golden Square, Strand, on the application of W. Woodward. (*Refusal.*)

Coming Events.

Wednesday, January 24.

EDINBURGH ARCHITECTURAL ASSOCIATION (Associates' Section).—Mr. J. M'Kessack on "Architectural Photography," at 8 p.m.

Friday, January 26.

JUNIOR INSTITUTION OF ENGINEERS.—Prof. J. D. Cormack on "Notes on Boiler Trials," at 8 p.m.

INSTITUTION OF CIVIL ENGINEERS (Students' Meeting).—Mr. T. R. Grigson on the "Prince of Wales' Pier, Falmouth," and Mr. H. C. H. Etheridge on the "Ferro-concrete Pier at Purfleet," at 8 p.m.

GLASGOW TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Mr. James Campbell Reid on "Architectural Censorship," at 8 p.m.

Saturday, January 27.

ARCHITECTURAL ASSOCIATION.—Visit to the New Central Criminal Court, Old Bailey, at 2 p.m.

JUNIOR INSTITUTION OF ENGINEERS.—Visit to University College Engineering Laboratories.

Monday, January 29.

SURVEYORS' INSTITUTION.—Ordinary General Meeting at 8 p.m.

Tuesday, January 30.

MANCHESTER SOCIETY OF ARCHITECTS.—Mr. J. Norquay on "Hints on Quantity Surveying," at 6.45 p.m.

Wednesday, January 31.

NORTHERN ARCHITECTURAL ASSOCIATION.—Mr. A. W. S. Cross on "Rome in the Augustan Age," at 7.30 p.m.

SOCIETY OF ARTS.—Mr. T. Adams on "The Garden City and the Cheap Cottage," at 8 p.m.

ARCHITECTURAL ASSOCIATION (Discussion Section).—Mr. A. C. Dickie on "Internal Steps and Stairs and their Treatment," at 7.30 p.m.

Friday, February 2.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Mr. H. V. Lanchester, F.R.I.B.A., on "Cardiff Municipal Buildings."

ARCHITECTURAL ASSOCIATION.—Students' Smoking Concert, Gaiety Restaurant, at 8 p.m.

JUNIOR INSTITUTION OF ENGINEERS.—Mr. Kenelm Edgcombe, M.I.E.E., on "Some Recent Electrical Engineering Measuring Instruments," at the Westminster Palace Hotel, at 8 p.m.

Monday, February 5.

ROYAL ACADEMY.—Mr. T. G. Jackson, R.A., on "Reason in Architecture."

Sanitary Engineers

and Specialists, . .

LONDON OFFICES: 28, Victoria Street, Westminster, S.W.

WORKS - - Corporation Street, Sheffield.

ARE EXECUTING

SANITARY and PLUMBING CONTRACTS

AT

Mersey Docks and Harbour Board's
New Offices, Liverpool.

New Workhouse, Kirkham, Lancs.

Ritz Hotel, Piccadilly, London, W.

Firvale Workhouse, Sheffield.

Euston Station, London.

And at many other large buildings throughout the Country.

MELLOWES & CO., Limited,

are prepared to give Specification

Schemes and Estimates for all

Classes of Sanitary Plumbing

and Drainage Work,

Water, and Fire

Mains, Heating,

etc., etc.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Weight on Girder.

MANCHESTER.—F. J. A. writes: "The answer to my enquiry as to weight carried by girder over shop front does not quite state what I want to know. You give me the weight of brickwork on girder only. I ask for the total weight (near enough for practical purposes) carried by the girder—that is to say, brickwork, floor which is carried by girder, and roof."

Assuming that the total dead load on the roof is 20 lbs. per sq. ft. of horizontal projection, and that the vertical component of the windload is 35 lbs., and weight of ceiling 10 lbs. per sq. ft., we have a total load of 65 lbs. per sq. ft. to be carried on the wall. Assuming also a total dead and live load on floor of 125 lbs. per sq. ft. and the weight (as per our previous answer to this question) 12,667 lbs., we have—

Roof and ceiling, 14ft. x 16ft. x 65 lbs. + 2	7,280
Floor 12ft. x 16ft. x 125 lbs. + 2	12,000
Wall - - - - -	12,667

Total uniform load on girder = 31,947

Say 32,000 lbs., or approximately, 14½ tons.

The maximum bending moment in the beam will be $\frac{32,000 \times 17\text{ft.} \times 12}{8} = 816,000$ inch-lbs.

For a fibre stress of 16,000 lbs. per sq. in. the section modulus required would be $\frac{816,000}{16,000} = 51$ inch³. The most economical

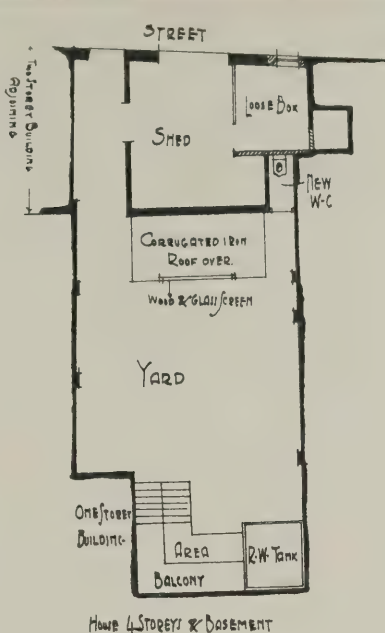

British standard beam to use is 12in. x 6in. x 144 lbs. The section modulus of this beam is 52.57. B.

Adjoining Owners: Right to heighten Wall.

S. writes: "A and B are adjoining owners. About thirty years ago the wall dividing the back buildings of the two properties and supporting the timbers of the floors and roofs of each was raised 10ft. by A in order to

add a storey to his back buildings. The new roof was made to cover the wall, and the gutter to project 2ins. beyond the face of the wall on B's side. B now wishes to raise his back buildings, to make use of the upper part of the wall (built by A) to support his (B's) roof timbers and to lay along the top of the wall a lead gutter common to both and taking away the water from both A's and B's roofs. Has B the right to do this, and is it necessary for him to serve a notice on A? A's solicitor says B has no right to use the wall above the height of his (B's)

PLAN AS PROPOSED

PLAN AS AT PRESENT

PLANS FOR ALTERATIONS.

old buildings—that is, he has no right to use the portion added by A thirty years ago: and that even if he had right he could not strip slates from A's roof in order to lay the new lead gutter. B's solicitor says that A has acquired ownership of the whole of the wall from top to bottom by having built upon it and roofed it and remained in possession of it for 30 years. I am acting as architect for B. I took the wall as a party-wall, and maintain it to be so in spite of the above opinions. Am I right? There are no writings or plans defining any boundaries."

A's solicitor is quite right. The ownership of this wall is divided horizontally at the uppermost point of B's building; below that point the wall may be (1) a party-wall, or (2) A's wall, subject to an easement on B's part, and above that point the wall is entirely A's property. The case of *Weston v. Arnold* (Law Reports, 8 Ch. 1084) deals with an exactly similar position. If you have access to the "Transactions" of the Surveyors' Institution you will find an almost exhaustive paper on this difficult subject in volume 24 (1891-2). F. S. I.

Submission of Plans for Alterations.

SCARBOROUGH.—UNDECIDED writes: "The accompanying plans represent a portion of premises recently taken over. Would it be possible to make the small alteration shown without submitting plans to the urban authority, whose by-laws practically coincide with those issued by the Local Government Board? Also, have the council power to veto the work under their by-laws? The existing shed is of one storey. The old roofs would not be touched, a new roof being provided to the new w.c. Alternatively, have the council power to veto a new two-storey building of similar height and section to that adjoining? It is undesirable to approach the council unless it is practically certain that the alterations will be approved, as the present arrangement is most insatisfactory, and there is a great probability that the whole premises might be condemned."

I fear that there is no doubt you must submit plans for this work and give the usual notices to the local authority. The alterations shown are small but are not exempt from the operation of the by-laws. The urban council cannot veto a two-storey building if it is to be built in accordance with the by-laws and you have sufficient air-space in the rear. F. S. I.

Right of Council to ask for Elevations.

TONDU.—E. B. & S. write: "A few weeks ago we forwarded plans of four small cottages to the rural district council for their approval, but we showed no elevation. The plans were refused and sent back with a letter requiring an elevation. This we sent under protest. They were again refused, the surveyor stating to his council that he required yet another elevation. In no part of the by-laws in force by the council can we see any mention of an elevation being required. Section 52 states that plans and sections to a scale of 8ft. to an inch and a block plan to a scale of not less than 44ft. to an inch are required. The same wording occurs in the requirements for the laying-out of streets, and surely no elevation can be made of a street! By demanding one elevation the surveyor seems to us to be at liberty to demand the four. As an instance of an opposite view, we give you the following:—Some time ago we sent to the urban district council adjoining the above rural district council plans of some large houses and shops, in this case also not sending an elevation, and they were passed at once, the surveyor then remarking that elevations could not be demanded. Yet the by-laws in force by both councils are the same. We also know of other urban district councils where elevations are not sent in and not demanded, though as a rule we send one with all our plans, but think that if not distinctly asked for in the by-laws the surveyor has no authority to demand one or more as he likes."

The Model By-laws call only for "complete plans and sections of every floor," and I believe you are correct in your contention that elevations cannot be legally demanded. Is it, however, worth while to contest so small a point, annoying though, no doubt, the surveyor's action has been? F. S. I.

Oversailing Courses on Chimneys.

HANDSWORTH.—DILEMMA writes: "I have recently erected some chimneys, the side faces of which were flush on the boundary line of our land, and have returned the moulded courses to the caps round the sides, overhanging about 4½ins. over the adjoining land. The adjoining owner objects to the oversailing courses overhanging his land, and demands that I shall cut them off at once. Can he legally enforce this? I have asked several architects, but they were

unable to tell me whether by law the adjoining owner could compel me to cut off the courses. I can see any number of chimneys in similar circumstances, similarly treated, and, as I knew before erecting them that these courses, being simply ornament, carried no easement, I am very loth to spoil my chimneys, and shall not do so unless the law compels me."

Upon the broad principle "that the land that one buys is one's own to the skies" you have undoubtedly committed a trespass in building the smallest portion of your chimney over the adjoining land, and I advise you to make the best terms with your neighbour which you are able. Probably the footings of your wall are also projecting into his property. You should have kept your external wall $4\frac{1}{2}$ ins. within your boundary had you intended to build in this way. F. S. I.

A Building Plot.

STRONG writes: "I wish to buy a piece of vacant land in a town at the junction of two roads, and desire to erect a building thereon. The corporation wish to widen one of the roads, and have drawn an improvement line on the ordnance survey on the road in question, which can be seen at their offices. I want to know before purchasing the land (1) whether the corporation are obliged to give their consent for the erection of a suitable building on application being made to them; (2) whether such a building can be built to the road improvement line, notwithstanding that buildings stand further back than the improvement line, though at a distance of several hundred yards buildings come to the causeway; (3) whether I should be obliged to sell to the corporation the amount of land required by them for less than cost price, such price being reasonable market value."

(1) Yes, if the proposed building is in accordance with the by-laws. (2) This would be in the discretion of the corporation. Section 3 of the Public Health Act, 1888, provides that the building owner may not erect any building beyond the front main wall of the building on either side of it without the consent of the local authority. (3) If any land be taken from you compulsorily you must be properly compensated for the land taken and for any other damage suffered by you in consequence of such compulsory taking, and if necessary the amount to be paid must be settled by arbitration. The fact that you have recently paid a certain price for the land would constitute strong evidence of value. F. S. I.

Expansion of Cement.

YORK. — J. W. writes: "In the British standard specification for Portland cement (issued by the Engineering Standards Committee) a description of the Le Chatelier test is given in clause 11, which closes with the words: 'The difference between the two measurements represents the expansion of the cement, which must not exceed the limits laid down in the specification.' The specification does not give limits; what should they be?"

The words you quote are at the end of clause 11. The limit of expansion is given in the opening sentence of the same clause.

Formulae for Beam.

M. C. O. writes: "Rivington, vol. 4, and Mitchell's 'Advanced Building Construction' give maximum bending moment for beam with distributed load, supported at ends $\frac{wl^2}{8}$, but Charnock's 'Graphic Statics,' vol. 2, Dorman, Long & Co.'s and Redpath, Brown & Co.'s catalogues give $\frac{wl}{8}$. Which is correct?"

The formula $\frac{wl}{8}$ is generally given as $\frac{wl^2}{8}$

where w = load per foot run in tons, l = span in feet, 8 = coefficient for uniformly distributed load on beam with ends supported.

The formula $\frac{wl}{8}$ is the usual form for a total distributed load, so that $w = wl$; hence the exact agreement in value of the two formulæ for the bending moment.

HENRY ADAMS.

Widenings and New "Streets."

LONDON. — R. N. writes: "Does the widening of a street constitute a 'new street'?"

It is impossible to give an opinion without having all the details. There have been several decisions more or less bearing on the point; and some of them are conflicting. The enquiry does not state if the street is at present repairable by the inhabitants generally, or if there are houses on one or both sides of it; both of which questions have an important bearing on the case.

Mr. WALMSLEY ON MODERN SURVEYING INSTRUMENTS.

AT last week's meeting of the Surveyors' Institution Mr. Arthur T. Walmisley, M.I.C.E., read an interesting paper on "Modern Surveying Instruments." He said there was no survey so accurate as an ordinary chain survey properly triangulated, and the measurement of horizontal distances in levelling operations by the chain was a system unrivalled for correctness. Various ingenious devices had nevertheless been brought forward to attain not only records of levels but also horizontal measurements by optical instruments (many forming the subject of patents), and for giving greater simplicity of setting up during out-door work, transport in the field, and other improvements calculated to aid speed, accuracy and concise records.

There had been many consecutive improvements upon old forms of instruments, and the development of modern machinery had greatly contributed to securing perfection of wearing surface combined with solidity.

Dumpy Levels and Theodolites.

The best form of level was largely a matter of experience. For a beginner a 14 in. dumpy level without the addition of a compass (which only increased the cost), and with comparatively heavy tripod legs for stability in the field, would undoubtedly prove the most suitable, but an experienced surveyor could work equally well with a 12 in. or even with a 10 in. telescope, supported upon lighter tripod legs.

Mr. Walmisley proceeded to refer to modern improved instruments—Cushing's level, Cooke's reversible level, Pastorelli's level, Jahn's level, Doering's level (which has a gimbal-joint action in the tripod head, so that on uneven ground the tripod can be put down anywhere and the telescope adjusted by the vertical arcs of the instrument), the new engineer's level made by W. F. Stanley, and Troughton's and Simms's level.

Adjusting the Line of Collimation.

The line joining the optical centre of the object-glass and a point in the line of the horizontal wire of the diaphragm should be horizontal when the bubble was in the centre of its opening. Whenever the object-glass had been removed a re-determination of this adjustment, known as the adjustment of the line of collimation, was necessary for absolute accuracy. Hence upon receiving a new instrument from the makers Mr. Walmisley said he always took the precaution to file a mark across the junction of the object-glass holder with the telescope, in order to ensure the replacement of its screwed end in its proper position after removal for purposes of drying or cleaning the object-glass.

In the majority of modern dumpy levels

Stadia Lines

were added in the diaphragm set to $\frac{1}{100}$, so that in taking the readings on a distant staff by means of these subtense lines the surveyor read every $\frac{1}{100}$ ft. (or metre) upon the staff as being equal to 1 ft. (or metre) of the distance from the centre of the instrument, adding to the reading a constant for any distance shown. This constant was usually given by the maker of the instrument, and could be checked experimentally by the surveyor. With regard to

The Diaphragm

this might consist of (a) webs, (b) platinum iridium points or (c) lines on glass. Mr. W. F. Stanley argued that the use of iridium points obviated the covering of the divisions on a level staff, but Messrs. Troughton & Simms adhered to the old form of spider-web diaphragms as preferable both for reading an ordinary level staff or a special stadia rod. Messrs. T. Cooke & Sons also maintained the superiority of web diaphragms except for reversible eye-pieces.

Various modern theodolites were next discussed by Mr. Walmisley, and reference was made to the Hoffman tripod head, which combines the action of a ball and socket joint with the rigidity of the ordinary parallel plates.

The Tacheometer.

Speaking of this addition Mr. Walmisley said that the use of an anallatic or conveying lens ($6\frac{1}{2}$ ins. focal length to an object-glass of 12 in. focal length) in a tacheometer dispensed with the addition to every reading of what was called "the constant" of the instrument, which was always necessary in the case of theodolites merely provided with stadia lines to attain a similar object.

Stanley's Inclinometer

(Lister's patent) was somewhat similar in construction to a theodolite, but with the addition of an extra vertical axis to the telescope carried through the horizontal axis at right angles. By this means the telescope could be moved upon this supplementary vertical axis in a plane of any inclination desired, so that if the horizontal axis were set to the slope of a railway cutting a number of pegs might be set out continuously with the same setting by direct observation through the telescope across any inclination of the land surface.

By the use of such an instrument an immense amount of work might be saved in setting-out the surface of land for widths of slopes or batters by pegs, over the ordinary system of pegging, by calculation with a theodolite, where each peg required a separate setting of the instrument. In taking cross-sections and all levelling on sloping uneven ground the saving of time and labour was also very great, and the work resulting therefrom was sufficiently accurate for trial sections and preliminary investigations.

Sheldon's suspension level, the Grubb circumferentor, Puller's new tachymeter, the eidograph (which has superseded the pentagraph), Amsler's planimeter for the measurement of areas in square inches and other instruments were described, and, lastly, reference was made to

The Application of Photography to Surveying

(as shown by Mr. Bridges Lee), Mr. Walmisley observing it was probable that photography would prove quite as satisfactory a process as fixing survey lines by the magnetic needle of a compass for general plans, and that it would come gradually into greater use for assisting the surveyor to record not only the base lines of plans but the vertical section lines of the surface of the ground. Building plans, in which dimensions were to be stated, had of course to be correctly measured in the field, but for index or key plans the value of photography was universally acknowledged.

THE FOREIGN COMPETITOR IN THE BUILDING TRADE.

SPEAKING recently at Reading, Mr. G. H. Johnstone (Conservative and Unionist candidate) dealt with the question of unemployment as it affected the building trade. As to the cause of this unemployment and the slackness of the trade of which it was the expression, those who wished for some alteration in the present fiscal system were of opinion that it was due entirely to the fact that certain articles which they felt could and should be made in England were made and manufactured in foreign countries. After reading a letter which had appeared in a local contemporary in which the writer said that the altar rails used in church extension work at Caversham were made in Belgium and put up by Belgian workmen, as an instance of the way in which foreign competition was affecting the trade, Mr. Johnstone said he would first turn their attention to

The Importation of Foreign Doors.

They had only to go down to one of the wharves at Reading to see arriving week by week large barge-loads of doors which had come from foreign countries. He believed it was a fact that those doors were brought into the town and sold at 4s. 3d. each, which was, he understood, less than the price at which the raw material of which the doors were made could be bought here. Foreign manufacturers were selling their goods in England under the price at which the Englishman could make them, and that was why the trade was being ruined. He inspected a house recently built near Reading in which all the doors, window frames and sashes, floors and every particle of "inside building" had been brought over from France and put in by French labourers.

Granite Industry Going.

The granite industry had also suffered. It used to be one of the very best of Cornish industries, but it had become absolutely stagnant owing to foreign importations. In the Keyham extension works almost all the granite used came from Norway and Sweden. The curb granite trade up to 1880 was a most important branch of the industry, more than 20,000 tons being shipped every year from Devon and Cornwall. But it had now become almost extinct, owing to the increasing use of foreign granite, while the heavy engineering work had also been attacked of recent years, more than 2,000,000 cub. ft. having been shipped from Norway and Sweden for dock and harbour works in Great Britain.

French and American Slates.

Slates too were affected, the exports to foreign countries in 1902 having been £30,000, while in 1904 they were only £24,000. French and American slates were dumped on the English market at 15 to 20 per cent. less than the home prices, with the result that the Welsh and the English quarries were only working two or three days per week, while their stock was daily increasing with no chance of sale, whereas four years ago the Welsh quarries were in full swing and unable to cope with the demand.

There were also being brought into the country from abroad a large number of bungalows ready for fitting up.

Bricks.

Our exports of bricks to foreign countries in 1889 were worth £220,000, whereas in 1904 they were only £150,000, but the increased exportation to the Colonies counter-balanced the decreased supply to foreign countries. The tariff put on English bricks by foreign countries went far to explain the diminished exports.

The cabinet and furniture trade had the same tale to tell, while as to the cement trade he would not give any figures, for again the facts were similar.

Aberdeen Granite Association and Protection.

At a recent meeting of the members of the Aberdeen Granite Association a resolution was passed affirming "the necessity for fiscal reform in order to secure fair conditions for employers and workmen," and appointing a committee to prepare a statement of facts for publication, together with an appeal to the general public to support the candidates for Parliament favourable to fiscal reform.

A CLERK OF WORKS ON MORTAR.

AT last week's meeting of the architectural section of the Royal Philosophical Society of Glasgow Mr. Samuel Smith, clerk of works at the new Glasgow Technical College, read a paper on "Mortar."

After briefly referring to the conversion, by burning, of limestone into caustic or quick lime, and describing the chemical changes that take place during the operation, he went on to show how an ordinary lime set or hardened by the action of the carbonic acid gas in the atmosphere. The gas, aided by the water with which the mortar was mixed, reconverted the slaked lime into the carbonate of lime, or limestone. He also showed how sand, in addition to counteracting the shrinkage of the lime, assists in the process of setting.

Excellence of Old Mortar.

By the aid of diagrams he showed the difference in composition of the various limes that are classed as natural hydraulic and artificial hydraulic limes. Specimens of various mortars were exhibited, one being from the foundations of the old Andersonian Buildings, recently demolished to make room for the extension of the Technical College buildings. On analysis this mortar was found to be composed of 1 part of Roman cement (in all probability from the quarry at Crossbasket) and 1 of sand. It was in a perfect state of preservation, while the ordinary Scotch lime mortar used for the rest of the building was friable and rotten. Mr. Smith was of opinion that this mortar was prepared in 1836, nearly 70 years ago.

Another sample shown was a piece of mortar composed of 1 part Arden lime, 1 of engine ashes and 1 of freestone shivers, ground together in a mortar mill. This, to judge by the sample shown, made a first-class mortar.

Mr. Smith then described the process of the manufacture of Portland cement, which was an artificial hydraulic lime, and described various mechanical tests of the quality of that material, giving also its chemical constitution. He then went on to speak of

Sand and its Substitutes.

showing how to test sand for mud and other impurities, and gave a description of some of the substitutes.

After describing the methods of slaking and mixing mortar, he spoke of the evils of remixing or softening up of hydraulic limes. By the aid of a large diagram it was shown that Arden lime mortar to which water was added after it had commenced to set lost all its hydraulicity or setting power and became the same as an ordinary fat lime, which had to depend on the assistance of the carbonic acid gas to help it to set.

The lecture closed with a description of the effects of frost on mortar and the various expedients adopted to counteract them.

Obituary.

Mr. John Walker, of Messrs. Walker & Slater, builders, of Derby, died recently, aged 64.

Mr. Walter Woodward, of the firm of Woodward, Clark & Co., timber merchants, of Nottingham, died worth £13,660.

SCOTLAND'S HISTORICAL BUILDINGS.

What H.M.'s Office of Works is doing.

MR. W. T. OLDRIEVE, principal architect for Scotland of H.M. Office of Works, read a paper at last Wednesday's meeting of the Edinburgh Architectural Association in the course of which he explained what his Department was doing for national historical buildings in Scotland. He said that Scotland was rich in remains of architectural monuments of the past, but the greater number of these were under no official cognizance. That being so, the work of the National Art Survey of Scotland deserved special notice and recognition; he could not imagine a more praiseworthy scheme than that of encouraging architectural students under proper guidance to systematically measure and sketch the more important architectural remains. If these were tabulated and published in due course, they would be of universal value for reference when the official inventory was compiled.

The historic buildings and remains over which his Department had direct control might be classified under two heads—(1) buildings vested in the Department, and (2) architectural and antiquarian remains of which the Commissioners of Works were custodians under the Ancient Monument Acts. It was now recognized, however, that other Government Departments which carried out building works referred to the Commissioners of H.M. Works cases which affected ancient buildings of an architectural character, as, for instance, the War Department with reference to Edinburgh Castle, Stirling Castle, &c., and the Admiralty Department in the case of Rosyth Castle, a proposed restoration of which was contemplated.

Mr. Oldrieve then enumerated the archaeological remains and ancient monuments under the charge of his Department, after which he proceeded to show by means of limelight views other important historical buildings under the charge of the Board of Works on which certain restorations had recently been made. First among these was

Edinburgh Castle.

the care of which, he said, had now been transferred from the Royal Engineers' Department of the War Office to H.M. Board of Works. One of the first things that was done was to rearrange, at a cost of about £1,000, the fire appliances at the castle, and on that account it was now much safer from fire than it had formerly been. They were also considering how best to re-model the block known as the "new barracks." He was quite alive to the necessity of moving very carefully in the matter, and before anything was actually attempted upon the building itself he should endeavour to have not only photographs and perspective sketches from various standpoints, but a model prepared for full consideration.

Holyrood Palace.

In regard to this building he mentioned the restoration which had just been carried out in Queen Mary's audience chamber by the removal of a comparatively modern partition which divided the room into two parts. Visitors would now be able to see the chamber practically as it was at the famous interview of John Knox with Queen Mary, and it would be worth while to look at the old ceiling, now that it could be properly seen, especially as it was the only ceiling which was part of the original building as occupied at the Queen Mary period.

Lastly Mr. Oldrieve directed attention to the restoration of Parliament Hall, and to the preservation work which had been executed at Linlithgow Palace, at Dunfermline Abbey, at St. Andrew's Cathedral (where in September last stone coffins of the priors had been discovered), at Arbroath Abbey, Dundrennan Abbey, Fortrose Cathedral, Haddington Abbey and Rosyth Castle.

Complete List of Contracts Open.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
BUILDING :			
Jan. 25	Fressingfield—School	Managers	Rev. Canon Raven, The Vicarage, Fressingfield.

Contracts Open.

REIGATE UNION.

TENDERS are hereby invited for additional HEATING and HOT-WATER WORKS, including steam boiler, calorifiers, &c., at the Reigate Workhouse, in accordance with plans and specifications and quantities prepared by Messrs. DOLBY & WILLIAMSON, Consulting Engineers, 8, Princes Street, Westminster, S.W.

Each person desiring to Tender will be required to deposit the sum of three guineas, and the person whose Tender is accepted will be required to find satisfactory securities.

The Guardians do not bind themselves to accept the lowest or any Tender.

All applications are to be made to the undersigned immediately, and Tenders must be received by him on or before the 2nd day of FEBRUARY 1906.

(Signed) FRANK C. MORRISON,
Clerk to the Guardians of Reigate Union,
Reigate, Surrey.

TO BUILDERS.

TENDERS are invited for the ERECTION of THREE SHOPS at Shortlands, Kent.

Full particulars can be obtained on application (by letter only) to the Architect, Mr. ARTHUR COLE, "Mogok," Thurlstone Road, West Norwood.

TO HEATING ENGINEERS. BLACKBURN UNION.

The Guardians of the Poor of the Blackburn Union invite TENDERS for the SUPPLY and FIXING of NEW HEATING APPARATUS and ALTERATIONS to EXISTING APPARATUS at their Workhouse, Blackburn.

Full particulars may be obtained from Mr. F. C. RUDDLE, Architect to the Board, 4, King Street, Blackburn.

Tenders to be sent to the undersigned not later than FOUR o'clock on the 26th JANUARY instant, endorsed "Tender for Heating Apparatus."

The Tenders received will be opened on the 27th JANUARY, but the lowest or any Tender will not necessarily be accepted.

Union Offices, Cardwell Place, CHAS. E. BYGRAVE,
Blackburn. Clerk to the Guardians.
9th January, 1906.

COUNTY BOROUGH OF STOCKPORT.

EDUCATION COMMITTEE.
CHESTERGATE COUNCIL SCHOOLS.
TO BUILDERS AND OTHERS.

Persons desirous of TENDERING for the WORKS required in the COMPLETION of the above-named SCHOOLS, of which the foundations, portion of basement, and a small portion of the superstructure have been executed, and for which Messrs. CHEERS & SMITH, Blackburn and London, are the Architects, are requested to send in their names, together with a deposit of 3l. 3s., which will be returned on receipt of a bona-fide Tender, to the undersigned not later than TUESDAY, the 30th JANUARY, 1906, after which date bills of quantities will be supplied, and the drawings and the conditions of Contract may be inspected.

ARTHUR LAWTON,
Secretary to Education Committee.
Education Offices, Stockport
17th January, 1906.

NOTICE TO OUR SUBSCRIBERS.

THE INDEX OF "THE BUILDERS' JOURNAL."

The Title Pages and Index to any volume of "THE BUILDERS' JOURNAL" may be had free, upon application being made to the Office, Great New Street, enclosing 1d. stamp to cover postage of same.

THE VALUE OF OUR EMPLOYMENT REGISTER.

THIS REGISTER was commenced as a serious endeavour on our part to meet a need that is continually felt both by EMPLOYERS and EMPLOYED, and we are pleased at the practical appreciation that has been shown by our readers since THE REGISTER was first started.

Nothing is more trying than to be out of employment, but the difficulty of the position is terribly augmented when money has constantly to be paid for advertisements in order to find other occupation.

On the other hand an Employer who has just obtained an important contract most likely needs you; and has a post to fill that you are wanting, but neither of you can find each other.

THE REGISTER serves this purpose and so meets both cases. For those wanting employment it is an inexpensive means of keeping their names and qualifications before the right people, and for the Employer it is a ready means of finding just the man he wants, without delay.

We are encouraged to find how largely our columns have been instrumental in meeting the requirements of both parties in the manner indicated above, and we thank those advertisers who have written expressing their pleasure and indebtedness to THE REGISTER.

Many have found it an invaluable aid in getting appointments, and we would urge all those who are out of work, or want to change their situations, in fact, all who have a "want," to make use of these columns and thus make THE REGISTER a record of still more value to Employers and Employed.

For 3s. we give 3 insertions (four lines), in our "Appts. Wanted" Columns, and also 6 insertions in the "EMPLOYMENT REGISTER" (see page xx).

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C. Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Abertyswg (Cardiff).—Accepted for the erection of a school for the Rhymney Education Committee:—
W. Williams & Sons, New Tredegar... £1,897

Aberystwyth.—Accepted for the erection of the new Davies memorial laboratories at Buarth Mawr Mr. A. W. S. Cross, architect, 46, New Bond Street, London, W. Quantities by Mr. W. Windsor, 37, Brown Street, Manchester:—

I WANT TO GIVE YOU A BETTER POSITION AND BETTER PAY.

I know I can do this for you by our successful system. We give you the right training to enable you to leave the overcrowded and poorly-paid trades, where the supply always exceeds the demand, where the unemployed question is prominent, and enter the paying and up-to-date profession of Electrical Engineering. We have done this for thousands, and can do the same for you. We train you by post, in your spare time, direct to your home, and at little cost to yourself.

I SEND YOU FREE

our interesting book, "How to Become an Electrical or Mechanical Engineer." It tells you the story of success in life, and gives you convincing proof that I will carry out what I state. We train you in Electrical Engineering, Electric Tramways, Electric Light and Power, Dynamo Tenders, Mechanical Engineering, etc., etc.

Don't miss this opportunity—it is too good to lose—but write to-day for this free book to SECRETARY,

At the Alpine Gallery. In the present exhibition of R.I.B.A. students' work at the Alpine Club two men hold paramount place, the one by reason of the excellence of his draughtsmanship and his design, and the other for the beauty of his colouring and composition. Mr. Walter S. George's Soane Medallion design embodying the mansion described in Bacon's essay "Of Building" will be generally admitted to be far and away the best of all sent in; a design, indeed, permeated with the spirit of the Elizabethan day to which it properly belongs, and a design moreover rendered by most artistic and suggestive draughtsmanship. We do not say that such draughtsmanship should be followed generally, but in this particular case the building was one belonging to John Thorpe's time, and we think it a very happy adaptation for Mr. George to have copied that quaint architect's manner. The other outstanding exhibitor is Mr. Charles Gascoyne, whose studies for the Owen Jones Studentship are excellent and delightful examples of colour and composition. He has in every case endeavoured to give a sort of mystery to his subject; and though maybe in some cases no such mystery attaches to the original, we are only now considering his studies as studies and not as absolute transcripts. For

the rest of the exhibition we can only say that there is not very much that calls for appreciative comment. The bulk of the Soane designs are, to our mind, altogether in the wrong strain, being more or less ingenious medleys of buildings by architects of to-day—town hall examples having evidently been a great source of inspiration. We exempt, however, the design by "Fraxinelle," the pencil drawing of which is very effective, though here one cannot help feeling that there is a mixture of the chateau of Pierrefonds, with a dash of Mr. Flockhart's Gothic and Mr. Guy Dawber's Gloucestershire dormers. Mr. Robert Atkinson's design, honourably mentioned, is certainly very well put together, and the pencil perspective of it is good, but here again there are strong reminiscences—this time of Hampton Court and Mr. Leonard Stokes. The Tite designs taken as a whole are poor. There seems to have been a very vague idea among competitors as to what was required. Some of them provide merely a colonnaded enclosure to a simple swimming bath, while others show two- or three-storey buildings of considerable magnitude. The majority of them are far too elaborate. Before leaving the Tite we cannot omit reference to the design of one competitor—a design in itself exhibiting much thought and ability, but rendered with a too vivid fancy in draughtsmanship. The scores of trees are so drawn that they give the place the appearance of a balloon ground, with the sun bursting through overhead like a shell over Ladysmith, while the clipped yews look like nothing else than so many mallets standing on their handles, and last but not least in the picture is an aged man toiling up a flight of seven steps—a hopelessly incongruous object.

The Office of Works under the new Government.

In accordance with British custom a change of Government involves a change of minister at the Office of Works, and Lord Windsor gives place to Mr. Lewis Harcourt. It is often said that our constitutional system "pitchforks" a politician into an office of whose working he is entirely ignorant, but, as a matter of fact, some of the most successful administrators of recent times—men like the late Mr. W. H. Smith—have found themselves at the head not only of departments but even of professions, and have acquitted themselves admirably. Lord Windsor will be remembered as a man sympathetic to architecture and the arts; Mr. Harcourt is a young statesman of great promise who has his spurs to win; and perhaps the public—in so far as they attend to the matter at all—and the professional and artistic world in a more special sense, will judge of both by their treatment of the Mall and its approaches, of Queen Victoria's monument, and of the vistas and grouping which the changes begun under Lord Windsor will produce. The Mall itself is for the

moment somewhat injured, but time and the growth of trees will restore it. It is important in all improvements in London to remember two very simple things, to wit, that England has an architecture of her own, and that London is not Paris. We yield to none in admiration of the stately streets which arose in the French capital forty years ago, and of the skilful planning and arrangement of their intersections and of squares and *ronds points*. But in dealing with the western part of the Metropolis, where the jurisdiction and influence of the Office of Works are mainly exercised, mere "Haussmannizing" is to be deprecated. Several foreign cities, notably Antwerp, have discovered to their cost that a *boulevard à vue infinie* has an empty unattractive appearance. It is possible to make a street too wide and a building too high for the best architectural effect. There is much in the present condition of London's architecture and London's traffic which calls for attention, for rearrangement and for completion, and none of the problems thus presented can be solved without the intelligent co-operation of public bodies, national and local, and the sanction and assistance of the Crown. We have at all times a monument among us of "how not to do it" in the familiar example of Hyde Park Corner, where, to ease the approaches to Victoria Station, the triumphal arch was set back at an angle and the equestrian statue removed. In a moment the buildings seemed to have run away to the horizon, a meaningless space was created, a new presentment of the Iron Duke—better in itself than its predecessor—was placed in the midst of it and lost, whilst the object of the change was not attained, as the daily "block" of vehicles and the enormous difficulties of foot traffic abundantly prove. This is one problem for a minister with taste and knowledge. His attention might also be given to the crowning of Decimus Burton's open colonnade, which gives access to the Park, with suitable groups of statuary. His labours, indeed, would not end here. The new Strand, now rapidly rising, must before long raise the question of the approach to Waterloo Bridge, which is Crown property and might be better treated architecturally than at present. And there are many other matters to which Crown officials could give attention. This is not the place to discuss styles and periods, but it is certain that historic Whitehall, now immensely affected by the new War Office, is destined to see further changes. Some of the buildings hereabouts are unworthy of the place and are only fit to be pulled down—dingy boxes of dirty brick with still dirtier windows. The question too of the width and alignment of the street where it enters Trafalgar Square will become a pressing one when the new entrance to the Mall is opened. Mr. Harcourt could hardly signalize his administration better than by the construction of a suitable gateway for the latter.

FIG. 1.—PITCH-PINE (*Pinus Palustris*), SHOWING ANNUAL RINGS.

FIG. 4.—TRANSVERSE SECTION OF OAK LOG SHOWING MEDULLARY RAYS.

THE CAUSES OF FIGURE IN TIMBER.

By H. Busbridge, A.R.I.B.A.

FOR the purposes of construction the value of any given kind of wood depends chiefly upon its strength, durability, ease of working and the facility with which it may be obtained in the market.

It sometimes happens, however, that in work where a beautiful effect is desired—for instance, in joinery and cabinet-making—woods are chosen more because of their colour or grain than for any other reason.

Broadly speaking, light-coloured woods are soft, whilst those of dark colour are generally hard and heavy. There are, however, a few exceptions to this rule, such as holly and boxwood, which, although pale in colour, are very hard and dense.

The prevailing tints among woods are white, buff, yellow, brown and red, nearly all shades of these colours being obtainable. Purples and greenish tints are rare, and blue is quite unknown, except as a stain caused by the action of fresh water upon the sapwood of coniferous timber.

Hardwoods owe their colour to the presence of some definite colouring matter or pigment which is generally more or less soluble in water.

Although many woods are prized simply because of their delicate or rich colour, the majority owe their value as ornamental or decorative materials to the "figure" or markings which appear in their grain.

Whenever the various parts of the wood differ from each other, either in colour or in structure, there will be differences in appearance which, if sufficiently pronounced, produce a more or less strongly-marked figure. Thus in the case of poplar the annual rings, although large and easily distinguished, are nearly uniform in tint, and the wood

consequently has scarcely any distinct figure; whilst in pitch-pine each annual ring consists of a pale yellow inner portion ("spring-wood") followed by a deep yellow outer portion ("autumn-wood") giving a distinct "grain" to the wood, conspicuous on all sections of it. If the trunk be cut transversely, as in Fig. 1, we have a series of concentric circular markings whose number at once indicates the age of the tree. A radial section (through the axis of the trunk)

The relative fineness or coarseness of the figure depends upon the thickness of the annual rings, and consequently upon the rapidity of growth of the wood; hence, slow-growing woods as a rule have little beauty of figure resulting from annual rings.

Whenever it is desired to obtain the best figure obtainable from this class of wood the tangential sections are preferred, and as a rule the beauty of the board increases with its distance from the centre of the tree, since the rings which appear in the middle of the board are of large diameter, and consequently wide stripes are produced.

Fig. 2, reproduced at the foot of this page, shows two methods of converting a log so as to obtain a large number of tangentially-cut boards.

Owing to slight irregularities in the annual rings, the markings produced on the surfaces of boards are never perfectly straight; and when cut very obliquely, as in the middle of tangential sections, the irregularities are emphasized in a manner which adds

greatly to the richness of the figure. Fig. 3—examples of yellow deal and Oregon pine—shows the effect of radial sections, the left-hand half of the yellow deal being sapwood; whilst the Brazil tulipwood and Carolina pine are typical examples of tangential sections. In Carolina pine each annual ring is partly pale yellow and partly deep yellow, whilst those of tulipwood are pale yellow irregularly marked with red.

Many woods owe their figure chiefly to what is termed "felt," "flower," "shingle" or "silver grain." The radiating lines which appear upon the transverse section of a log of oak (Fig. 4) are caused by medullary rays permeating the whole of the stem. All woods which have these rays large enough to be visible to the naked eye show the "silver grain" when the rays are cut obliquely, and the more nearly the direction of the section agrees with the direction of the rays the more of the figure will be seen. It follows that generally, in order to obtain the largest number of well-figured boards from an oak log, they should be cut as nearly as possible in a radial direction.

Fig. 5 shows the appearance presented by specimens of wood containing large medullary rays.

Of woods in common use, those characterized by distinct silver grain are oak, beech, horn-

FIG. 3, SHOWING FIGURE PRODUCED BY ANNUAL RINGS.

gives a number of parallel streaks of approximately equal width; whilst a section cut so as to touch one of the rings (a tangential section) gives a board marked with stripes which are widest at the centre and narrowest at the edge. An oblique section will give approximate ellipses, whilst a surface of double curvature cut in such wood gives streaks whose forms depend upon the inter-sections it makes with the approximately cylindrical surfaces of the annual rings.

FIG. 2, SHOWING TWO METHODS OF CONVERTING A LOG SO AS TO OBTAIN A LARGE NUMBER OF TANGENTIALLY-CUT BOARDS.

FIG. 6, SHOWING FIGURE PRODUCED BY KNOTS OR EYES.

beam and plane tree (or lacewood), whilst in many others, including elm, holly, sycamore, acacia and maple, it is quite visible, although not sufficiently pronounced to give distinct markings on the surface.

Another class of figuring owes its origin to the presence of very small knots or eyes. Wood marked in this way is known as "pollard wood." Since each knot or "eye" corresponds to a twig or shoot in the living tree, it follows that pollard wood can only be found in trees which throw out a large number of shoots. Some trees do this naturally, and their wood then becomes dotted with numerous small knots. More often, however—as in the case of pollard willows seen on the banks of country streams—the number of young shoots is increased artificially by lopping off each year's crop of shoots, in which case a new set of twigs is thrown out in the following spring, thus giving rise to another set of knots or eyes in the wood. We then obtain wood thickly set with knots, none of which are larger in diameter than a pencil. In this way pollard oak, elm, yew and other wood are produced. Fig. 6 shows a piece of pollard yew tree. Since the axes of knots generally radiate from the axis of the trunk, it follows that pollard wood shows to the best advantage in tangential sections.

The markings in bird's-eye maple are similar in appearance to the figure last described, but are due to small pittings which occur on the surface of the trunk of the sugar maple. On a surface tangential to the annual rings these pittings look very much like small knots, although rather less strongly marked, and they give rise to a very similar figure (see Fig. 7). As far as I know,

Bird's-eye Maple.

FIG. 7, SHOWING FIGURE CAUSED BY PITTINGS.

the sugar maple is unique in this respect, and it is highly esteemed for the beauty of its grain.

Logs of maple are generally converted so as to produce the maximum number of boards or veneers cut tangential to the annual rings, since it is only the tangential sections that exhibit this kind of marking to the best advantage. Sometimes veneers of this wood are cut spirally by taking a continuous circumferential cut from the surface of a well-figured log.

In most trees the surface of the wood just beneath the bark is slightly uneven owing to depressions and swellings. These often continue through several annual rings and then "die out," being compensated by the growth. Occasionally such prominences are caused by dormant buds, which then give rise to circlets

in tangential boards, sometimes seen in black ash and maple. The appearance of Hungarian ash, Devonshire elm, and the figured basswood (shown in Figs. 8 and 9) is due to such undulations in the surfaces of the annual rings.

Closely allied to this kind of figure is that obtained from the burrs or swellings which form upon the trunks of many kinds of trees. It appears that these excrescences are caused by parasitic insects which pierce the bark of the tree. In a continuous effort to repair the damage sustained, the tree adds new wood in successive irregular patches, until a considerable mass of woody tissues has accumulated. The burrs thus formed often attain considerable dimensions, a common size being 2ft. 6ins. wide by 12ins. thick, those of the best quality being exceedingly valuable for veneers, sometimes realizing as much as £50 per ton in the market. The most esteemed burrs for cabinet work are those of the Austrian, Italian and Turkey walnut tree (*Juglans regia*).

One other description of figure may be referred to. This is known as "wavy grain" or "curl." The effect is produced by small patches of "cross-grain" occurring at regular intervals throughout the substance of the wood. This cross grain arises when, instead of being truly parallel to the axis of the tree, the wood fibres arrange themselves in a spiral direction. In some trees it has been found that starting with an annual ring whose fibres are vertical, the ring formed next has its fibres slightly oblique; those of the next ring more oblique in the same direction, and so on, until a maximum deviation from the vertical is attained. After

Devonshire Elm (*Ulmus*). Australian Jarrah (*Eucalyptus Marginata*). Basswood (*Tilia Americana*). Hungarian Ash (*Fraxinus Excelsior*). E. India Satinwood (*Chloroxylon Swietenia*). Sycamore (*Acer Pseudo Platanus*).

FIGS. 8 AND 9, SHOWING FIGURE PRODUCED BY WAVY GRAIN OR "CURL."

this, the fibres of the successive rings gradually return to the vertical and then continue to deviate in the opposite direction, until a maximum is reached on that side, and so on. This oscillating process continues throughout the life of the tree, so that upon any vertical section of the trunk there will be a series of regularly recurring patches of "cross-grain" the character of which depends upon the individual character of the tree in which it occurs. This alternating spiral grain is found in cypress and eucalyptus trees, whilst Figs. 8 and 9 show the effect which it produces in sycamore and jarrah wood, the latter often exhibiting it to great advantage.

Another kind of grain known in the trade as "curl" is sometimes obtained by cutting veneer from the wood found at the base whence two branches separate.

A few woods occasionally used in cabinet work are irregularly marked with dark brown or deep red streaks or by mottling, giving rise to richly coloured figuring in choice samples. Among these may be mentioned tulipwood, zebra-wood, king-wood, snake-wood, rosewood, and some kinds of Spanish mahogany.

NOTES ON COMPETITIONS.

Greenwich Library.

If there are any who still hold misgivings as to the conduct of this competition on account of deposits having been returned before the result was announced, in spite of the explanation which was offered in this column last week to the effect that the action was due to official indiscretion, the information which it is now possible to give should allay all fears, for the assessor has made his award, and the envelopes containing the identity of the authors of the various designs have been opened in his presence. For the information of those who did not take part in this competition it may be stated that the subject was a branch library to be erected in London Street for the Metropolitan Borough of Greenwich, at a cost of £4,500 inclusive of fees, under the assessorship of Mr. A. W. S. Cross, M.A., F.R.I.B.A. The premiums offered were £25, £15 and £10 respectively, the first to merge in the commission payable to the architect. These premiums have now been awarded as follows:—The first to the authors of design No. 140, Messrs. Wills & Anderson, of London; the second to the authors of design No. 14, Messrs. Goldsmith & Son, of Manchester; the third to the author of design No. 11, Mr. H. A. Crouch, of London.

The conditions, instructions and particulars of competition were in themselves models of terseness and lucidity, but the report of the assessor to the libraries committee is a perfect example of all that such a report should be, dealing as it does with each individual design, and commenting upon its merits and demerits. The libraries committee have been advised that it should be available for perusal by the competitors, or others interested in the competition, during the public exhibition. Thus all who run may read; the devious paths through which the assessor travelled before arriving at his decision may be ascertained, and the reason why this design was selected and that rejected may be discovered by those that have eyes to see. This method of assessing is one which has been long urged by all desirous of having competitions conducted upon sound lines. Mr. Cross is to be congratulated upon putting an excellent principle into practice. Such a course is most instructive to successful and unsuccessful competitors alike, for by a careful study of the report each may see why and where he failed, or how his scheme might have been improved. His lesson learned, his next design for a similar subject should at least

be free from these defects, and thus the general standard would be raised and good would accrue to all, where otherwise mere disappointment had been the sole result. That the assessor's task was not a light one may be gathered from the fact that no fewer than 172 designs were submitted. Each of these designs is separately commented upon, the critical notes appearing in the report in the numerical order of the designs. A perusal of the report conveys the general impression that competitors failed for one or more of the following reasons:—Objectionable small internal areas; borrowers' counters which should have been recessed; reference library and staff-rooms upon the first floor; badly-planned entrances; bad supervision; no glazed screens between public apartments; caretaker's store-room badly placed; and wasted space. The universal adoption of the system of assessors' verbatim reports in all competitions, readily accessible to all competitors, should, as has been before suggested in these columns, go some way towards preventing the dissatisfaction often felt and expressed at apparently illogical awards. It might not remove it altogether, for even this system would not preclude the possibility of error. It would, however, provide the means of proving that an assessor's method of deduction had been wrong, and so he at least would be the better by a lesson. But perhaps that is why assessors are chary of making their reasons known.

Students' Competitions.

With the object of improving the competitions open to students of the Society of Architects, and of forwarding the cause of architectural education generally, the council of the Society has adopted the following recommendations of the committee appointed to report upon these subjects:—

(1) That the Society's silver medal and a travelling studentship of £25 be offered annually for competition among the students of the Society, under such conditions as may from time to time be announced.

(2) That an open scholarship of £10 per annum, tenable for three years at any architectural school or college, or to be used in furtherance of the holder's architectural education in some other manner approved by the Council, be offered for competition annually under such conditions as may from time to time be announced: the maximum age limit to be nineteen and the holder to be required to register as a student of the Society.

It will be noted that competition for the travelling studentship will be confined to those on the register of students of the Society, but that the scholarship is an open one and is intended to assist those who are just commencing the study of architecture with a view of adopting it as a profession. The regulations and conditions will be published in due course. In the meantime those who propose to compete for the travelling studentship would do well to apply for admission to the register of students without delay, so as to qualify for entry immediately the conditions are issued. Particulars may be obtained at the offices of the Society, Staple Inn Buildings, Holborn, W.C.

Central Library, St. Pancras.

The following architects have been selected to compete for the new central free library which is proposed to be built in the borough of St. Pancras:—Messrs. J. S. Gibson, Maurice B. Adams, E. Wimperis, Mallows & Cross, Russell & Cooper and Wills & Anderson. At last Wednesday's meeting of the borough council it was suggested that Mr. Henry T. Hare should be added to the list, but on the ground that the selection had been made by the president of the Institute by request of the borough council it was decided that the list should be accepted as it stood.

Cape Town Law Courts.

The important competition for new law courts to be erected at Cape Town has been decided as follows:—First premium (£500), Hawke & McKinlay; second (£300), Milne & Sladdin; third (£200), Baker & Masey—all of Cape Town. Mr. Mervyn Macartney, F.R.I.B.A., was the assessor. Messrs. Hawke

& McKinlay were the successful architects in the competition for the Cape University, their design for which was published in THE BUILDERS' JOURNAL for May 27th, 1903. This building is now being erected.

Competition for Bangor University College.

The Council of the University College of North Wales at Bangor will shortly invite a limited number of architects to submit competitive designs for the permanent buildings of the college. Architects who desire their names to be considered by the council in selecting their list should send particulars of work designed or executed by them—before March 1st next—to the secretary and registrar, Mr. John Edward Lloyd, M.A., from whom further particulars can be obtained.

LIVERPOOL ARCHITECTURAL SOCIETY.

IN a paper on "Architects and the Improvement of Cities" which he read before last week's meeting of the Liverpool Architectural Society Mr. T. T. Rees, F.R.I.B.A., drew attention to the need for wide streets. Bidston Road, Birkenhead, he said, might serve as an illustration of modern tendencies. It ought to have been twice the width, with a tree-planted footway in the centre, like Prince's Road, Liverpool. Every street over 50ft. wide in the crowded parts of a city ought to be planted with trees, and no new streets should be less than 50ft. wide. The corporation should have power to insist on streets being continuous, and not blocked by an arbitrary landowner. Having contended for the more systematic cleansing of streets, and for the abolition of overhead wires, the lecturer proceeded to advocate land purchase by municipalities on their borders. The pioneer action of the Prussian Government in this respect should be followed. Municipalities ought, of course, to supervise and control private restrictions as to building, thus preventing the deterioration of property. Having commended the gift to Liverpool by Alderman W. B. Bowring of the Roby Hall estate, and extolled the former wisdom of Birkenhead in buying its cheap park, he expressed a desire to see Sir Joseph Paxton's beautiful designs for that park carried fully into effect. Contrasting Hamilton Square, Birkenhead, and St. John's Gardens, Liverpool (the "Stoneyard"), he praised the simplicity and effectiveness of the former to the disadvantage of the latter. The Continental principle of placing important buildings on prominent sites required greater study in this country. Moreover, England lacked the Continental censorship of hoardings and posters. Chicago permitted no hoarding in a residential street without the consent of three-fourths of the inhabitants. Edinburgh had obtained power for its corporation to licence positions for mural advertisements. The advertisements around the Queen Victoria Memorial in Liverpool had proved a sore trial to the nerves of many.

Law Cases.

A Slating Accident: Liability for the Supply of Tackle.—At the Bromley County Court recently a slater named Whitcher sued Messrs. J. Knowles & Co., slaters and tilers, of Bromley, for £50 damages for personal injuries resulting from an accident which occurred, it was alleged, through defective tackle supplied by the defendants—a cord having snapped whilst Whitcher was pulling up some cripples on the roof, causing him to fall 25ft. Whitcher, who was stripping and recovering the roof of a barn, took the job as piece-work at so much per square and as subcontractor to Messrs. Knowles.—In summing-up, the judge said the question was whether there was any evidence of personal control by

NEW FONT, ALL SOULS' CHURCH, LOUDOUN ROAD, HAMPSHIRE.
NICHOLSON AND CORLETTE, ARCHITECTS.

the defendants. He found there was no such evidence. It was part of the agreement that the defendants should supply tackle; that was, no doubt, important, but it did not make them employers, and it did not bring them within the meaning of the words of the Act. He was sorry for the unfortunate plaintiff, but it was his duty to dismiss the action, and he did so without any order as to costs.

PAYMENT OF DISTRICT SURVEYORS BY SALARIES.

ON December 19th last the Building Act Committee of the London County Council submitted a report giving full details of a scheme which they proposed to recommend for the payment of district surveyors by salaries, instead of fees, in connection with a model scheme for the ultimate rearrangement of district surveyors' districts. The report, after having been postponed, was before the Council yesterday, the Building Act Committee recommending that the scheme should apply as and from April 1st next, and that the salary of each district surveyor should be equal to the amount of the average of the fees received in his district during the seven years ended December 31st last, as provided in section 158 of the London Building Act, 1894.

Finance Committee Sceptical.

The Finance Committee of the Council also submitted a report on the matter. They stated that during the seven years ended 1904 the average annual receipts of district

surveyors from fees amounted to £50,748, that (with the exception of one year) there was a continuous increase in the fees received, and that in 1904 the fees amounted to £52,932. "It would therefore appear that in the event of the Council deciding to exercise the powers conferred by the section the salaries to be paid to the district surveyors would, assuming that the figures for the year 1905 shall be found to follow the upward tendency of recent years, result in a balance in favour of the Council of upwards of £2,000 a year.

"The proposal of the Building Act Committee, however, is not limited to the substitution of salaries for fees on the basis of the section above referred to. The more important part of their proposal is to institute a model scheme, to be brought into operation gradually as circumstances permit, under which the Council, instead of paying salaries covering all the expenses of the district surveyors for assistance, office accommodation, &c., should pay to each a nett salary, and in addition the salaries of any necessary assistants, the cost of offices, &c. The Committee state that owing to the fact that there are now several vacant districts, and that other vacancies are likely to occur in the near future, the present time is opportune for the Council to make any such change of system as is proposed.

Re-division of Districts.

"The Building Act Committee state that, in the event of the model scheme being adopted, the total annual cost of the service would ultimately be reduced to about £40,245, and that there would thus be an

increased margin to secure the Council against loss by shrinkage of fees, &c. The model scheme provides for the division of London into thirty-three districts instead of fifty-seven as at present, and it is indicated that the salaries of the district surveyors would be £1,000, £800 or £500 a year in accordance with the importance of the district. It is proposed that in all but two of the sixteen districts where the salary is to be £1,000 there shall be one or two professional assistants, and, in one case, three assistants at a uniform salary of £200 each. In the other two districts, and also in the eleven districts at £800, and the six districts at £500, no assistant is proposed. Every surveyor is to be provided with a boy clerk at the rate of pay of 15s., rising to 25s. a week, and allowances for office expenses are suggested at £150 or £200 a year according to the district."

The Finance Committee reported that they were not in a position to judge whether the suggested amount of professional and clerical assistance was sufficient, "but having regard to the fact that it is proposed that the district surveyors shall collect the fees which will in future be receivable on behalf of the Council, it will be necessary for their accounts to be kept in such a manner as to be easily examined and audited by the Council. We have therefore considerable misgivings whether the provision for staff will be found to be adequate.

Office Expenses.

"With regard to office expenses, we feel that as soon as district surveyors became the salaried officers of the Council, there would be a tendency to regard many of the present offices as unsuitable, and to secure more expensive accommodation in prominent positions. We are, moreover, advised that, in the event of district surveyors being paid by salaries, the Council will probably have to provide them with more legal assistance than at present, and the cost of taking any necessary proceedings for recovery of fees would also fall upon the Council, the increase of expenditure for this additional legal work being estimated at from £300 to £500 a year, for which no provision has been made in the above-mentioned estimate of £40,245. We are informed by the Building Act Committee that the cost of furnishing the thirty-three offices comprised in the model scheme would involve additional expenditure, not included in the estimate, of £950, but this of course would only occur once, namely, on the establishment of new offices.

"We are very doubtful whether the model scheme could be carried out except at a cost considerably in excess of the estimate of the Building Act Committee.

"As regards the receipts, we are of opinion that the mere adoption of a salary system would remove some of the incentive at present existing to the discovery by district surveyors of cases under the Building Act in respect of which fees are payable, and would probably lead to a diminution in the total fees recovered; and we are by no means satisfied that when all the available vacant land in the county shall have been built upon, the present upward tendency of the total fees received might not, in the normal course of events, be replaced by a downward tendency."

Architect M.Ps.—Mr. T. B. Silcock, of the firm of Silcock & Reay, architects, of Bath, has been elected M.P. for the Wells division of Somerset; Mr. J. E. Sears, architect, London, M.P. for Cheltenham; Mr. A. C. Morton, architect, London, M.P. for Sutherlandshire; and Mr. A. W. Soames (trained as an architect and formerly in practice as such) M.P. for South Norfolk. Mr. Philip E. Pilditch, architect, London, was not elected for St. Ives, nor Mr. William Hunt, architect, London, for South Islington.

THE AMERICAN CEMENT INDUSTRY.

Its Wonderful Growth.

FROM figures published by the United States Geological Society the growth of the American cement industry within the past few years is seen to be very considerable. Only a very few years ago, says "Engineering," the output of cement in the United States was quite insignificant: in fact, there hardly was any output at all, nearly the whole of the cement used coming from abroad. But now the country itself supplies a very large proportion of the cement it uses. In 1900 the value of the three classes of cement—Portland, Natural and Puzzolana (slag)—manufactured in the States was £2,656,700, while in 1903 it was £6,386,270, or an increase in three years of about 140 per cent. Nearly the whole of this increase was in Portland cement; for although the output of Puzzolana increased about 100 per cent. the total amount manufactured was small in comparison with Portland.

"It will be seen from the preceding figures that the position held by Portland cement as an industrial product is vastly superior to that occupied by either the natural product or slag cement. This is as one would expect, for the uses to which both the natural and the slag cement can be put are limited when compared with Portland cement . . .

A Comparison between Portland and Natural Cements.

"As is well known, Portland cement differs in many ways from natural cement. In the first place, it is produced in quite a different way, by a method much more complex and exact; and, secondly, its characteristics are more important. Moreover, Portland cement is a definite product, its percentages of lime, silica, alumina and iron oxide varying between narrow limits, while brands of natural cements vary greatly in composition. The temperature at which Portland cement is burned is much higher than that required for natural cement, the temperature necessary for the former being somewhere near 3,000 degs. Fahr., while for the latter it may never approach the fusing or clinkering point. Portland cements are heavier than natural cements; they also set slower and attain a

higher tensile strength. In many ways the composition of the two is similar, though in the case of one its constituent parts are of lime, silica, alumina and iron oxide artificially mixed in certain definite proportions, while in the other they are burned in the state in which they are found in Nature.

Natural Cements.

"In the natural cement manufactured in the United States a clayey limestone is invariably used which has from 13 to 40 per cent. of clayey matter, from 10 to 22 per cent. of silica, and from 4 to 16 per cent. of alumina and iron oxide. The presence of magnesium carbonate in a natural rock is regarded as merely incidental, where, for natural cements at least, it takes the place of lime as far as the hydraulic properties of the product are concerned.

Slag Cements.

"In the Puzzolana cements the required properties are made by mixing powdered slaked lime with either volcanic ash or blast-furnace slag, the product being simply a mechanical mixture, which is not burned at any stage of its manufacture. The Puzzolana cements are more suitable for setting under water than in air.

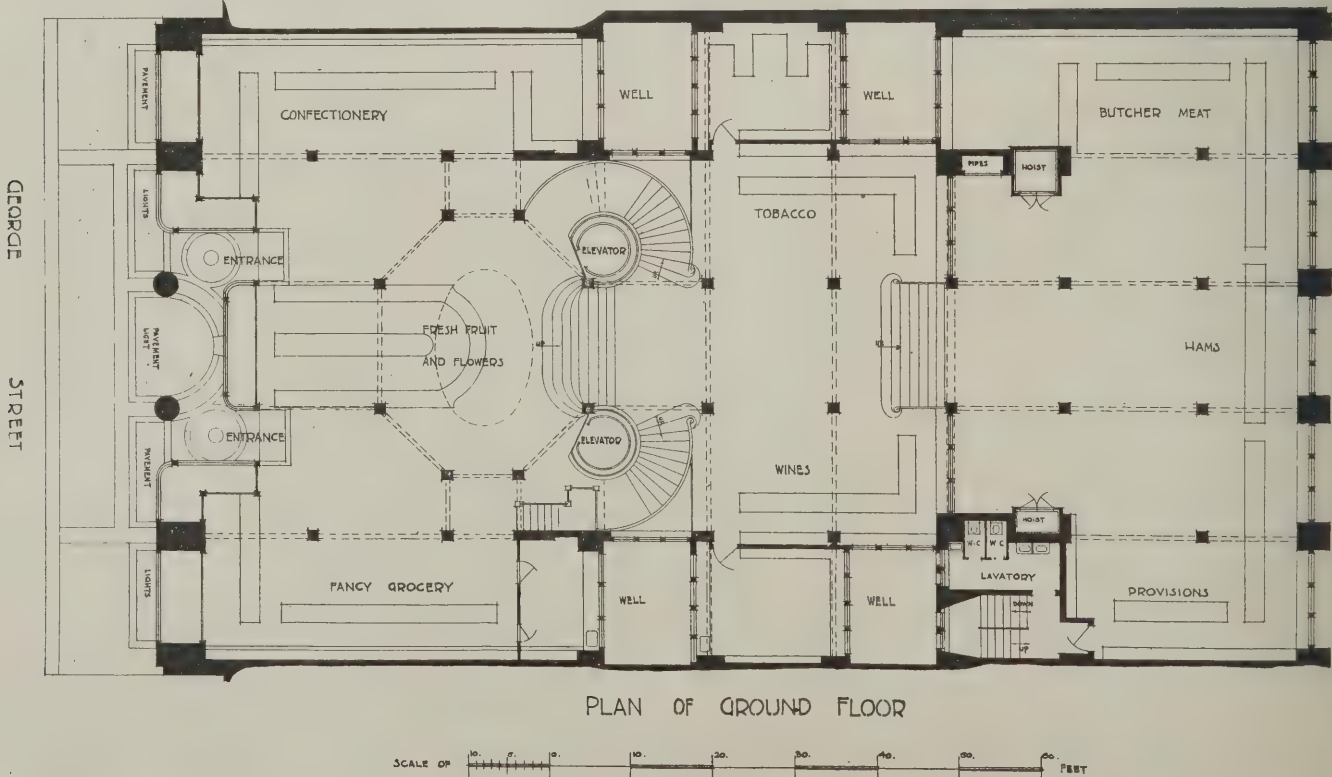

"These slag cements are lower in specific gravity and lighter in colour than Portland cements; normally they set more slowly, though this can be overcome by treatment during manufacture. They do not very well resist mechanical wear, and in dry situations they do not set in a satisfactory manner. Under water or in permanently damp situations they are, however, useful."

An Architectural Attaché is being appointed to the German Embassy in London to study and report upon working-class dwellings in this country. In the matter of such dwellings Berlin (as, indeed, all large German towns) is astonishingly backward, and some well-ordered scheme for the housing of the growing population is becoming increasingly necessary. In connection with the above appointment it may be recalled that from 1896 to 1898 there was attached to the German Embassy in London an architectural expert to report upon our public buildings and the means of transit between the Metropolis and the suburbs.

OUR PLATES.

THE new Dental Hospital in Great Charles Street, Birmingham, was opened by Sir Oliver Lodge last July. The cost has been about £10,000 altogether, allowing £8,500 for the building and £1,500 for its equipment. It is built of red bricks with stone dressings, and provides the following accommodation:—On the ground floor a general waiting hall, staff rooms, classroom, students' room and museum; on the first floor a lecture hall and rooms for operations (with and without anæsthetics), and recovery rooms; on the second floor filling and saving rooms, specially lighted; and on the top floor a mechanical department and workroom for the making of artificial teeth and crowns. Messrs. Bateman & Bateman, of Birmingham, were the architects.

The new building in George Street, Edinburgh, for the Professional and Civil Service Supply Association was completed towards the end of last year from designs by Messrs. John Burnet & Son, architects, of Glasgow. The frontage to George Street is about 80ft. and the depth of the building about 145ft. In all there are eight floors, namely, sub-basement, basement, ground, entresol, and four floors above. The general refrigerating department, with wine cellars and refrigerators, occupies the sub-basement; the grocery storage and despatch department the basement, with four van entrances in Ros Street Lane; the grocery and provision department the ground floor; clerical department on the entresol floor; drapery and tailoring departments on the first floor; drug, stationery and boots departments on the second; ironmongery and furniture on the third; and a restaurant and tea-room on the top floor. The front of the building is constructed of Prudham white sandstone, enriched on the lower floors with white and green marble. The main contracting work—masonry, brickwork, ironwork, slating, plasterwork, plumbing and glazing—was carried out by Edinburgh firms; the refrigerating installation by Messrs. J. & E. Hall, Ltd., of Dartford; passenger and goods lifts by Messrs. Archibald Smith & Stevens, of London; and "Fram" fire-resisting floors throughout by the "Fram" Fireproofing Co.

Notes and News.

Mr. T. M. Cappon has been instructed to prepare new plans for the Westgreen Asylum, Dundee, together with Gowrie House.

Mr. J. T. Cackett's Presidential Address to the Northern Architectural Association, delivered on November 22nd last, has been reprinted as a pamphlet from the R.I.B.A. Journal.

An Austrian Exhibition of Architecture and Building Construction is proposed to be held in 1908 in the Vienna Prater. Although the exhibition will be mainly an Austrian one, foreign nations will be invited to participate.

The Society of Architects has subscribed £700 towards the expenses of the Seventh International Congress of Architects to be held in London in July next—in the Grafton Galleries, Bond Street—and has appointed twelve delegates to represent the Society at the Congress.

A new School at Abingdon, dedicated to St. Helen and brought into being by the community of St. Mary the Virgin—the Wantage Sisters—has been built on the Shippon Road at a cost of £30,000 from designs by Mr. Frank L. Pearson, F.R.I.B.A. Accommodation is provided for 40 boarders and 200 scholars.

The L.M.B.A. Diary and Handbook for 1906 has just been issued from the offices of the London Master-Builders' Association, 31 and 32, Bedford Street, Strand, price 2s. 6d. It preserves the form hitherto adopted, including with the diary a collection of notes as to wages, lists of members, rules, memoranda, &c., and a glossary of electrical terms.

The Architects', Surveyors' and Auctioneers' Diary and Almanac for 1906, issued by Waterlow Brothers & Layton, Ltd., 24 and 25, Birch Lane, E.C., price 6s. (also 3s. 6d.), has come to hand. In addition to a very ample diary, it provides a great deal of information and memoranda of use to architects and others, including lists of members of the R.I.B.A., the Society of Architects, the Surveyors' Institution, the Institution of Civil Engineers, the Auctioneers' Institute, &c., together with the London Building Act, house agreements, &c.

An Interesting Letter about Carron Stoves has been sent to us by the Carron Co., of Carron, Stirlingshire. It is from a Mr. W. Waller, at Whitewood, North-west Territories, Canada. He says: "I was on a business trip this fall in the north-east part of Saskatchewan; saw a box-stove of what I thought was a new design in box-stoves. On enquiring where the man got it, he said it was his great grandfather's, and that it was made by the Carron Co. 150 years ago. I thought it most extraordinary for a stove to last that length of time. The stove belongs to the early settler's family that came out with Lord Selkirk." This speaks wonderfully well of the lasting qualities of Carron manufactures.

At the Birmingham Builders' Exchange the following lectures are to be delivered on Thursday evenings:—February 1st, "The Underground Slate Quarries of North Wales," by Mr. H. Browning Button. February 15th, "The Housing Problem," by Mr. F. G. Whit-tall, president of the Midland Centre of the National Federation of Building Trade Employers. March 1st, "Architectural Ceramics," by Mr. J. Miller Carr. March 15th, "Talks on Canadian Cities," by Mr. Peter B. Ball, resident agent for the Commercial Agency of the Government of Canada. March 29th, "The Goldfields of the City," by Mr. W. Francis Goodrich, an authority on the disposal of waste. The lectures will commence at 6 p.m.

The London County Hall Bill has been ordered for first reading.

A new Church at Boness has just been completed from designs by Messrs. Scott & Campbell, of Edinburgh, at a cost of £6,000. The seating capacity is for 600.

New Members of the Royal Sanitary Institute include Mr. Percy E. Nobbs, professor of architecture at the McGill University, Montreal, and Mr. Heaton Comyn, A.R.I.B.A.

A Book on Bourneville—Cadbury's model village outside Birmingham—has just been published by Mr. Batsford, price 8s. It is admirably illustrated. The author is Mr. Alexander Harvey, architect to the estate.

Fifty Years of English Renaissance.—At last Thursday's meeting of the Sheffield Society of Architects and Surveyors, Mr. C. F. Innocent, A.R.I.B.A., delivered a lecture on "English Renaissance Architecture, 1650 to 1700," the third of a series.

The Furniture for the King's Sanatorium, now being completed at Midhurst, Sussex is being supplied to a special design by Messrs. Heal & Son, of Tottenham Court Road. It is called "Aseptic," and is white enamelled and free from all mouldings and other lodgments for dust.

Tower Bridge Police Court and Station.—The mosaic flooring in the entrance hall of this building, illustrated in our issue for last week, was executed by Messrs. Diespeker, Ltd., of 57-60, Holborn Viaduct, who have also carried out similar floorings in the police courts at Shoreditch and King's Cross under the same architect.—Mr. J. Dixon Butler.

Dissolutions of Partnership.—Mr. Humphreys-Davies and Mr. W. C. D. Cruttenden, hitherto practising as architects under the style of Messrs. Humphreys-Davies & Co., architects, London, E.C., have dissolved partnership.—Messrs. W. E. Fenwicke and O. L. Smith, practising as architects at Newcastle-on-Tyne under the style of Dunn, Hansom & Fenwicke, have also dissolved partnership.

Messrs. Patman & Fotheringham, Ltd., of Theobald's Road, W.C., and Islington, N., have secured the contract for the rebuilding of Nos. 132, 133, 134 and 135, Long Acre, W.C., destroyed recently by fire. The architect for the work is Mr. William Woodward, F.R.I.B.A. These premises when completed will be used for very large motor warehouses.

Building Accidents.—On Wednesday evening last the copings of four shops facing the London County Council's school in Akerman Road, North Brixton, fell into the street, killing one boy and seriously injuring another.—On Thursday a serious accident occurred in a large reservoir which is being constructed by the South Staffordshire Waterworks Co. at Shavers End, Sedgeley. A scaffold gave way, and eight men fell nearly 20ft., two sustaining serious injuries. The cause of the accident is said to have been the slipping of the ropes by reason of their being saturated with the heavy rain.—A granary floor collapsed on January 21st at the Bradford corporation stables in Harris Street. Luckily, no one was killed, but three men were injured.

Bedford Estate Scheme Adopted.—At last Wednesday's meeting of the Holborn Borough Council the report of the works committee in regard to new streets, &c., on the Bedford estate was adopted, subject to the Duke of Bedford contributing £2,000 towards the expenses of paving, &c., and allowing for the use of the old materials of the demolished houses for levelling purposes. The scheme involves the closing of Torrington Mews, the widening of Kepple Mews North, the construction of a new street on the site of Kepple Mews South, and the widening of Torrington Place, from Torrington Mews, westward from 50ft. to 60ft.

A new Theatre at Scarborough is to be built in Queen Street. The building will seat about 1,500 people.

Six new Schools at Bootle are proposed to be built by the Bootle Education Committee, one for 750 children and the others for 1,000 children each.

The Holborn Empire, formerly the Royal Music Hall, was opened on Monday. The house has been transformed under the direction of Messrs. Frank Matcham & Co., the well-known theatre architects.

South Wales and Monmouthshire Architects' Society.—Mr. H. Dare Bryan, F.R.I.B.A., of Bristol, read a paper on "The Evolution of the English Cathedral" at last week's meeting of this Society, held at Cardiff.

The new Carnegie Library at Harrogate was opened on Wednesday last. It is built on the town hall site. The reading-room is 50ft. square and the lending department will hold 15,000 volumes. The cost, including furnishing, has been about £8,000. Mr. Henry T. Hare, F.R.I.B.A., was the architect.

Newport Borough Asylum.—This building was opened on Thursday last. It is situated at Caerleon and has been built from designs by Mr. A. J. Wood, of Surrey Street, London, W.C. The total cost will be about £155,000. Accommodation is provided for 368 patients with administrative offices for 500 patients, thus making provision for two further patients' blocks without any enlargement of the administrative block. The contractors for the work were Messrs. John Linton & Co., Ltd., of Newport.

The new Church of St. Michael and All Angels at Manselton, Swansea, was consecrated by the Bishop of St. David's on Wednesday last. The nave is 72ft. long by 25ft. wide; north aisle and south aisle each 72ft. long by 20ft. 6ins. wide; and chancel 36ft. by 25ft. The accommodation is for 700 people. The portion of the church already completed has cost £5,000. Mr. E. M. Bruce Vaughan, F.R.I.B.A., of Cardiff, was the architect, and Messrs. Lloyd Brothers, of Swansea, were the contractors.

A Definite Arrangement about Ayr Bridge has now been arrived at. Provided the sum believed to be necessary, namely, £10,000, is obtained by August 1st next, a committee (to be appointed at a public meeting in Ayr) will be allowed to carry out the necessary preservative works on the bridge, after the plans have been approved by the burgh surveyor in the interests of the public safety. The whole work must be completed by August 1st, 1908. Should it be necessary to rebuild any portion of the old bridge, the cost of such rebuilding will be borne out of the Templeton bequest funds. If the amount of £10,000 is not raised by public subscription, the town council of Ayr will instruct the surveyor to proceed with the rebuilding of the bridge.

Ancient Building Construction.—Lecturing on this subject at the Manchester Municipal School of Technology last Wednesday, Prof. S. H. Capper described how the huge blocks of stone used in the construction of the great Egyptian temples were brought across country and placed in position by means of a series of inclined planes, being dragged down one slope, raised by leverage to the top of another, dragged down the second slope, and so on. Professor Capper also described and illustrated the probable method used in erecting the huge statues, some of which were 52ft. high and weighed nearly 1,000 tons. In one case there were inscriptions and evidences to show that a colossal statue, carved out of one solid piece of granite, was brought down the river to the place where it was to be erected resting on eight pontoons or rafts, dragged by 15,000 men, who pulled at ropes 1,000ft. long.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Strength of Rib Truss.

DORSET.—E. J. B. writes: "I send rough tracing of the arched principal for a roof to be covered with lead. The principals are of English oak. Do you consider the construction satisfactory without a tie-rod? Is there a possibility of the principal spreading and thrusting-out the walls?"

The truss shown by querist and reproduced herewith with alterations, namely, larger bolts and outline buttress (as Fig. 1) offers a very important case, and one that does not lend itself readily to the ordinary methods of solution; an attempt has therefore been made in the following notes to substitute a braced structure within the same dimensions and from that to obtain an analysis of the stresses. The roof naturally divides itself into two portions (see Fig. 2), which may be assumed to be pivoted at the apex. It will be seen that the loads and reactions form two couples acting in opposite directions, and the first thing to determine will be the moments of these couples. The loads 1-2, 2-3, 3-4 and one-half of load 4-5, making a total of $8 + 16 + 16 + 8 = 48$ cwt., are equal to and balanced by the reaction 9-1a of 48 cwt. The moment of the first couple consists of load 1-2 of 8 cwt. acting without leverage = 0, load 2-3 of 16 cwt. with a leverage of 7.5 ft. = 60, load 3-4 of 16 cwt. with a leverage of 7.5 ft. = 120, and one-half of load 4-5, or 8 cwt., with a leverage of 11.25 ft. = 90; making a total of $0 + 60 + 120 + 90 = 270$ cwt.-ft.; or this moment may be obtained by multiplying the reaction of 48 cwt. by 5.625 ft., which is the mean arm of the couple, $48 \times 5.625 = 270$ cwt.-ft. This is balanced by the moment of the forces 1-1a and the horizontal thrust at the crown, which will be the same moment acting with a leverage of 9 ft. Therefore force 1-1a = $\frac{270 \text{ cwt.-ft.}}{9 \text{ ft.}} = 30$ cwt.

The load line 1 to 8 (Fig. 3) may now be drawn. Then for 1-1a set out 30 cwt. to scale from 1, and for 8-8a set out 30 cwt. from 8; join 1a to 8a, and the point 9 will be midway between the two extremities. The remainder of the stress diagram may then be completed without further difficulty. The nature and amount of the stresses as scaled from Fig. 3 are marked on Fig. 2, where also thick lines denote members in compression and thin lines those in tension. For the stresses on the principal rafter the method of working is as follows:—Draw AB (Fig. 4) equal to the horizontal span of rafter = 11 ft. 3 ins., and add the loads from the purlins at c and d. Then the bending moment due to load c will be

$$w_{ab} = \frac{16 \times 3.75 \times 7.5}{11.25} = 40 \text{ cwt.-ft., or } 40 \times 12 = 480 \text{ cwt.-ins.}$$

Setting this down as CE and a similar amount from D giving DF, then adding CG to CE and DH to DF, CJ and DK are obtained, and joining AJKB the outline of the bending moment diagram is found, the maximum bending moment being anywhere between CJ and DK and

equal to 720 cwt.-ins. The formula $\frac{w}{A} \pm \frac{M}{Z}$

may now be used, where w is taken as the stress in bar 6-17 = 57 cwt., A the effective sectional area of the rafter taken as 9 ins. \times 6 ins. owing to the underside being moulded,

the maximum bending moment = 720 cwt.-ins., and $z = \frac{bd^2}{6} = \frac{6 \times 9^2}{6} = 81$. Then

$$\frac{57 \pm \frac{720}{81}}{996} = 1.06 \pm 8.9 = 9.96 \text{ cwt. compression per sq. in.; and taking oak as crushing with } 3.2 \text{ tons per sq. in. (as given by Hurst), } \frac{3.2 \times 20}{996} = 6.4, \text{ say a factor of}$$

safety of 6. For the stability of the wall the height from ground level to level of corbel has been assumed as 6 ft. (as shown in Fig. 5). For the weight of wall, 8 ft. long \times 14 ft. total height $\times \frac{1}{2}$ ft. thick \times 144 lbs. per cub. ft. \div 112 lbs. in 1 cwt. = 120 cwt., and 120 cwt. + 48 cwt. vertical load from truss = 168 cwt. acting vertically down the wall. Combining this with the outward thrust of 30 cwt., the resultant cuts the face of the wall at a height of 3 ft. 8 ins. above the base, so that the wall is not sufficiently strong, and buttresses will have to be used. Assuming a buttress 18 ins. by 3 ft. wide on face (as shown in Fig. 6, plan, and Fig. 7, elevation), then the additional weight to be added for the buttress will be 3 ft. \times 1 ft. 6 ins. \times 8 ft. high \times 144 lbs. per cub. ft. \div 112 lbs. = say 46.3 cwt., making a total vertical weight of $168 + 46.3 = 214.3$ cwt. Setting this down through the centre of gravity of the section of wall and buttress, and combining with the horizontal thrust of 30 cwt. the resultant when produced cuts the base of the buttress at a distance of 8 ins. from the outer edge.

Then $\frac{2}{3} \frac{W}{d} = \frac{2}{3} \times \frac{214.3}{8.12} = 95.25$ cwt. = say $4\frac{1}{2}$ tons per sq. ft. maximum compression on buttress. The 4 ins. inside brick-lining to stone wall has not been taken into account in the above calculations for stability as it practically adds nothing. HENRY ADAMS.

Liability for Re-making of Roads.

MONKWEARMOUTH.—J. E. writes: "Twenty-five years ago a public corporation prevailed upon the commissioners and landowners to give up many acres of land for a park and to form roads adjacent to same. This was done in macadam to the corporation specification, and under their inspection these roads have been lighted, cleaned and repaired up to the present at the expense of the ratepayers. Now the corporation give notice to the owners of houses adjacent to these roads to re-make them in pursuance with the Public Health Act, 1875, and claim that they have never taken the roads over. Do you know of any House of Lords' decision whereby a public authority, having maintained and cleaned a road and collected the borough and district rates from the adjacent owners, can compel the owners to make good what has been destroyed by the public at large?"

In the absence of any other material facts than those before me, such as a local private Act of Parliament, the corporation appear to have absolutely no case whatever in support of their claim. A presumption of dedication arises from the maintenance and repair of the road in past years by the corporation. The corporation after repairing, &c., for twenty years are not entitled to say that they have not taken it over, even if certain technical formalities have not been observed in regard to dedication. The courts would have scant sympathy with the corporation if they tried to make the donors of a public park, &c., liable in such a case as this. I should advise the owners to place the matter in the hands of an experienced solicitor with instructions to resist the demand until they showed a better right than they appear to have. I am unable to find any recent decisions in point. S. P. J. M.

Hot-water Supply Arrangements.

BRISTOL. — CONSTANT READER writes: "Kindly give me a few particulars on heating by hot water. I should like to know whether a circulating cylinder fixed as sketch (not reproduced) will work satisfactorily. My flow and return are $1\frac{1}{2}$ ins. and the draw-offs $\frac{1}{2}$ in., and I have a long way to carry my pipes. Which is the right position to attach them? Please also give me the names and prices of authoritative books on this subject."

The sketch reproduced above will give you an idea of how the work can be done. A special cylinder may have to be ordered, and its ends had better be dome-shaped, with a pipe connecting to each. The pipe from the top side should be $1\frac{1}{4}$ bore right to the end in the cold-water cistern, which must have enough space in it when full of cold water to hold a few gallons of hot. The cylinder will work as well horizontally as vertically. If a draw-off tap be more than 20 ft. from the main hot-water pipe, a return pipe should be fitted, as shown on the left-hand side of the sketch. If cost be an obstacle, the return pipe need be only $\frac{1}{2}$ in. bore. This extra pipe completes the circuit of flow and return, and brings about a continuous flow of hot water in the main hot-water pipes; every tap then lets off hot water at once. The circuit, or the ring as it may be called, can sometimes be made by connecting the ends of two branch pipes. The best book on the subject is, perhaps, Mr. Walter Jones's "Heating by Hot-water, Ventilation and Hot-water Supply," price 6s.; but you will find much information on various methods of heating buildings, hot-water supply and ventilation in "Specification" No 9, price 2s. 6d., shortly to be published. In any case, you must keep records of your work by noting the amount of hot water drawn off and the total amount in boiler, pipes and reservoir; the amount of heating surface in the boiler, the area of the fire-grate and the weight of fuel burnt; also the temperatures of the cold water and of the hot water drawn off.

O. WHEELER.

Load on Roof Truss.

CARDIFF. — STUDENT writes: "For my study of iron roof construction I am using some of Prof. Henry Adams's building construction plates. On one, illustrating stress diagrams for iron roofs, he says ' $\frac{1}{2}$ cwt. per ft. super. of actual surface is sufficient to allow for

all contingencies.' Does this include wind-pressure, or is it only dead load? If it does not include wind-pressure, can you tell me the simplest method of obtaining the live load, say, for a roof of 35 degs. pitch?"

The $\frac{1}{2}$ cwt. per ft. super. is sufficient to allow for weight of truss, covering, wind-pressure, snow and other contingencies on straight rafter roofs; but when a braced "sickle" or "crescent"-shaped iron roof truss is in question it is necessary to take account of the wind separately, as the stresses may vary from tension to compression in some of the members, and due allowance must be made for them.

HENRY ADAMS.

Boiler Flue in Floor.

LONDON. — C. L. G. writes: "In a block of flats I am constructing the hot water is supplied by a vertical boiler in the basement. The position of the boiler is shown on sketch (not reproduced). The flue has to be taken to a shaft at A, the distance between boiler and A being about 15 ft. The question is, can I place the flue before the level of the basement floor? Would it be liable to be choked by soot, or could this be obviated by (say) a pit for collecting purposes? For several reasons the flue cannot pass under the floor above."

This will work satisfactorily if the flue rises all the way from the down pipe to the chimney. The slope should not be less than that of the decimal rule for slope of drains. The scale sketch below shows what is needed for a good job. The doors must be double to each opening, or else have a well-fitting plate inside to prevent leaks of air from stopping the draught. The down-cast pipe and its bend from the boiler will be of cast-iron, and be swept from the boiler through the fuel door; while the pipe in the floor may be of cast-iron, or plain fireclay if this be strong enough to bear the traffic or load over it. The floor on both sides of the flue will get hot, and an intercepting trench had better be made along each side and covered by a brick. An iron pipe laid in and covered with sand between the two trenches, the whole being covered with paving flags, will make a good job. A wood or asphalt covering to the floor will get warped or damaged by the heat. The only damper needed will be the air-slides in the furnace and ashpit doors. This arrangement will also work with a saddle boiler that has no winding flues, but if they wind, the flues must start from the boiler top and rise steadily all the way up to the chimney.

O. WHEELER.

Hot-water Supply to Lavatory Basins.

BRISTOL. — CONSTANT READER writes: "Please explain how to carry hot water to a set of lavatory basins. I have a saddle boiler, circulating cylinder and cold water tank, $1\frac{1}{2}$ in. flow and return, and $\frac{3}{4}$ in. draw-off pipes."

The accompanying sketch will give you some idea of the run and lay of the pipes; the waste pipes and the supports for the basins are not shown, nor are the brickwork and chimney of the boiler. The cleaning holes in the sides of the hot reservoir are only needed for very hard or very muddy water, and if the pipes can be easily disconnected

from the top this latter can be bolted on so as to be removed bodily for cleaning. The pipe for cold water to the boiler can be connected to the side of the hot reservoir, if preferred, below the hot return from the basins. The capacity of the hot-water reservoir depends on the number and size of basins; twice that of the basins is a good rule when the use is regular at all hours, and three or more times when many users come at once at long intervals. The capacity of the boiler may be one-fifth that of the reservoir for regular use and one-third for interval use. The size of pipe marked on the sketch will do for four medium-sized bowls, but for six bowls all in use together the pipes should be $1\frac{1}{2}$ in., 1 in. and $\frac{3}{4}$ in. bore, and larger pipes between boiler and reservoir always help the quicker heating of the cold water. Before ordering the reservoir make a drawing or sketch of it in its place, and mark the pipe branches, &c., in the positions easiest for the man to joint them.

O. WHEELER.

Drying-room for Joinery.

NEWCASTLE - ON - TYNE. — J. H. writes: "Please give me an idea as to constructing a drying-room for joiner-work, either with or without a small fan, or refer me to any books giving such information."

! To properly instruct you as to drying timber would require a small book. You will, however, find some information in Mr. Powis Bale's "Saw Mills, their Arrangement and Management."

10 per cent. Commission on p.c. or Provisional Sums.

MARITZBURG. — CONTRACT writes: "In a recent contract in which the R.I.B.A. conditions were used (where quantities do not form part of a contract) a builder claimed 10 per cent. commission on p.c. and provisional sums, together with all trade discounts. The proprietor had ordered the goods from England, which exceeded the amounts of the p.c. and provisional sums, but the proprietor met the bills for same, the contractor never having to pay out any money to meet the amounts, which were deducted from the contract in final settlement, and the contractor took no objection to the proprietor's action in ordering and paying for the goods. Can you tell me, in any contract where it states that the builder has to provide a certain sum for, say, tiles or any other goods, whether the builder has to expend the full amount or whether any allowance should be made to him? A recent case has been taken to arbitration in which the conditions of contract state 'the contractors are not to vary or deviate from the drawings or specifications, nor execute any extra work whatever, unless upon the authority of the architects,' and in which the contractor agreed to complete the work for a lump sum, in which provisional sums were included: having expended the provisional amounts to the full and made payments on same, for goods which were ordered by the client, he claimed 10 per cent. commission as his profit over and above the provisional amounts included in the contract. Now, as the contract does not provide for any such commission (which is an extra), and clearly states that no extras will be allowed unless upon the authority of the architects, I fail to see how the arbitrator, in any lump sum contract, could award such an extra, and have always understood that the builder included his profit in his tender. This question is of vital importance to the profession, and has caused a considerable stir."

In this case I am of opinion that the arbitrator was clearly wrong in his award, unless it was proved before him that a universal custom existed in the building trade (which was also within the knowledge of the "proprietor") to allow 10 per cent. commission in such a case as the one under notice. There are no recent cases exactly on all-fours with this, for the simple reason that the matter is too obvious to be fought. S. P. J. M.

Acetylene for Country-house Lighting.

BURNLEY. — J. R. L. writes: "(1) I should be glad of any information respecting the use of acetylene gas for country houses. Can it be used for cooking stoves of the usual type, and can you name the publisher and price of any reliable work on the subject? (2) What is the Lusol illuminant recently adopted by some of the Continental cities in preference to either coal-gas in any form, electricity or acetylene? Is there any definite information on the subject?"

In reply to the foregoing, Messrs. Stode & Co., of 48, Osnaburgh Street, Regent's Park, N.W., have been kind enough to supply the following particulars: "Acetylene gas is the best illuminant for country house lighting where one does not wish to entail the expense of putting down an electric-lighting plant. The cost of the light is also much cheaper, and will compare with coal-gas at 3s. 6d.

per 1,000 cub. ft. We are supplying at the present time stoves for cooking and heating by acetylene gas. Up to the present time there has been a little difficulty in getting a good acetylene gas cooking stove, but this difficulty has now been overcome, and our apparatus will give excellent results. Professor Lewis has published the most reliable work on acetylene gas (price 31s. 6d.). He goes into the whole subject very extensively—in fact, rather more deeply than the ordinary man requires. We might mention that to make an acetylene gas installation thoroughly satisfactory the whole of the pipes and fittings have to be specially fitted to stand a high pressure, as acetylene gas is very penetrating, and pipes and fittings that would be sound for coal-gas might not be sound for acetylene gas. It is also essential that a pure gas should be generated, or the gas thoroughly purified, otherwise the impurities in the gas have an action on the pipes and fittings and also cause an unpleasant haze in the room where the gas is burnt. We have no information in regard to the Lusol illuminant."

[Prof. Lewis's standard work on acetylene can be obtained post free from our offices for the price named; also "Acetylene" by Frederick Dye (6s.) and "Acetylene Gas" by W. Doman (3s. 6d.).]

Forming a Bowling Green.

DINGWALL. — X. Y. Z. writes: "I am interested in the formation of a bowling green measuring 42yds. square, with a 6ft. footpath, &c., all round. The site is on made ground averaging 2ft. 6ins. deep, overlying soft swampy ground 15ft. to 16ft. deep. The materials available are stones for bottoming, sand, gaslime, soil (boulder), clayey earth, engine ashes, but no sods. Kindly advise me."

The essential point for consideration is that the bowling green should be always firm and dry enough for use. I therefore suggest that you pay particular attention to the subsoil drainage, putting in, say, four parallel drains either of "level drain" pipes of not less bore than 3ins., or you should make stone drains if pipes are not procurable. In forming the green itself I should prefer to use 10ins. or 12ins. of sand and engine ashes for foundation (with a layer of an inch or two of mould over) rather than the other materials you mention. The whole would in the ordinary way be raked smooth and covered with turf cut 36ins. by 12ins. by 1in. (or 1½ins.) thickness; but if you have no turf a thick seeding—1lb. of seed to every 50 sq. yds. of fine grasses (such as is prepared by the best seedsmen for lawns)—must be sown, slightly raked in and covered with soil. It cannot be used the first year. F. S. I.

Book on Turkish Baths.

LIVERPOOL. — O. E. S. writes: "Please give name and price of a book with plans and particulars of modern Turkish baths."

We only know of R. O. Allsop's "Turkish Baths," price 6s. post free from our offices.

Stone-faced Walls.

MANCHESTER — SUBSCRIBER writes: "Is it advisable to form, say, a 2in. cavity in the external walls of a small house, where the facing is of sandstone and the interior of brick? Would it be satisfactory to make such a wall, on the top floor, 11ins. thick, with a 4½in. stone facing, a 2in. cavity and 4½ins. of brickwork?"

Certainly it is advisable—especially on west and south exposures—to take precautions against driving wet, and a cavity wall, if properly built, is as good as any other method of damp prevention. You will, however, find that it is impossible to build a stone wall of so slight a thickness as you propose, and I should suggest instead of the cavity that you should build a solid wall—sandstone outside

and brick inside, bonded together by "White's Hygeian Rock Composition." The cavity need not be thicker than ½in., and is formed by building in a roin. board of that thickness, removing it at every third course for the insertion of the composition, which is poured into the cavity in a boiling state. The cost of the composition for two labourers' cottages which I have just completed has been £15. F. S. I.

Solution to keep out Damp.

SHREWSBURY. — G. D. L. writes: "Which is the best colourless fluid for applying to a brick wall to keep out damp?"

We do not know of a colourless solution that is efficient for the purpose.

Book on Estimating.

HONG KONG. — RULER writes: "Kindly recommend a good book on estimating, especially for architects, with plenty of prices and costs per ft. cube."

"Estimating" by George Stephenson (6s. 6d.), "How to Estimate" by John T. Rea (10s.). These books can be obtained post free from our offices for the prices stated.

Damp Wall of Bedroom.

LYTHAM. — J. W. T. writes: "The wall of a bedroom always shows damp after rain. The wall faces south-west. The west wall, which is battened, never shows damp. The walls are solid 14ins. The damp does not show in the bedroom above nor in the room below. Do you think if the wall were pointed the damp trouble would be cured? If not, kindly suggest a remedy."

West and south-west walls are always particularly liable to be damp, as they naturally are most exposed to the driving rains. Pointing may very probably be successful in the case you mention, but I have found tile-hanging to be of greater efficacy in such a case; and in recently finished protection works I have successfully carried out the same idea by means of galvanized corrugated iron sheets fixed vertically to the face of the walls by means of wooden battens. Of course this was only done in a case where the property was of little value and very much "out of the way." F. S. I.

Architectural and Technical Publishers.

BARNESLEY. — YOUNG ARCHITECT writes: "Kindly give names of leading technical and architectural publishers in addition to Batsford; also a few names and addresses of reliable second-hand booksellers who make a feature of these classes of works."

Publishers:—Messrs. E. & F. N. Spon, Ltd., 125, Strand, London, W.C.; Crosby Lockwood & Son, 7, Stationers' Hall Court, Ludgate Hill, E.C.; Longmans, Green & Co., 39, Paternoster Row, E.C.; Chapman & Hall, Ltd., 11, Henrietta Street, Covent Garden, W.C.; Charles Griffin & Co., Ltd., 12, Exeter Street, Strand, W.C.; Whittaker & Co., 2, White Hart Street, Paternoster Square, E.C.; Macmillan & Co., Ltd., St. Martin's Street, W.C.; Scott, Greenwood & Co., 19, Ludgate Hill, E.C.; Gresham Publishing Co., 34, Southampton Street, Strand, W.C.; and Cassell & Co., Ltd., La Belle Sauvage Yard, Ludgate Hill, E.C. Most of the second-hand booksellers deal in architectural books to some extent, but Mr. Batsford is the chief source of supply for old works, and indeed for modern books.

Liquid Cements.

NORTHAMPTON. — NEMO writes: "Please give the names of some liquid cements, and the makers of same."

There are many kinds of cements, and what will suit one thing will not suit another. A liquid cement like "Seccotine" may serve your purpose. If not, you will probably find what you want in Spon's "Workshop Recipes."

LOSS OF HEAT FROM BUILDINGS.**How to Calculate for It.**

MR. A. H. Barker read a paper on "Calorimetric Methods of Determining Heat Losses from Buildings and Radiators" at a recent meeting of the Institution of Heating and Ventilating Engineers. The latter part of Mr. Barker's paper related particularly to the title, but the first part of the paper was of general interest, and the following is a summary of this portion:—

The problems presented to the heating engineer are in their very essence dual in character. He has first to determine in the case of each room treated what is the number of British thermal units lost to that room when maintained under the conditions required by the specification, and, secondly, how best to supply that amount of heat to the room.

Engineers are too apt to take what may appropriately be termed too cast-iron a view of the matter and to make the first question, How much heating surface is required in each room? Hence we find formulæ or rules of thumb appropriating so much heating surface to so much glass, and so much to the area of wall surface, and so forth.

It appears to me that in losing sight of the really dual character of the problem in this way engineers lay themselves open to the risk of serious loss, either by providing far more plant than is necessary or by incurring the still more serious expense of rectifying their errors at a later stage.

Both from a scientific and practical standpoint the actual amount of radiating surface is in fact a secondary consideration—secondary in the sense that the required degree of heat can be secured in a room by an amount of surface considerably less than it would be advisable to put in, and that the heat delivered into a room is a quantity far more dependent on the power of the boiler and the arrangement of mains than it is on the heating surface of the radiator in the room.

Conditions Specified.

In nine cases out of ten a specification in this country demands an internal temperature of 60 degs. with an outside temperature of 32 degs. To allow a little margin for safety, it is well to reckon a rise of 30 degs. No mention is made in most cases of the amount of interchange of air required, and even if this were done, who is going to estimate or determine how much air actually passes into or out of a room? Neither is any mention made of the substance or thickness of the walls, nor the character of the roof, nor of many other vital matters, and even if they were given exactly we have not the data for allowing for them.

I am not for the moment speaking of rooms in which there are special means of ventilation provided, but of ordinary rooms provided with the usual doors, windows and fireplaces. But even when special means are present the accurate determination even of the amount of air passing up a flue is by no means as easy as it seems, and a comparatively small error makes a large difference in the calculation for total heat required.

I doubt very much indeed whether any anemometric observations as carried out in practice give anything like a close approximation to the actual quantity of air passing.

Air passing through Walls.

But even assuming that by means of an anemometer it were possible to determine practically and with some approach to accuracy the total quantity of air passing up the flue, there still remains the wholly unknown quantity of air passing in and out through the substances of the walls.

It appears, therefore, obvious that to determine the heat losses with any approach to accuracy by means of calculations and the

ordinary coefficients of heat lost per sq. ft. of glass is of necessity impossible, because factors having a large influence on the result are of necessity impossible of determination.

Position affects Efficiency of Radiators.

It is to be feared that it is a common practice among engineers to determine the amount of heating surface required in a room either from the contents alone or from the glass, roof or wall area without any enquiry either as to what is to be the character of the heating surface, how it is to be fixed, or, more than all, what is to be its temperature. All these matters are of such extreme practical importance that it is by no means an infrequent experience to find in the same installation two radiators of the same surface, whereof one is giving off three times the amount of heat given off by the other. Yet these radiators would be cheerfully put in two equal rooms both requiring the same amount of heat. When a radiator is fixed close to a wall the wall in a few hours becomes heated to a considerable temperature, and this warm wall protects the radiator to a large extent from loss of heat in the back. When a radiator is fixed in a recess the case is still worse. And if the radiator is surrounded by a plinth preventing an access of air to the back the effect is still more marked.

When the radiators are fixed in front of a fresh-air opening the amount of heat lost depends entirely on the amount of air passing over the surface of the radiator.

The question of the temperature at which radiators are maintained is indeed one of the chief factors in the success or failure of a heating apparatus. Personally I have a very great objection to occupying a room heated by radiators at a higher temperature than 140 degs., and I much prefer 120 degs. I believe that a great part of the prejudice against heating apparatus in this country arises from the overheating of radiators, causing the smell with which we are all familiar and giving rise to

The Complaint that radiator-heated Rooms are Stuffy.

Now it is certain that all the heat transmitted by the furnace to the water in the boiler must be dissipated in the building, and that the temperature of the radiator will rise to such a point that all that heat is so dissipated, and the crucial point is so to arrange the mains that it is dissipated at the points where it is required and in such a proportion that no room will be overheated and no room will be too cold.

It is thus clear that the power of our apparatus is represented by

The Power of the Boiler.

provided that the surface of the radiators and the disposition of the mains is such that the radiators are maintained at the temperature at which they will give off in the building all the heat transmitted by the boiler plates to the water. If not, the water in the boiler will boil. If they are so maintained the water cannot boil however hard it is fired.

Now since the heat required to be given off at the radiators is the same as the amount given off by the building when maintained at the required temperature, it is clear that the power of the boiler must be the same as the heat lost from the building. So that the power of the boiler should be calculated quite irrespective of the amount of radiating surface, which is, as I have shown, only a secondary matter.

Also the mains should be calculated irrespective of the surface of the radiators they are to supply.

The amount of radiator surface is only a secondary matter, and determines the degree of comfort and not the temperature in the rooms.

I consider that our chief need at the present time is a more accurate knowledge of heat lost from a room, and I have myself formed the opinion from considerable experience that it can only be roughly calculated from existing data, and that the chief element of uncertainty is the amount of heat passing away by irregular ventilation. It is to this point that attention is required.

CONCILIATION IN THE BUILDING TRADE.

SPEAKING at the annual dinner of the Yorkshire Federation of Building Trade Employers, held at Leeds last week, Mr. S. Smethurst (Oldham) in proposing success to the National Federation said the organization was growing in importance every year, and there could be no doubt that very shortly it would include the cream of the trade. Defensive in its aims, it was founded on a broad basis of representation, and was financially sound. Great hopes were entertained that the result of the new conciliation scheme about to be inaugurated would be the impossibility of further strikes or lock-outs. The scheme had been favourably received in Lancashire, and there was reason for believing that it would be received with equal favour in other parts of the country. If a subject of dispute arose it went first to the local conciliation courts, consisting of local masters and local trade unionists. If these could not agree, it went to the district committee, similarly composed though representing a larger area; while if still no settlement could be arrived at, the matter went to the nearest "centre," the Northern Centre, including the seven northern counties; and if still the negotiations failed, the matter went to the National Conciliation Committee, including employers and trade unionists from the whole country. During the whole of these negotiations there was to be no cessation of work.

Mr. W. Shepherd (London), president of the National Federation, responded. It was true, he said, that the masters' federation was mainly meant for defensive purposes. If it had not been for the strength of that organization such a scheme of conciliation as had been indicated would not have been possible. It was only when two parties became organized and strong that they began to respect one another—that conciliation became possible. They stood for freedom of contract and for equitable and just treatment. When it was realized that, taking the country as a whole, building was the largest industry in England after agriculture, one felt that there was very little litigation and very little friction amongst builders. With regard to the progress of labour, it behoved that Federation to watch what was going on around them. He was ready to acknowledge that the labour representatives who had come to the front had a high conception of their duties and a keen sense of their responsibilities, and it was for employers to watch the trend of events.

Obituary.

Mr. F. Wentworth-Sheilds, M.I.C.E. of Sholing, sewerage engineer to the Itchen Urban District Council, died recently, aged 85.

Mr. W. J. Muckley, for many years headmaster of the schools of art at Manchester and Wolverhampton, died worth £10,876.

The late Mr. H. H. Collins, F.R.I.B.A., of London, left estate which has been proved at £35,460. He bequeathed to the Architects' Benevolent Society two shares in the Architectural Union Co.

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics* :—

Five shops on the south-east side of Staplehurst Road, two houses on the south-west side of Leahurst Road, and one house on the north-east side of Fernbrook Road, Lewisham, on the application of P. Roche. (*Consent.*)

One-storey shops and a one-storey addition at the rear of No. 379, Bethnal Green Road, Bethnal Green, to abut upon Teesdale Street, on the further application of C. M. Shiner, on behalf of W. A. Balls. (*Consent.*)

Extension of the periods within which to erect buildings with bay windows and one-storey shops on a site abutting upon the west side of Peckham Rye and south side of East Dulwich Road, Camberwell, on the application of A. Keen, on behalf of Miss Chamberlain. (*Consent.*)

Retention of a showcase on the forecourt of No. 451, Holloway Road, Holloway, on the application of the International Tract Society, Ltd. (*Consent.*)

Retention of two two-storey shops in front of Nos. 2 and 2A, The Grove, Hammersmith, on the application of L. V. Hunt, on behalf of J. Bedford. (*Refusal.*)

Iron and glass shelter in front of No. 20, Upper Hamilton Terrace, Marylebone, on the application of G. A. Sexton, on behalf of J. Peters. (*Consent.*)

Retention of a projecting sign in front of No. 392, Oxford Street, Marylebone, on the application of W. Castle, Ltd. (*Consent.*)

Retention of a conservatory at the flank and a summer house at the rear of No. 20, Wyndham Road, Camberwell, abutting upon Elmwood Road, on the application of A. E. Percy. (*Consent.*)

Alterations to the iron and glass shelter at the entrance to the Empire Theatre, Leicester Square, on the application of F. T. Verity. (*Consent.*)

Erection of bay windows to Nos. 34 and 40, Glenhouse Road, Eltham, on the application of J. J. Bassett, on behalf of A. Cameron-Corbett. (*Consent.*)

Projecting one-storey shop in front of No. 131, Victoria Street, Westminster, and a projecting one-storey shop at the rear to abut upon Ashley Place on the application of W. Woodward. (*Consent.*)

Addition and a urinal at the "Hanover Arms" public-house, No. 32, Wells Road, Sydenham, with external walls at less than the prescribed distance from the centre of the roadway of such street, on the application of A. J. Style, on behalf of the Dartford Brewery Co., Ltd. (*Consent.*)

An addition to No. 90, St. Ann's Hill, Wandsworth, abutting upon the western side of Allfarthing Lane, on the application of W. West, on behalf of F. R. Turtle. (*Refusal.*)

Projecting one-storey shop in front of Nos. 151 and 153, Upper Kennington Lane, Kennington, on the application of J. A. J. Woodward & Sons, on behalf of the executors of the late George Broom. (*Refusal.*)

Bay windows and porches to twenty-six houses on the south side of Oxford Gardens, Kennington, on the application of Trant, Brown & Humphreys, on behalf of Daley & Franklin. (*Refusal.*)

Retention of a signboard in front of No. 11, Walworth Road, Newington, on the application of F. F. Harris, on behalf of H. Samuel. (*Refusal.*)

Projecting piers and oriel windows in front of Nos. 59 and 60, Pall Mall, Strand, on the application of E. Guy Dawber, on behalf of the London and Lancashire Fire Insurance Co. (*Refusal.*)

One-storey shops in front of Nos. 170 to 182 (even numbers only) inclusive, Putney Bridge Road, Wandsworth, to abut also upon Merivale Road, on the application of W. Bartholomew, on behalf of Mrs. Bell and J. A. Graham. (*Refusal.*)

Projecting one-storey shops in front of Nos. 338 and 340, King Street, Hammersmith, on the application of J. F. Ward, on behalf of Mrs. Masterson. (*Refusal.*)

Retention of an iron and glass covered way to the entrance of No. 3, Douro Place, Victoria Road, Kensington, on the application of Miss F. A. Lee. (*Refusal.*)

Two buildings on the east side of Georgette Place, King George Street, Greenwich, with external walls at less than the prescribed distance from the centre of the roadway of Georgette Place, and with an irregular space at the rear of the northernmost of the two buildings, on the application of H. Adams. (*Consent.*)

Retention of a building at the rear of a stable on the west side of No. 35, Goldhawk Road, Hammersmith, abutting upon the east side of The Grove, on the application of W. B. Eyre. (*Consent.*)

Deviation from the plans approved on December 22nd, 1903, under sections 41 and 207 of the London Building Act, 1894, for the erection of an addition at the rear of a building on the north side of Farm Street, St. George, Hanover Square, so far as relates to the substitution of a men's mess-room on the first floor for the dwelling rooms shown on the approved plans and the construction of the flat roof of such mess-room of wood, covered externally with lead, in lieu of iron and concrete, on the application of J. W. Bradley, on behalf of the Council or the City of Westminster. (*Consent.*)

Deviation from the plans approved on November 7th, 1905, under section 203 of the London Building Act, 1894, for the construction and erection of iron, brick and concrete additions to the generating station, Townmead Road, Fulham, so far as relates to the formation of an opening in the wall of the store building, the removal of the brick partition in the basement between the store building and the boiler-house (the ground floor over the opening formed being supported by steel beams) and an alteration in the steel construction of the roof of the store building, on the application of A. J. Fuller, on behalf of the Council of the Metropolitan Borough of Fulham. (*Consent.*)

Additional rooms over the stables at the rear of No. 81, Eaton Square, St. George, Hanover Square, on the application of G. Trollop & Sons, on behalf of H. D. Brocklehurst. (*Refusal.*)

Iron and glass shelter in front of the hotel, "Maison Jules," Jermyn Street, Strand, on the application of G. D. Martin. (*Refusal.*)

Extension of the period within which the widening and adaptation of a street for carriage traffic of the northern portion of Romford Street, Mile End Old Town, was required to be clearly defined throughout by posts and rails or so otherwise as the Council might permit, and thrown open to the public as a highway, on the application of Rowland Plumbe. (*Consent.*)

Permission to define the roadways of the proposed streets, on the Highview Park Estate, Canterbury Grove, West Norwood (where not already defined by the erection of buildings or by a cutting 4ft. in depth) by posts 10ft. apart and a trench 1ft. in depth between and in line with such posts, in lieu of posts and rails as specified in condition (1) of the Council's resolution of December 21st, 1903, on the application of J. Wilson. (*Consent.*)

Modification of the provisions of that section with regard to open spaces about buildings, so far as relates to No. 2, Charles Street, Kensington, with an irregular space at the rear, and with a portion of such building extending above the diagonal line, on the application of A. B. Rumball. (*Consent.*)

Building on the northern side of Elmer Road, Catford, on the application of E. Wright, on behalf of H. Amey. (*Consent.*)

Retention of two showcases in front of No. 233, Southwark Park Road, Rotherhithe, on the application of E. Hoad. (*Consent.*)

Retention of an iron and glass shelter at the entrance to Nos. 37 and 38, Savile Row, St. James', on the application of H. Poole & Co. (*Consent.*)

Building at the rear of No. 431, North End Road, Fulham, to abut upon Eustace Road, on the application of T. J. Evans, on behalf of A. Dell. (*Refusal.*)

Buildings on the west side of Burgess Hill (late Belle Vue Crescent), Finchley Road, Hampstead, on the further application of Brown & Barrow, on behalf of the trustees of the Burgess Estate. (*Refusal.*)

Enclosing of the portico in front of No. 21, Hill Street, Berkeley Square, on the application of Keeble, Ltd., on behalf of Captain H. S. Clay. (*Refusal.*)

Buildings abutting upon Red Lion Court, Fleet Street, City, with external walls at less than the prescribed distance from the centre of Red Lion Court, on the application of Griffin & Wollard, on behalf of A. Rust. (*Consent.*)

Building on the south-eastern side of Barron's Place, Southwark, on the application of A. E. Chasemora, on behalf of W. Sumpton. (*Refusal.*)

One-storey shop on the south-west side of Cross Street, Woolwich, on the application of W. C. Poole, on behalf of J. T. Smith. (*Refusal.*)

Coal store on the western side of Ifley Road, Hammersmith, on the application of J. Dorey & Co., Ltd., on behalf of the trustees of the Godolphin and Lutyens Girls' school. (*Consent.*)

The Theatre and Music Halls Committee also reported the following :—

Plan submitted by Mr. R. H. Cox showing a proposal to remove the kitchen from the basement beneath the Strand entrance at the Café Vaucluse, Strand, and to use the space formerly occupied by the kitchen for the purposes of a new restaurant with separate means of exit to the Strand. (*Consent.*)

Drawing submitted by Messrs. F. Matcham & Co. showing the proposed spacing of the pit seating at the Holborn Empire (late Royal Music Hall), Holborn. (*Consent.*)

Plan submitted by the Town Clerk of the Metropolitan Borough of Lambeth showing the structural alteration recently made in the yard of the Lambeth Public Baths, Kennington Road, in connection with the installation of "Nuconomie s." (*Consent.*)

Plans submitted by A. O. Collard showing the proposed arrangements in connection with the Furniture Exhibition to be held at the London Exhibitions, Earl's

Court, from 14th to 24th February, 1906, and with the "Tyrolean Village" and the Teplitz Water Exhibit, which are to form part of the forthcoming Imperial Royal Austrian Exhibition. (*Consent.*)

Plans submitted by A. O. Collard showing the proposed arrangements in connection with the Engineering and Machinery Exhibition to be held at Olympia from 15th September to 17th October, 1905. (*Consent.*)

Plans submitted by Runtz & Ford showing a proposal to place four gas radiators in the stalls and balcony at the Pavilion Theatre, Mile End. (*Consent.*)

Plans with regard to the under mentioned premises were submitted to the Committee during the recess, and the arrangements shown therein appeared satisfactory :—

Eolian Hall, New Bond Street.—Plan showing extension to the platform.

Carlton Theatre, Greenwich.—New urinal accommodation for artistes.

Finsbury Town Hall, Rosebery Avenue.—New teak doors in corridor.

London Pavilion Music Hall, Piccadilly.—Plan showing a proposal to add to the attendants' room in the basement, the space formerly occupied by the attendants' lavatory, &c.

Woolwich Town Hall, Upper Market Street, Woolwich.—Arrangement of the seating in the galleries.

Plans submitted by W. Hunt showing how it is proposed to give effect to the suggestions made by the Council for the structural improvement of the Princess's Theatre, Oxford Street. (*Consent.*)

Plan submitted by E. J. Stubbs showing the proposed construction of screens and doors at the sides of the main entrance porch at the Royal Horticultural Hall, Vincent Square, Westminster. (*Consent.*)

Plan submitted by Smee & Cobay showing the proposed conversion into dressing-rooms of certain store-rooms in the basement of the Royal Theatre, Dean Street, Soho. (*Consent.*)

Trade and Craft.

New Designs for Mantels.

The illustration of the "Westbourne" suite on this page is one of several new patterns being introduced by Messrs. Young & Marten, Ltd., the well-known building supply merchants, of Stratford, E. The design shown is very effective in execution, comprising a fine cast-iron mantel, primed white, with an opening of 40ins. by 38ins., jambs 10ins., shelf 5ft. 9ins. by 11ins., and height 52½ins. The interior has an adjustable canopy, barless fire, with a full-brick back in sections, while the hob surround is made up of 3in. by ½in. tiles, and the hearth to match. The total cost of this set is £15 18s. 6d., being £4 7s. 6d. for the mantel, £2 11s. for the interior, £8 for the surround, and £1 for the hearth. The curb shown is supplied for £2 in iron finished with Berlin black. This set will be found very suitable for good-class houses, and the design is one which will stand any amount of wear and tear. It will at once be seen what a very great advance this type of mantel and grate is upon the old relics of the mid-Victorian era, a few of which still survive. Messrs. Young & Marten make a speciality of wood suites, which are very much in vogue just now, and for smaller class property they find a very large demand for the "Ilford"

suite. The mantel of this suite can be supplied in fumed oak or polished mahogany; the interior has an adjustable canopy with bronzed-copper inlaid panel; the fire-box is fitted with a solid brick back in four sections; the bottom grate has a barless fire; and on either side are tileslab panels. At Messrs. Young & Marten's showrooms at Stratford are displayed many other suites embodying every grade of quality and design. Their No. 28 illustrated trade catalogue also affords a further large range of patterns, with prices attached to each part of all the suites shown, so that it should be of particular service to builders.

THE "WESTBOURNE" SUITE, BY YOUNG AND MARTEN, LTD.

CARRON COMPANY'S

INCORPORATED BY
ROYAL CHARTER 1773

“ESTO” FIRE GRATES.

THE “Esto” Fire is acknowledged to be the most perfect type for effecting complete combustion and saving fuel. The bottom grate forms a “well”-shaped cavity, which by practical experience is found to be the best contrivance for combustion.

THE illustration shows Carron Company's latest pattern “Esto” Fire, which is now made with a guard bar above fret. This bar obviates any danger caused by falling fuel, and makes the Grate more efficient without detracting from its fuel-saving properties and appearance.

The new design “Esto” Grate is supplied with open (as illustrated) or semi-low combustion fire. The bottom grating of the latter type is fitted with a sloping fire brick on front side to retard combustion and retain heat. Unless specially ordered the open fire is furnished.

The “Esto” Fire can be fitted to a large selection of Interiors, Registers, and Mantel Registers.

Write for No. 11 Radiant Fire List.

Works—CARRON, Stirlingshire.

Electrical Notes.

Battery Rooms.

Architects are often called upon nowadays to include in their schemes a room for the accommodation of storage batteries, either for lighting or power purposes. It is relevant therefore to refer to the paper on the subject which Mr. F. W. Crawter read before the Electrical Contractors' Association recently. The floor of the room, he said, should be of concrete, either rendered on the surface, or, better, finished with a 2in. layer of asphalt; with regard to this latter, however, some objection had been raised on account of the bearers sinking into it with very heavy cells, and as an alternative brick might be used. Tiles were not to be favoured unless laid in pitch, because when cement was used the acid got underneath the tiles and caused the floor to bulge and loosen. Very warm situations were unsuitable for battery rooms. Sometimes the room had a plaster ceiling, in which case care should be taken to see that this was in good condition and not likely to flake off and fall into the cells, as the addition of matter containing lime was most undesirable. In the discussion following the reading of the paper one speaker, referring to the need for proper drainage provision, instanced a case where an architect had emptied the drainage into a lake, with the result that all the fish therein were poisoned.

Electricity in Cement Works.

It is not so very long ago that electricity was regarded by works managers as an interesting form of power, very admirable for small purposes, but hardly likely to be adaptable for heavy work for a considerable time to come. Now, however, a great change has taken place, and electricity is being in-

creasingly employed for driving machinery of all kinds. It has invaded the building industry—conservative enough in all conscience—and the electric crane hoisting girders into position is becoming a familiar sight, whilst soon we may hope to see mortar mills and mixers all driven by this eminently convenient power. As another instance of its application to heavy machinery we may instance the new cement works of Messrs. Hall & Co. (Croydon), Ltd., at Beddington, near Mitcham, Surrey. Here the machinery in the mixing and kiln houses and the coal and cement mills are driven off a main shafting connected by ropes to a 700-i.h.p. Musgrave engine, but as an alternative, and in order to avoid stoppages when the large engine is shut down, the kilns and coal mills can also be driven by two Westinghouse motors of 100-h.p. each, while a 15-h.p. motor operates one of the slurry mixers. It is an essential that the plant shall operate continuously, night and day, not even being shut down at week-ends: and for this reason the main shafting is capable of being driven both by the engine and the motors, a friction clutch being arranged to enable either to be thrown out when desired.

Electrical Lighting of Workshops.

The electrical lighting of workshops is a matter requiring very careful consideration on the part of the architect and the electrical engineer. Mr. A. E. Edwards, M.I.M.E., dealt with it in a paper which he read recently before the Coventry Engineering Society. The best treatment for the walls, he said, was to whitewash them, so as to gain as much reflecting service as possible, while all machinery should be painted a grey colour. Sharp shadows should be avoided by using suitable globes for the lamps. It was important to use a good dynamo and to secure a regular output. If a gas-engine were

employed to drive the dynamo it should have a heavy flywheel and should run at a high speed. A flywheel on the dynamo was absolutely unnecessary. Mr. Edwards strongly condemned the practice of putting two flywheels on different shafts and trying to get a belt to take the inevitable back-lash. As to whether it would pay to erect a private installation compared with supply from an outside source, that would depend very much on the length of time for which the lights were required. It certainly would not pay on an installation of fewer than 300 lights, unless the lighting hours were more than ordinary.

Tantalum Lamps.

In the "Electrical Review" we notice an interesting letter in regard to the life of these lamps when running in series, written by Mr. W. Fennell, of the electricity department at Wednesbury. Mr. Fennell says: "The cause of premature failures is the uneven current consumption, even when the lamps are ordered specially for running in series. By adopting the following course I have obtained good results:—Wire two lamp-holders in series, and put a voltmeter across one. On receipt of a batch of lamps, sort them out so that with each pair the same reading on the voltmeter is obtained when the lamps are crossed over. Then tie the two wrappers together, and see that the lamps are used together. When one lamp of a pair fails, take both out and put the partly-used one into stock until several are said by; then sort out the old ones as before, and use them in pairs for renewals. The same, of course, applies to all lamps run in series. . . . If the makers would send out the lamps properly paired for series running, it would help the ordinary consumer to appreciate the lamps at their proper value on high-voltage circuits. . . ."

A NEW LEEDS BUILDING.

THE new block of offices which has been built at a cost of £11,000 from designs by Mr. William H. Thorp, F.R.I.B.A., for the Phoenix Fire Insurance Co. in South Parade, Leeds, comprises on the ground floor a large general office 28ft. 6ins. by 23ft. 6ins., secretary's private office 14ft. by 12ft., and typists' office 15ft. 6ins. by 12ft., the remainder of the building being planned to accommodate ten suites of offices with requisite lavatory accommodation. Glazed brickwork and tiles have been used largely on the interior, the former supplied by the Leeds Fireclay Co. and the latter by Mr. Alfred Whitehead, of Prudential Buildings, Leeds. The whole of the walls of the Phoenix suite of offices are lined with a deep tone of ivory-white tiles, and all corridors and staircases are provided with celadon green glazed tile dados 5ft. high. In addition to a wide staircase of concrete steps by Stuart's Granolithic Stone Co., Ltd., a passenger lift by Messrs. Waygood & Co. gives access to the various floors of the building. The building work was carried out by Leeds contractors; the iron palisading and grille over the entrance by Mr. Nelson Dawson, of Chiswick Mall; bronze cartouches, electric light fittings, &c., by the Bromsgrove Guild of Handicraft; stained and leaded glass by Messrs. Pape & Co., of Leeds; and plaster enrichments of ceilings by Mr. G. P. Bankart. The heating system is by Messrs. W. Richardson & Co., of Darlington. The fittings and furniture in the Phoenix suite were specially designed by the architect. They are carried out in polished teak and stained and polished kauripine. Messrs. Elgood & Co., of Leicester, supplied locks and ironmongery.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending January 26th thirty failures in the building and timber trades in England and Wales were gazetted.

J. W. HILL, architect, Bridgwater. Liabilities £277; deficiency £137.

J. W. LUCAS, builder and contractor, Bournemouth. Adj. Jan. 10th.

J. SUGDEN, builder, Liverpool. P.E., Liverpool C.C., Jan. 29th, at 11.

A. J. GARDNER, builder, Teddington (late Twickenham). Adj. Jan. 12th.

W. J. WATTS, builder and contractor, Worthing and Grays (late Southend-on-Sea). Adj. Jan. 8th.

C. SEWELL, plumber, Abertillery. P.E., Newport Town Hall, Feb. 8th, at 11.

A. H. GOODALL, architect and surveyor, Nottingham. Gross liabilities £8,950; assets £89.

W. H. LISTER, builder's manager (late builder), Leeds. P.E. Leeds C.C., Feb. 5th, at 11.

T. B. LAMB, builder, &c., Fulwood. Gross liabilities £11,671; expected to rank £1,735; assets £1,242.

H. W. RAMSDEN & Co., decorators, Hulme. P.E., Manchester C.C., Feb. 5th, at 10.

WHITMORE & GAUNTLETT, builders, Liphook. P.E., Portsmouth C.C., Feb. 12th, at 11.

J. FLETCHER, builder, Horwich. P.E., Bolton C.C., Feb. 14th, at 3.

H. B. SOUTHERN, builder, Bolton. P.E., Bolton C.C., Feb. 14th, at 3.

H. MURCH, builder, Notting Hill. P.E., London Bankruptcy Court, Feb. 23rd, at 11.30. Adj. Jan. 18th.

J. D. WILKINS, builder and contractor, Aberdare. P.E., Aberdare Temperance Hall, March 12th, at 10.30.

W. COOZE, painter and decorator, Newmarket. P.E., Cambridge Guildhall, Feb. 14th, at 11.

H. DODD, builder and contractor, Liverpool. Adj. Jan. 20th.

HARDMAN & Co., decorators' merchants, Blackburn. P.E., Blackburn C.C., Feb. 7th, at 10.30.

W. EATON, builder and contractor, Liverpool. Liabilities £1,106; assets £557.

J. C. COOKE & Son, painters and decorators, West Bromwich. R.O. Jan. 18th.

H. GALLETT, builder and contractor, Sutton Coldfield. R.O. Jan. 19th.

H. H. BULLOCK, plumber, Colchester. First meeting, 36, Princes Street, Ipswich, Jan. 31st, at 2.30. P.E., Colchester Law Courts, Feb. 23rd, at 11.30.

E. A. CHASE, builder, Bristol. First meeting, O.R.'s, Bristol, Jan. 31st, at 11.45. P.E., Guildhall, Bristol, March 2nd, at 12.

J. R. SHORLAND, builder, Margotfield. First meeting, O.R.'s, Bristol, Jan. 31st, at 11.30. P.E., Bristol Guildhall, March 2nd, at 12.

P. A. MILES, builder, Westgate-on-Sea. First meeting, O.R.'s, Canterbury, Feb. 1st, at 12.30. P.E., Canterbury Guildhall, Feb. 15th, at 10.

A. B. H. FUTTER, contractor, Great Yarmouth. First meeting, O.R.'s, Norwich, Feb. 1st, at 12. P.E., Yarmouth Town Hall, Feb. 6th, at 11.

A. ASHFORD, builder, London. Liabilities £305; estimated assets £137. P.E., London Bankruptcy Court, Feb. 21st.

W. BELCHER, brick merchant, London. Liabilities £18,000. The assets, estimated to produce £8,289, only realized £35, though a further £200 may be received.

R. BALDWIN, builder, Small Heath. First meeting, 191, Corporation Street, Birmingham, Feb. 2nd, at 12. P.E., Birmingham C.C., Feb. 21st, at 2.

W. KIRKPATRICK, granite and stone mason, Manchester. First meeting, O.R.'s, Manchester, Jan. 31st, at 2.30. P.E., Salford C.C., Feb. 12th, at 11.

New Companies.

EBBW VALLEY BUILDING CO., LTD. Capital: £15,000.

LARGER LONDON LAND CO., LTD. Capital: £10,000.

FREDERICK MILLER & Co., LTD., builders' merchants, &c., Shepherd's Bush, W. Capital: £2,000.

COUNCIL.**
GARDEN FIELDS COUNTY COUNCIL SCHOOL,
ST. ALBANS.The Education Committee are prepared to receive
TENDERS for the carrying out of ADDITIONS and
ALTERATIONS to the Garden Fields County Council
School, St. Albans.Persons desirous of tendering for the work may see
the Drawings, Specification, Agreement, &c., at the
County Surveyor's Office, Hatfield, on and after Monday,
February 5th, 1906, between the hours of 10 a.m. and
4 p.m., except on Saturday, when they will be on view
from 10 a.m. to 12 noon.A copy of the Schedule of Works and Prices (Quan-
tities), and a Form of Tender, can be obtained at the
County Surveyor's Office upon payment of Two Guineas,
which sum will be returned to the tenderer upon receipt
of a bona fide tender and the documents which have
been supplied to him.Sealed tenders, endorsed "Tender for alterations and
additions to Garden Fields C.C. School, St. Albans,"
must be delivered to the undersigned at his Offices not
later than 5 p.m. on MONDAY, February 19th, 1906.Such security for the due execution of the works as
the Council may require must be given by the Contractor.
The lowest or any tender will not necessarily be
accepted.

URBAN A. SMITH,

County Surveyor.

County Surveyor's Office, Hatfield,
26th January, 1906.**CHEL TENHAM EDUCATION
COMMITTEE.**
TO BUILDERS.Tenders are invited for the ERECTION of new
SCHOOL BUILDINGS, to accommodate 1,100 children,
for the Naunton Park District of Cheltenham, in accordance
with Plans, Specifications, and Conditions of Contract,
to be seen at the Offices of Messrs. CHATTERS
and SMITHSON, Architects, 17, Regent St., Cheltenham.Early application is requested for bills of quantities,
which will be supplied by the Architects upon receipt of
a deposit of £2 2s., to be returned upon receiving a
bona fide Tender.Tenders, sealed and endorsed, must be delivered to
the undersigned by TWELVE o'clock, on THURSDAY,
the 22nd FEBRUARY next.No pledge is given by the Committee to accept the
lowest or any tender.

WILLIAM PRESTON,

Education Offices,

veying, and levelling.1617.—GENERAL FOREMAN (45); capable, good man-
ager; exp. in all branches; carpenter and
joiner by trade; good refs.

See p. xx for the Employment Register.

**THE VALUE OF
OUR EMPLOYMENT
REGISTER.**THIS REGISTER was commenced as a serious
endeavour on our part to meet a need that is
continually felt both by EMPLOYERS and EM-
PLOYED, and we are pleased at the practical
appreciation that has been shown by our readers
since THE REGISTER was first started.Nothing is more trying than to be out of
employment, but the difficulty of the position is
terribly augmented when money has constantly
to be paid for advertisements in order to find
other occupation.On the other hand an Employer who has just
obtained an important contract most likely needs
you; and has a post to fill that you are wanting,
but neither of you can find each other.THE REGISTER serves this purpose and so
meets both cases. For those wanting employ-
ment it is an inexpensive means of keeping their
names and qualifications before the right people,
and for the Employer it is a ready means of
finding just the man he wants, without delay.We are encouraged to find how
largely our columns have been instru-
mental in meeting the requirements of
both parties in the manner indicated
above, and we thank those advertisers
who have written expressing their
pleasure and indebtedness to THE
REGISTER.Many have found it an invaluable
aid in getting appointments, and we
would urge all those who are out of
work, or want to change their situa-
tions, in fact, all who have a "want,"
to make use of these columns and
thus make THE REGISTER a record
of still more value to Employers and
Employed.For 3s. we give 3 insertion
(four lines), in our "Appts.
Wanted" Columns, and also 6
insertions in the "EMPLOYMENT
REGISTER" (see page xx).**THE TITLE PAGE

Curly Gables. To the list of stock features in modern architectural practice which have been pilloried in these columns at one time and another we think the overuse of the curly gable should be added. The fronts of buildings are disturbed quite enough as a rule without any playful fancy in gables. The curly form has the distinction of antiquity, but we are inclined to regard it more or less with suspicion. It never was a particularly logical use of material. A gable coping requires to be protected against the penetration of water and the consequent disintegration by frost, but the curved and twisting outline of the Dutch gable does not carry off the water quickly enough. These Dutch gables, however, were built of bricks, and the same necessity for care in this respect did not arise as with stone copings. If the mortar which kept the bricks in place was disintegrated it could easily be re-pointed, or the brickwork reset. But with stone the material, once loosened, is irretrievably damaged, and the forms copied to-day from the brick gables of the past are unsuitable with stone coping. Apart from this, moreover, the effect of the gable upon the general design of a modern building is more often than not distressing. Whereas the gable end of the Netherlands usually gave relief to a somewhat plain street front of a house of narrow width, modern frontages are wider and generally embrace many more decorative features, containing two or three gables. The curly

gable thus creates an unhappy effect. It quarrels with the rest of the front and destroys all restfulness or austerity; the building becoming overloaded. There is a further development in the use of segmental gables. From a practical point of view this form may rank next in efficiency to the straight pointed gable, but we feel that it was more appropriate in its original position—namely, at the end of a barrel roof—than as now commonly employed. The outlines produced by pitched roofs of many little gables and gablets running against segmental gables are not particularly pleasing, and the gables of flattened curve or hog-backed gables are the ugliest and most ludicrous of recent architectural inventions.

Transport and Local Materials. The complexity of modern building would startle any architect or builder born 100 years ago if he could return to-day. The immense development which has taken place is almost directly due to the improvements in our means of transport. These means have been still further improved within the last two or three years. Possibilities are opened out which will no doubt result in much greater facilities for building, and it is to be hoped they will result in the use of local materials once again. Formerly almost the only building material which was imported was Caen stone, used in Westminster Abbey and other notable Gothic buildings. The reason why this stone was used in preference to local materials was the same as that which leads to the use of foreign materials to-day in preference to native—namely, the cost of bringing materials from the local source of supply to the large commercial towns which had arisen at the mouths of rivers or on rich plain lands. Other countries early used brick, but England for her important buildings seems to have preferred stone. As these buildings were chiefly erected close to the rivers or seashore, it was easy and convenient to bring a soft easily-worked stone such as Caen instead of resorting to local stone, which it would have been difficult to transport many miles over the ill-made roads or across open lands by horse labour. Trade was then restricted. First of all canals; and then railways, opened up further fields of supply of building materials and enabled a much greater variety to be used in obedience to increased demand. The cheapness of water carriage still enables materials far removed in origin to compete with local ones. This is regrettable not only because it leads to loss of employment among workmen in England, but because it is destructive of that local character which is so charming in the buildings of the past. Architects often endeavour to put their faces against the use of materials from many different districts far removed from the district in which a building is to be erected, but in this commercial age their clients generally require to buy their materials in the cheapest

market. We have two typical instances to-day—namely, the granite and marble industries. We bring marbles from Norway, Belgium, France, Italy, Portugal, Algeria and America, while granite comes to us from Norway and Sweden; yet we have in Devonshire, Cornwall and Ireland many marbles as fine, if not finer, than those abroad, while the Irish and Cornish granites and the granites of Scotland are all that we could desire if obtainable. The foreign marble and granites have been developed by their easy water carriage and the cheapness of the labour until now they have built up a connection, and established machinery, which enables them to prevent our local material being profitably worked in competition, but there is no doubt that the time is soon coming when the shorter distances of supply will render them economical. This will be effected by motor traction and improved roads. We have a good deal of timber, more particularly oak, which could be used if it could be easily brought to the towns, and motor traction has already been advocated for rendering afforestation a profitable industry in Great Britain. Still more so does this apply to stone, granite and marble. The competition of motor traction will it is to be hoped remove the anomalies in railway rates which at present partially cripple many British industries. Machinery and power are becoming cheaper and more used by the smaller consumer, and we look forward to the time when materials will be obtainable best and cheapest from quarries and saw-mills and stone and woodworking shops in the immediate locality, so that our buildings may once more become more typical of the soil, more local in character and truly evolutionary. The question of using local materials not only affects us, but the world over; every nation now strives to be self-centred and every town takes pride in its industries, history and associations. Architects must sympathize with these endeavours, and will look sympathetically upon the recent departure of the Bombay Port Trust, who have decided to use Indian granite for the new docks now under construction. Formerly Aberdeen and other granites were imported for such works, but the 60,000 cub. ft. now required will be drawn from Indian quarries, thus effecting a saving of £13,000. Samples of granite from Raichur, Khanapur, Karwar, Mangalore and Goa were sent over to this country to be tested, and proved to be equal to Aberdeen, Cornish and Norwegian (indeed, they are stated to have been better). This example serves to remind us that in the marble industry to which we have above referred we still neglect the famous marbles of India. American marbles we are now beginning to obtain, but the marbles of India with which so many stupendous and magnificent buildings have been constructed still remain beyond our pale.

THE MONUMENT TO VICTOR EMMANUEL II. IN COURSE OF CONSTRUCTION ON THE CAPITOLINE HILL AT ROME. THE LATE GIUSEPPE SACCONI, ARCHITECT.

This huge work has been in progress for twenty years, and is still a long way from completion. The cost down to the end of 1904 was £2,500,000. Count Sacconi, the architect, died last September, and Signori Placentini, Koch and Manfredi, have been appointed to carry on his design to completion. Detailed particulars and illustrations of the whole design will be found in *The Builders' Journal* for October 23rd and December 13th last. The brick core and base seen in the centre of the view above are for the statue and pedestal of Victor Emmanuel.

PRESERVATION OF IRON AND STEEL.

The Action of Cement and Plaster.

THE collapse of Charing Cross Station roof has caused considerable discussion on the preservation of iron and steel in buildings against corrosion, and alarmist statements have been made about the safety of metal structures and the impossibility of insuring efficient protection for a number of years without frequent repainting. We have already shown the illogical position of the architects who would prevent the use of iron and steel for structural purposes. In a few, however, of the great amount of theorizing on little or no evidence, we think it well to publish the following data of American experience which were collected some time ago by Mr. W. W. Kenly, A.M.Soc.C.E., and read at a discussion on the preservation of materials held by the American Society of Civil Engineers.

American Experience.

In 1897, in compliance with a request from former Superintendent of Buildings of New York City, the writer prepared a paper relative to the corrosion of metal in old bridges, and the chemical action which takes place between plastering materials and iron or steel when in contact.

The evidence given in that paper, parts of which are quoted below, was taken from papers and discussions before the American Society of Civil Engineers, and should be satisfactory and conclusive, as it represents the experience of some of the most distinguished members of this Society. In addition, the results of some tests conducted by the writer as to the corrosive effect of certain wall-plastering materials upon enclosed metals are given.

Conclusive Evidence.

The Transactions of the American Society of Civil Engineers have been carefully examined in reference to this subject, and it was found from these Transactions to be positively and absolutely established that iron and steel when embedded in cement-mortar are not corroded if the cement-mortar remains intact—that is, not cracked or broken to such an extent that the fissures become filled with water or subject to the action of the atmosphere.

The evidence is also positive and absolute that iron and steel are not corroded by lime-mortar.

The following is quoted from the Transactions:—

First.—“The caustic alkalis and alkaline earths prevent the oxidation of iron by neutralizing the acids. Iron, therefore, does not corrode in alkaline solutions or when embedded in lime.” *

Under Bilge Water.

Second.—“We have found cement to be a valuable protection for a ship against oxidation from bilge water. I have seen cases where these plates had been four or five years under the bilge water, when they were just as bright under the cement as when the ship was built. This has been the experience in the American and British navies, that cement applied to the surface of the plate in the bilge water under the engine-room and fire-room does protect it against oxidation.” †

Cement Wash an Efficient Protective.

Third.—“We uncovered about four lengths of the anchor chains in the Niagara Bridge, and the pins and bars there were entirely free from rust. In one place the bars and chains had been painted, and in picking off the cement that had covered them quite a chunk would come off, and underneath they

looked as bright as new. The bright end of a pin that had been filed twenty-five years before looked just as if it had been filed that day.”

“The cement that Mr. Roebling used was Thorold cement. On the tops of the towers the saddles and the cables lying in them were covered to a considerable depth with cement mortar, and when it was removed the wires were perfectly clean and bright. They are so still.” *

And from the same paper:—

Fourth.—“In 1876, when the bridge over the Kentucky River was built for the crossing of the Cincinnati Southern Railway several links of the anchorage of the Suspension Bridge, which was partly built by Roebling at the same place in 1855, were dug out and were found in a perfect state of preservation, not a spot of rust being apparent on the bars; but the mortar in which they were embedded was very compact and dry and of excellent quality.” †

Reinforced Concrete.

The following quotation is from the discussions on a recent paper entitled “On Painting the Louisville and Jeffersonville Bridge”:—

Fifth.—“The problem of the covering of iron with concrete or cement has probably been worked out more successfully in France than any other country. About a year ago the speaker made quite a study of concrete construction in buildings under several of the French systems—the Monier, the Melan, and others—and in every case the iron was covered directly with the cement, without paint or varnish or anything intervening.” ‡

From the discussion on a paper entitled “The Protection from Corrosion of Iron-work used as Covering for Railroad Tunnels”:—

Sixth.—“The cement mortar, I suppose, really does preserve the iron from the effects of rusting. Not long ago I heard Mr. Robert Moore describe the method of treating bolts for bridges, by which, instead of using lead and sulphur, Portland cement was used, and it was found that the bolts were much better preserved in every way against rust and against pulling.” §

Iron in Concrete Pipes.

“As to the adhesion of cement to iron, it is well known that iron pipes coated with cement are laid down by the mile. These have been taken up in many places, but not because of lack of adhesion of the cement. I have taken up pipes that had been laid many years, knocked off the cement, and found the iron as bright as new.” ||

The above record establishes the fact that cement mortar will protect iron and steel if the cement mortar is kept intact around the material.

Lime Mortar.

Now, as to the lime mortar. All natural cements are made of limestone. Lime such as used for building purposes contains exactly the same ingredients as cement, the only difference being that both vary in proportions of the ingredients, thus:—The lime used for building purposes, plastering, &c., is composed of 90 per cent. of carbonate of lime and the remaining 10 per cent. of what is called impurities, such as silica (sand), alumina (clay), manganese, &c., and a limestone makes a slightly hydraulic or eminently hydraulic cement according to the variations of the proportions of the impurities, thus: the eminently hydraulic cements contain about 65 per cent. of carbonate of lime and 35 per cent. of the impurities, such as silica, alumina, &c.

By quotations from the above Transactions

it was established that the ingredients in cement mortar do not cause corrosion; therefore, the same ingredients in lime mortar will not cause corrosion, as exactly the same materials are used in cement and lime mortar.

In support of this argument the following practical experience is submitted:—

First.—During the construction of the extension of the Sixth Avenue Elevated Railroad, Phoenix iron columns were used. These are closed columns, and are inaccessible to painting after being erected, and this has always been a serious objection to the use of the Phoenix column. In order to overcome this inability to paint the interior of these columns, and to protect the interior from corrosion, the columns, especially around the “S” curve from One Hundred and Tenth to One Hundred and Fourteenth Streets, were filled with ordinary lime mortar to prevent them from corroding on the interior surfaces. Mr. Edward Wegmann, now Division Engineer of the Croton Aqueduct, with headquarters at Katonah, New York, was the engineer in charge of this work.

After Twenty-five Years.

Second.—Mr. Prince, of the firm of Prince & Kinkel, ironworkers and contractors, of New York, says that he has taken down ironwork which had been erected over twenty-five years and which was covered directly with ordinary lime mortar, and the ironwork was as bright as when first erected, and entirely free from corrosion.

Third.—The statement of Mr. Theodore Cooper quoted before:—

“The caustic alkalis and alkaline earths prevent the oxidation of iron by neutralizing the acids. Iron, therefore, does not corrode in alkaline solutions or when embedded in lime.”

Fourth.—Mr. W. H. Burr, A.M.Soc.C.E., made a report as to the result of competitive tests at the Bowling Green building in August, 1896, on the Roebling wire partition. Lime plastering mortar, gauged with Atlas Portland cement was used. Mr. Burr says in his report: “The network was thoroughly embedded in the scratch coat, and I could discover no sensible corrosion of the wires.”

To quote again from a report made by Mr. A. J. Robinson, of the well-known firm of Robinson & Wallace, builders, of New York, being a report of the above-mentioned competitive test made on the Roebling wire partition: “I found no rust on the wire from lime-gauged machine mortar.”

Mr. Isaac E. Ditmars, architect, in a report on the same competitive test says: “I found the lime plastering mortar gauged with Portland cement did not appear to rust the wire.”

A Bridge Example.

Returning again to the Transactions of the American Society of Civil Engineers, we find in the paper on the “Restoration of the Cable Ends of the Covington and Cincinnati Suspension Bridge,” when the cables were removed, Mr. Bouscaren, engineer-in-charge, reports that the mortar in immediate contact with the wires was impregnated with iron rust, and formed a very hard crust around the strands. “The outside wires of the strands were, as a rule, bonded together in a matrix of rust, giving to the strands the appearance of solid bars, yet in a few spots the wires were bright and well preserved.”

In the discussion of this statement of Mr. Bouscaren, Mr. Theodore Cooper said as follows: “As far as this case goes, the faith of Mr. Roebling and other engineers in the preservative effects of cement mortar need not be shaken, for, from the author's description of the masonry and the wooden blocks and chips embedded therein, the cables were not embedded in cement mortar.” And, also, that “the conditions necessary to preserve

* L. L. Buck, vol. xxviii., p. 367.

† G. Bouscaren, vol. xxviii., p. 370.

‡ R. W. Lesley, vol. xxxix., p. 33.

§ Desmond Fitzgerald, vol. xxvii., p. 330.

|| J. P. Frizell, vol. xxvii., p. 330.

* Theodore Cooper, vol. xi., p. 425.

† H. S. Haines, vol. xxviii., p. 366.

iron from corrosion, as we understand them, are total exclusion of acid substance or any material which may by its own changes produce any acid action. That percolating through cement has any acids contained therein neutralized: this is the natural explanation of the preservative character of cement mortar. If, however, the cement covering be imperfect, so that any water can pass without this neutralizing of the acids, oxidation must be expected."

The Simplest Proof

that lime mortar and lime mortar gauged with cement do not corrode iron or steel is the fact that the operative plasterers leave their steel tools in the mortar overnight and for many consecutive hours, and on taking out the tools find they are not rusted.

Patent Plasters.

Having now discussed the corrosive effects of lime mortar and cement mortar upon iron and steel, we come to the discussion of the patent plasters, or so-called hard plasters. In a circular issued by one of the patent plaster companies, July, 1897, we find the following: "Our method of manufacture renders the patent plaster the only material that does not corrode iron, metal lath or nail heads." We will now see if this statement is correct. In August, 1896, a competitive test was made in the Bowling Green Building, Nos. 5-11, Broadway, between lime mortar gauged with Atlas Portland cement and the patent plaster, rendered on the Roebling wire partition. Mr. William H. Burr in a report on the results said:—

"I found that the patent plaster had induced active and serious corrosion of the wire holding it in all the numerous instances where I had opportunity to observe this effect. In all these examinations I found the patent plaster materially inferior in respect to qualities of hardness and tenacity, and lacking monolithic character, as well as possessing some quality which induces active corrosion of the wire partition. This latter effect might produce a serious result, in some instances at least, in a comparatively short time."

Mr. Burr stated that he could discover no sensible corrosion of the wires from cement-gauged lime mortar. The results of this examination exhibit the superior excellences of

Portland Cement as an Agent for giving Strength and Hardness to Wall Plaster, and it possesses the additional valuable quality of preserving the wire partition against corrosion, whereas some element in the patent plaster actively induces it.

In the report of Mr. A. J. Robinson on the competitive test on the Roebling wire partition, he states: "I found, where I could observe it, that the wire was badly corroded where the patent plaster had been used."

Dangerous Plasters.

The principal cementing material of the patent plasters, or so-called hard plasters, is "gypsum" or "plaster-of-Paris," known chemically as sulphate of lime, and according to a recent authority* its chemical analysis shows acid, 46 parts; lime, 32 parts; water, 22 parts.

In the discussion on the care and maintenance of bridges Mr. Theodore Cooper states as follows:—

"Ordinary commercial sulphur generally contains sulphuric and sulphurous acids, produced by the oxidation of the sulphur during its process of sublimation. These acids are the immediate corroding agents when the impure sulphur and iron are in contact."

"In general the rusting or corrosion of iron only takes place in the presence of an acid and moisture. In dry air at common temperatures, or under pure water free from air and carbonic acid, iron does not oxidize. Neither does it oxidize in dry carbonic acid

gas; nor to any great extent, if at all, in damp oxygen. But in the presence of moisture and many acids the corrosion takes place readily and continuously."

Thus, according to this authority, in the "presence of moisture and many acids the corrosion takes place readily and continuously." The patent plasters contain both the moisture and the acids necessary to start the corrosion.

One of the claims of the various patent plasters is that by the use of their material the plastering of a building can be done so much quicker from the fact that their mortar becomes hard, or "sets," in a few hours, and in many cases the white coat is applied the following day. Although the patent plasters "set" and become hard, they are not dried out, because it requires just as much water to put the patent plasters in a plastic condition ready to be applied to the iron lath or wire as it does to make lime mortar in the same condition, and it is the universal custom to allow the lime mortar to dry out thoroughly or become "bone dry." Thus, at the time the lime mortar is coated with the white coat the lime mortar in contact with the metal lath or iron wire is dry. On the contrary, the water in the patent plasters is not dried out, and there is moisture or water in the patent plasters in combination with the "sulphate of lime" and other acids used in the preparation of the patent plasters.

The Simplest Proof

that patent plasters corrode iron and steel is the fact that the operative plasterers find that when they leave their steel tools in the patent plasters overnight they are found to be corroded the next morning.

Mr. W. B. Corney, of the firm of W. B. Corney & Brother, plasterers, says that he had repaired a ceiling of a building situated on Sixth Avenue, New York, at about Thirteenth Street, and found that the metal lath was entirely corroded and gone, and there was nothing but a shell of plaster composing the ceiling. He further stated that the plaster was a patent plaster.

An Interesting Test.

A test was made at additions to the Metropolitan Life Insurance Company's Building on Twenty-third Street, New York City, to determine the corrosive effect of plastering materials upon metals. Pieces of cast-iron were broken, and a plastering material consisting of lime mortar and Portland cement was applied to the clean, bright fracture of one piece, and a sample of patent plaster was applied to the clean bright fracture of another piece. About a month after, the two samples of plastering material were removed, and the piece of cast-iron to which the cement-gauged lime mortar had been applied was as clean and bright as when first broken; but the second piece was corroded.

Obituary.

Mr. John P. Seddon, F.R.I.B.A., died last week. (See p. 80.)

Mr. Benjamin Hannen, head of Messrs. William Cubitt & Co., the well-known firm of contractors, died recently, aged 76.

Mr. George Miller, retired builder, of Coat-bridge, N.B., drowned himself last week by deliberately plunging his head in a tub of water. He was 63 years of age.

Mr. L. Ingleby Wood, architect, of Edinburgh, died last week. He produced a series of black-and-white studies of "Vanishing Edinburgh."

Mr. William Reid, of Fraserburgh, died recently, aged about 41. He was architect for Lord Saltoun. Many of the chief buildings erected in Fraserburgh in recent years were designed by him.

NOTES ON COMPETITIONS.

The Acton Municipal Buildings Farce.

The latest act of the farce of the proposed municipal buildings at Acton has just been played. The lowest tender for works which were expected to cost some £10,000 has come out at close upon £60,000. The ratepayers have condemned the whole scheme, and the district council has at last decided not to proceed with it. There is a universal feeling in the neighbourhood that everybody has been trifled with, and the chairman of the district council at its last meeting stated that he considered the council had been led astray. And so the fears entertained by those whose knowledge of the subject entitled them to an opinion that the most suitable design had not been selected out of the limited number submitted in competition have been justified by the result. As far as one can remember (it is over two years since the competition was held), the assessor awarded the first place to a design which showed the town hall upon the front, because he considered that position the most suitable, in spite of there being no requirement to that effect in the conditions. The frontal position was afterwards abandoned and the Town Hall relegated to a quieter spot, where in fact it had been shown by the majority of the unsuccessful competitors. The conditions gave the cost of the proposed building at 1s. per cub. ft. Some of the designs submitted could have been undoubtedly carried out for that sum, especially when it is borne in mind that there were those among the competitors who had erected municipal buildings at a similar price. It has been contended over and over again that it is a duty of the assessor to ascertain that the designs selected by him can be carried out for the stipulated sum. The neglect to do so is widespread in its evil effect, causing dissatisfaction amongst the unsuccessful competitors, endless trouble and frequent loss of the work to the successful, and general despair to the promoters. In this instance work which was to have cost 1s. per ft. came out at 1s. 6½d.—with what disastrous result has been already shown.

Ilford Library.

The Ilford District Council has referred back to the General Purposes Committee a recommendation that a competition should be held for the public library which it is proposed to erect opposite Ilford Station. A councillor stated that he considered the council's surveyor should prepare the plans, and that £300 would be saved thereby. The seconder of this proposition said he thought they would not get an architect to draw better plans than their own surveyor would do. If £300 is the amount estimated by the Ilford Council as the cost of a competition, the assessor and the competitors should fare well in fees and premiums. Ilford is not likely to require a library costing more than £6,000. The proposed site is a fine one at the apex of two roads, and occupies a prominent position opposite the station. It will be to the best interest of the district that the General Purposes Committee upholds its resolution.

New Church at Blackpool.

One of the quaintest competitions which has appeared for some time was advertised recently in the "Blackpool Gazette," where designs and estimates were invited for a proposed new church to be erected on the site of the St. Peter's Mission Church at South Shore. Particulars were to be obtained of the vicar, and were issued by him in the form of a letter containing a sketch plan and elevations from his own pen. The only conditions are that a church and schoolroom are required, that the nave is to have seating accommodation for 500, and that something good and cheap is wanted. There is such an

* Millar, "Plain and Decorative Plastering."

evident desire here to conduct a competition on the most economical lines, even at the cost of much time and labour on the part of the vicar, and his methods are so obviously the result of ignorance of what is best for himself and his parishioners that one is constrained to refrain from scoffing. The matter does not seriously affect architects, for no one with any self-respect would think of competing, but it does affect architecture in that the result will probably be another of those structures which disfigure so many neighbourhoods, and which lack alike proportion and all elements conducive to devotionism. The vicar is evidently unaware that these qualities are not incompatible with plainness and cheapness, at the hands of an architect in sympathy with his work, and he would be well advised to reconsider his method if he is desirous of obtaining a church worthy of the name.

Library, Pemberton.

The eight competitive plans submitted for a new library at Pemberton have been referred by the Library Committee to an assessor to place the first two in order of merit.

School at Greenock.

The council of the Edinburgh Architectural Association have written to the Greenock School Board protesting against the conditions in the competition for a new school at Cartburn.

Stockport Isolation Hospital.

Mr. G. H. Brady, Mr. C. A. Locke and Mr. A. G. Wilkinson—all of Stockport—have been awarded the first, second and third premiums respectively for the block to be added to the isolation hospital at Dialstone Lane, Stockport, at a cost of £2,000. There were nine competitors (invited), and the assessor was Dr. E. Seargeant, medical officer of health for Lancashire.

Assessor for Oldham Library.

Mr. G. H. Willoughby, F.R.I.B.A., of Manchester, has been appointed assessor in the competition for the Carnegie free library to be erected at Crompton, Oldham.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

Damp-proof Floor: Underground Tank.

ST. ALBANS.—K. writes: "(1) In a ground-floor room of a house, on a bed of hard-rammed dry clay, a 6in. Portland cement concrete bed (1 to 5) is laid, in which 2in. by 2in. deal dovetail-section battens are bedded flush with the surface at 15in. centres. When quite dry the whole is twice coated with boiling gas-tar, and 1½in. grooved and tongued deal floor-boarding is nailed to the battens. Would this be damp-proof, and if so, is the boarding liable to dry-rot? (2) Does linoleum, laid upon a wooden floor as above or upon an ordinary wood-joint floor, cause the floor-boarding to rot? If so, is there any preventative—such as an under-lining to the linoleum? (3) Would a galvanized sheet-iron tank, buried in the earth as a rainwater store, be liable to quickly become unsound and leaky?"

(1) Though I should personally prefer a foundation of hard rubble in place of the clay, I see no reason why the proposed floor should not be both damp-proof and free from dry-rot. Special "breeze" bricks are more durable in such a position than deal dovetailed battens, and can be nailed to with equal ease. (2) Linoleum upon such a floor as the above or upon any wooden floor which is not very thoroughly ventilated on its underside will undoubtedly cause rapid

decay, because it is of such an impervious nature that it admits of no ventilation. (3) A galvanized sheet-iron tank would last a considerable time in such a position as you describe, but it is hardly designed for such a purpose. A properly constructed brick or concrete tank would cost a little more, but is more suited for the purpose; or, if you must use iron, covered "ship's tanks," 4ft. cub. of ½in. plate, can be purchased very cheaply and are to be preferred to the ordinary galvanized tank. F. S. I.

Claim for Interest on Unpaid Contract Balance.

LEX writes: "A builder contracts to erect and complete a building of considerable size, advances to be made in the usual way. The balance, a large one, has been withheld by reason of the architect not having given the final certificate, only because the client was unprepared to pay it. Can the contractor claim interest on the unpaid balance; if so, from how long after the building was completed; and does the R.I.B.A. recognize any custom in this respect? The date for payment of balance was not specially mentioned in this agreement."

Surely if the work was of considerable size there was a proper written contract, and if so, that must form the basis of any claim you have upon the building owner. The usual term for "retention money" is six months from the date of completion, and if that period has expired you have reasonable grounds for demanding a settlement—firstly from the architect (for final certificate, &c.), and secondly from the building owner. You cannot claim interest as you suggest, but you are entitled to the balancing amount of your contract if all the other conditions have been fulfilled. Let your solicitor see all the papers connected with the case before you take any action. F. S. I.

Calculations for Oval Sewer.

CONSTANT READER writes: "In calculating the discharge and velocity of circular sewers, (1) what is a simple formula for getting the length of the wetted perimeter at any depth of flow in the sewer, (2) the sectional area of sewage, (3) formula for velocity and discharge, (4) formulæ for calculating the size of opening required to pass a given number of gallons of water per minute? Having a regulating weir 18ins. wide fixed in a channel, what would be the height of opening required to pass, say, 130 gallons per minute?"

There is no simple formula for obtaining the correct length of wetted perimeter at any depth of flow, nor for finding the sectional area of a sewer. When flowing half-full the wetted perimeter will be approximately equal to 1.9 D, where D = diameter or width of standard sewer; and when flowing two-thirds full the wetted perimeter = 2.39 D. In the first case the sectional area of flow will equal 0.509 D² and in the second case 0.756 D². A useful formula for the calculation of the discharge from drains and sewers is that of Eytelwein, as follows: $Q = A \sqrt{x} \times 2f \times 55$, where Q = discharge in cubic feet per minute, A = sectional area of sewage flow, x = hydraulic mean depth (i.e., sectional area of sewage flow divided by wetted perimeter), f = fall in feet per mile, and 55 is a constant, but there are more accurate formulæ than this one, although they are more complicated. The velocity of flow in feet per minute may be found by dividing the discharge in cubic feet per minute by the area of flow in square feet. In answer to another question, Beardmore's rule for the practical discharge of water through ordinary sluices is $C = 300A \sqrt{H}$, where C = discharge in cubic feet per minute, A = area in square feet, H = head in feet. When the outlet is "drowned" the head will be the difference in level between water over inlet and outlet.

HENRY ADAMS.

The Influence of Aspect upon Design.

CHEETHAM. — STUDENT writes: "I am obliged to Prof. Henry Adams for his reply to my question concerning façade design on p. 37 of your issue for January 17th, but owing to the manner in which I put the question I have not yet elicited the information I desire. My question ran as follows: 'In what way should the aspect of a façade govern its æsthetic design?' This I now realize to be ambiguous. My query arose from reading the following words of Mr. John Belcher in the Institute Journal of February 11th, 1905: 'You should also have regard to the aspect of the building you are studying—whether it is situated in the narrow street, the broad thoroughfare or the open ground. Note how the projections and lights and shadows are determined on each frontage. Where the sun penetrates reflected light may be taken advantage of. Projections and shadows on a south front are by no means the same as they would be with a north aspect. How well Vanbrugh, amongst others, understood this! I mention Vanbrugh because his insistence on this point is so obvious.' What I desire is to elicit a few practical instances of how the aspect ought to determine the architectural treatment, and also some elucidation of the sentence that I have underlined. Possibly some of Vanbrugh's examples might be explained. This is a question in which much interest is taken not only by myself but by others also; and an explanation would be greatly appreciated."

Shadows are seldom studied in external design in this country, and the reason may be sought in the fact that the leaden skies and changing lights of northern climes would render any definite scheme on a large scale only fitfully seen. With clearer skies and greater intensity of light greater attention may be profitably paid to all the little details and to larger composition in shadows. On a north front the whole surface is in shadow, and thus definition is only obtained by reflected and diffused light, and thus greater projection and coarseness of detail will be necessary to give sharp and clear definition of parts that will be necessary on a south front. Mouldings need to be more prominent and hollows deeper, sculpture in higher relief, on a north face than on the south. Roughness of surface and intricacy of detail would be toned down by the duller lighting, whereas it would be distressful on a sunlit front. On a south front, too, in bright sunshine shade will be restful, and intricate forms such as sculptured friezes should be looked at in the shade, and simple geometric forms such as mouldings used in the light to give proportion, balance, rhythm and definition of parts and their purpose and importance. Heavy cornices or wide overhanging eaves are pleasing here, and shadows cast over windows have their utilitarian aspect, and porticos are often adopted to give shelter from the sun rather than from rain.

Architectural Censorship was the subject of a paper read recently by Mr. J. Campbell Reid before the Glasgow Technical College Architectural Craftsmen's Society. Mr. Reid advocated the appointment of small committees for each district of large towns, who would form an Architectural Court, before whom all plans for proposed buildings would be submitted after having been sanctioned by the Dean of Guild Court. These committees would refer any schemes opposed to architectural principles to the censor, who would be an architect or artist of repute appointed by the Government, and whose decision would be final. Mr. Reid also advocated the laying-out of new streets by architects, who would introduce more varied lines than those laid down by engineers and thus relieve the monotony of many of our thoroughfares.

THE ARCHITECTURE OF SOUTHERN FRANCE.

A paper on "The Architecture of Southern France" was read by Mr. A. Needham Wilson, A.R.I.B.A., before the last meeting of the Leeds and Yorkshire Architectural Society. Mr. Wilson said that a student visiting the south of France for the first time could not fail to be struck by the examples of Romanesque architecture more than by anything else, and in Provence he would be bewildered by the impression that no intermediate styles seemed to bridge the gap between the degenerate Romanesque and the late Gothic, or even the Renaissance. To deal with the subject as a whole would hardly come within the scope of a single paper. Therefore Mr. Wilson said he would deal in particular with

The Romanesque in Provence.

Viollet-le-Duc had said: "The few fragments of architecture which remain to us of the sixth and seventh centuries are but pale reflections of the Roman art, often as débris thrown together haphazard by unskilful workmen executing masonry or brickwork with much difficulty." In Provence, as well as in its vicinity, many buildings appeared to incorporate Roman fragments. They were told that these were slavish copies, but it would be wrong to jump to too hasty a conclusion on the point. There were such typical examples as the porches of Notre Dame at Avignon and at Aix in Provence which appeared to bear the stamp of Roman work, but a little consideration would tell us that they were but slavish copies. Coming nearer, we found a delicacy of execution which seemed to indicate that they

were either genuine Roman fragments or copies by craftsmen who were certainly not ignorant of traditional training; also the positions occupied by these fragments frequently indicated an incongruity of treatment quite incompatible with original work. One of the first problems which confronted the Provençals was the covering of their buildings. The country produced no suitable timber, but stone in plenty. The school of Provence contented itself with the simple pointed barrel-vault, over narrow low naves only, trusting to the massiveness of the walls to resist the thrust, or, where aisles were adopted, formed a kind of continuous flying buttress, raising the wall over the arcades sufficiently to be pierced with windows.

A.A. OLD DAY STUDENTS' CLUB.

THE fifth annual dinner of this club was held at the Florence Restaurant on January 26th, when thirty gentlemen were present, including Mr. E. Guy Dawber (who presided) and Mr. H. Tanner, junr., hon. secretary of the A.A., who was present as a guest of the club. In responding to the toast of the "A.A. and the Day School," Mr. H. P. G. Maule, the master, briefly ran over the history of the school from its inception in 1901, paying special attention to the numbers working there at different periods down to the present total of thirty-seven in the first year and eighteen in the second year. He drew attention to the fact that the scheme of work now followed was almost identical with that planned by Mr. A. T. Bolton at the beginning (Mr. Bolton's name being received with general

applause), and noted with pride that in the Institute studentships just awarded seven out of the eleven had been made to A.A. men. Mr. Dawber then rose to propose "The Club," to which toast Mr. Travers, the hon. secretary, replied. Other toasts were given, and a musical programme completed a most enjoyable evening.

"ENGINEERING GEOLOGY."

Building Stones.

IN the second of a series of lectures on "Engineering Geology" which he delivered recently before the Aberdeen Association of Civil Engineers Mr. George Gregory, junr., civil engineer, said it was stated that a proper knowledge of the physical properties of building stones could only be obtained by an examination of their structure under the microscope, but, unfortunately, this method of treatment had not found its way into practical books dealing with building stones. The study of petrology, as far as the practical determination of the relative values of building stones was concerned, was so easy that even a beginner could with the aid of a microscope distinguish the differences of structure and composition. Stones from the igneous rocks were of most interest to engineers, as from such were obtained the best materials for street-paving and macadam and the best and most durable stones for heavy engineering purposes. The derivative rocks, on the other hand, appealed most to the architect, as they furnished those materials which combine a high degree of durability with ease of working and facility for being shaped into sculpture and ornamental work.

CATAFALQUE AT THE SHEFFIELD CREMATORIUM.

DESIGNED BY C. M. HADFIELD, ARCHITECT, AND EXECUTED BY THE BROMSGROVE GUILD OF APPLIED ARTS.

This catafalque was designed with the twofold object of securing a seemly and dignified resting-place for the remains during the reading of the burial service and of forming a casing to the iron framework and mechanism used for drawing the coffin into the furnace chamber at the words of committal. The design was influenced by the style of the existing chapel and buildings, and was based on the type of late fifteenth-century altar tombs. The length is 13ft., width 4ft. and height 3ft. The work was executed throughout in cast bronze by the Bromsgrove Guild of Applied Arts to the design of Mr. C. M. Hadfield, architect, of Sheffield.

Law Cases.

Important Question for Scottish Builders.

—In the Edinburgh Court of Session recently an important case was heard by the Lord Justice Clerk, Lords Kyllachy, Stormonth Darling and Low. Miss Elizabeth Wilson and Mr. A. Walker, quarryman, of Stonehouse, contracted with Weir & Hamilton, builders and contractors, for the erection of certain tenements at Green Street, Stonehouse, according to plans and schedules prepared by an architect employed by the plaintiffs. In the schedules the architect stated the chimney stacks at a rate per square yard. This, it was alleged, was contrary to the prevailing practice in the West of Scotland, where the work in question was always scheduled per square foot. Of the six contractors who tendered for the work, three, observing the change, inserted in their price schedule a rate applicable to the square yard, but the other three, of whom the defendants were one, inserted a rate per square foot, acting on the erroneous assumption that this was what was wanted. The defendants were the successful tenderers, and on the completion of the work it was measured by the architect, who in his final measurement inserted a price per square foot for the work performed, thus paying the defendants at a rate nine times in excess of the price quoted by them per square yard. The appellants paid the contractors the sum brought out by the architect in his final measurement. Alleging that they had subsequently discovered from the reason just mentioned that an overpayment of £78 had been made, they brought an action asking for repetition of the money. The defendants alleged that the plaintiffs were aware of the mistake into which they had fallen by reason of the unusual method of scheduling the work in question, but, after proof, Sheriff-Substitute Thompson granted decree in favour of the plaintiffs, with expenses. On appeal, Sheriff Guthrie reversed, and assoilized the contractors. The plaintiffs, therefore, appealed to this Court, and after hearing counsel their Lordships affirmed the judgment of the sheriff, with expenses.

Building By-laws Prosecution. — At Newport Pagnell Divisional Petty Sessions recently George Henry Transfield, builder, Bradwell, was summoned by the Newport Pagnell Rural District Council for various offences against the Public Health Act, 1875, and the council's by-laws pursuant thereto. There were nine counts in all. The first five counts, which related to two lock-up shops in Queen Ann Street, Bradwell, were reduced to four. It was alleged by the prosecution that the plans submitted to the council were incomplete and not in accordance with the by-laws, and that the buildings actually built were not in accordance with those plans. The second information was that there had been no covered drain construction for the premises. The third count was in regard to the sanitary conveniences. The plans deposited with the council did show these conveniences, but the houses when built were without them. The fourth summons was in respect to the water-supply. Defendant applied for the usual certificate, but was refused because there was not a fit and proper supply of water available. Defendant, however, permitted the occupation of the premises. For the defendant it was submitted that there had been no substantial deviations from the plans, and that he was well within his rights in what he had done. He had not constructed a covered drain because he thought of taking advantage of the system of combined drainage which obtained in the village. With regard to the water-supply, there was a well within 15ft. of the house, which it was argued was within a reasonable distance as required by

the Act. Moreover, the inmates of the shops did not use the water for domestic purposes. The magistrates decided to dismiss the first three cases and impose a fine of 6d. and 8s. 6d. costs in the fourth (the water-supply). The Bench were asked to state a case on those dismissed, which was granted, and the remaining four summonses were withdrawn.

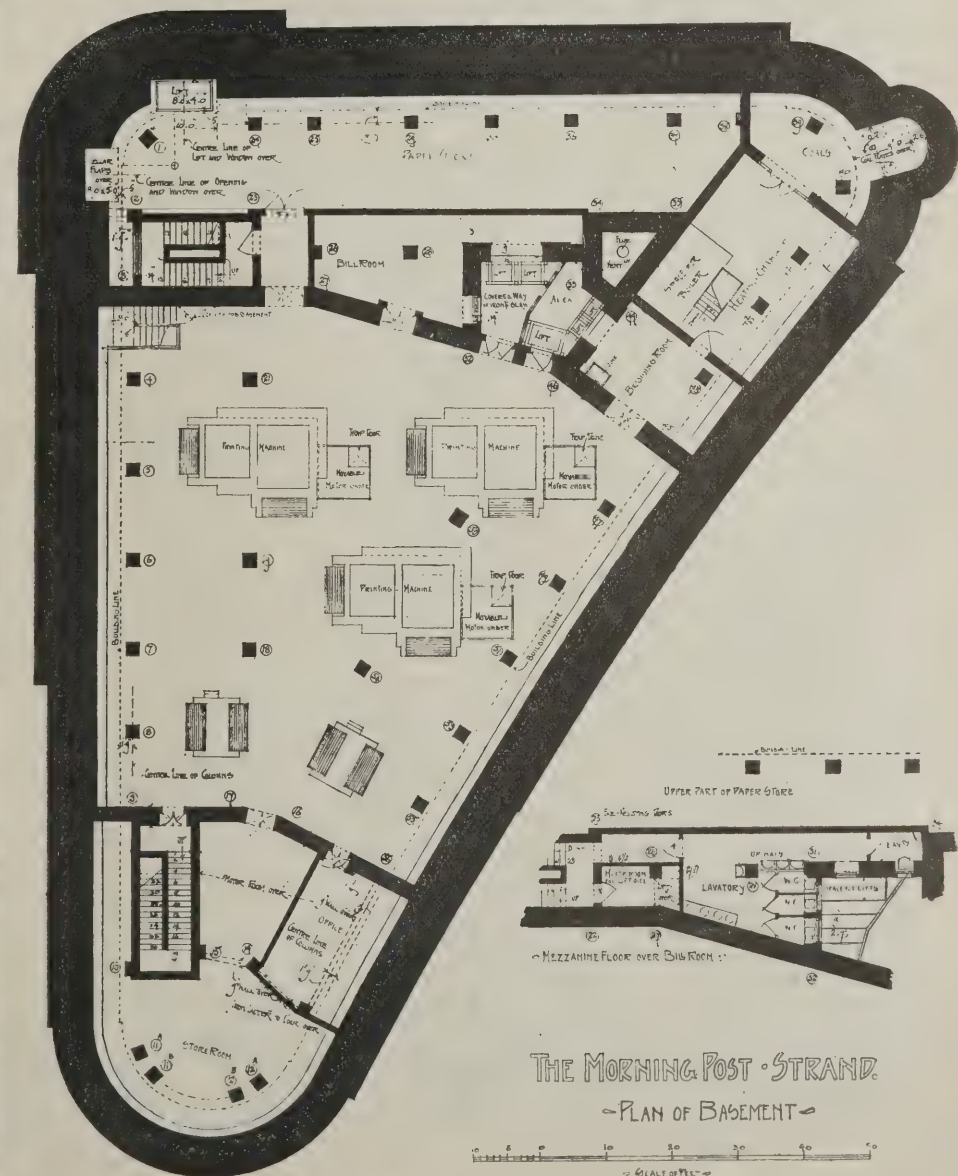

An Architect's Certificate in Court. — In the Scottish Law Courts recently a case was heard in which cross actions were brought by Messrs. Donaldson & Co., motor-car repairers, of Edinburgh, and Messrs J. R. & E. E. Pearson, architects, of Edinburgh, in respect of new motor-car works for Messrs. Donaldson, who sued for £128 10s. The builder had received a final certificate for £240 9s. Messrs. Donaldson paid £100 to account, but objected to pay the balance on the ground that the work was not in accordance with the contract, and that considerable deductions fell to be made from the architects' measurements. The builder sued Messrs. Donaldson, who consented to decree being pronounced against them for the sum sued for under deduction of £10. Messrs. Donaldson stated that they were legally bound to pay the builder, as he had received a certificate from the architects. They now sued Messrs. Pearson for the amount paid to the builder, which they held should not have been passed by the architects. The architects denied liability, and claimed from Messrs. Donaldson £40, balance of commission

alleged to be due; £10 10s. for preparing a second set of plans; and £2 2s. for revising and examining the feu charter. The judge found that Messrs. Donaldson were entitled to decree against the architects for £72 5s. 1d., and that Messrs. Pearson were entitled to decree for £40, leaving a difference of £52 5s. 1d., which Messrs. Pearson would have to pay.

A new School at Sheffield, to accommodate 700 children, has been erected at a total cost of £15,220. It is a one-storey stone building, designed by Messrs. Holmes & Watson, of Sheffield.

A new Altar and Super-Altar in Holy Trinity Church, Tresillian, was dedicated recently. The altar is of carved oak, having the Agnus Dei in the centre, with alternate panels of vines and wheat on each side. The work was designed and carried out by Mr. Harry Hems, of Exeter.

New Schools at Dawpool, Cheshire, have been built to accommodate 104 children, with a master's residence attached. The main schoolroom is 50ft. by 22ft. and 20ft. high, with classroom 20ft. by 19ft. by 16ft. high. The building is faced with red bricks and terra-cotta, with red-tiled roofs, by Mr. Edwards, of Ruabon. Mr. J. Francis Doyle, of Liverpool, was the architect and Messrs. John Thomas & Sons, of Oxtou, were the builders.

OUR PLATES.

THE design for the new "Morning Post" building which is to be erected at the conjunction of the Aldwych crescent with the Strand has been prepared by Messrs. Mewès & Davis, architects, of 6, Dean Street, W. In the basement (see preceding page) will be the printing machinery. The principal feature of the ground floor, illustrated on page 79, is the large advertisement department, which is to be decorated in Louis Seize style. The first floor, the plan of which is also shown on page 79, will be occupied by the editorial offices, while the second and third floors are to be let out as offices. The fourth and fifth floors will be occupied by the composing department. The whole of the building will be of fire-resisting construction, on lines similar to those adopted at the Ritz Hotel. The three façades will be executed in grey Norwegian granite, to be supplied by Messrs. A. & F. Manuelle, of Gracechurch Street, E.C. The general contractors are the Waring White Building Co., who secured the job in a limited competition. The names of the tenderers and the various amounts are as follows:—

Pierce & Co., New York	-	£160,730
Foster & Dicksee	-	148,493
Trollope & Sons, Ltd.	-	845,850
Higgs & Hill	-	137,000
J. Carmichael	-	135,220
Holloway Brothers	-	132,400
Waring White Building Co.	-	129,279

EGYPTIAN BRICKWORK.

EGYPTIAN brickwork was dealt with by Prof. Capper at the Manchester Municipal School of Technology last week. The Egyptians, he said, were masters of the art of brickwork. They were distinctly successful in adopting various expedients for the actual work of construction and for doing away with elaborate scaffolding. In the latter connection a rather ingenious theory had been advanced, namely, that it was the custom of Egyptian builders to erect their walls step-shape to the full height, and then working downwards to gradually fill up the spaces. This theory, he believed, was borne out by the appearance of the walls. A peculiar phenomenon in connection with many Egyptian walls also was the appearance of the curved lines or "sagging" in the brickwork. This, he said, had been attributed first to the fact that sunburnt bricks were employed instead of the kiln-made article, and, secondly, to the loose condition of the foundation. The Nile floods in all probability had also contributed to the "sag."

PHENE SPIERS TESTIMONIAL.

THE executive committee of this testimonial, having now closed their accounts, state that after paying all expenses there is a balance to the credit of the fund of £79, and that only 124 copies of "Architecture, East and West" remained unsold at Christmas last. The committee have handed over the balance of £79 to Mr. Spiers to deal with in any manner he thinks fit (though we understand that Mr. Spiers is going to devote the money to a useful architectural purpose), and have instructed Mr. Batsford to transfer the remainder of the edition of the book to Mr. Spiers' account. This settlement of the matter may be looked upon as highly satisfactory to all parties concerned.

THE NEW "MORNING POST" BUILDING LONDON: ELEVATION TO WELLINGTON STREET. MEWES AND DAVIS ARCHITECTS.

Notes and News.

The Year-Book of the Society of Architects for 1906 has just been issued, price 2s.

North-West Durham Master Builders' Association.—Mr. J. Eltringham has been elected president of this Association for the current year.

Sending-in Day for the next Academy.—Friday, March 30th, is the sending-in day for architectural works for the next Royal Academy exhibition, from 7 a.m. to 10 p.m. as hitherto.

The Carpenters' Company have arranged a series of lectures to be delivered at their hall in London Wall. Particulars as to dates and subjects will be found in our list of "Coming Events."

A new Cement, said to be waterproof, fire-proof, insoluble, a non-conductor of electricity and a substitute for white lead, has been invented by a Mr. C. W. Dopson. It is styled "Cæmentum."

Ilkley Town Hall.—The foundation-stones of the free library, public offices and assembly hall to be erected in Station Road, Ilkley, from designs by Mr. W. Bakewell, F.R.I.B.A., of Leeds, were laid on January 31st.

The removal of the Roof of Charing Cross Station, now proceeding regularly, involves taking down the thirteen principals, each weighing about 14 tons, twenty-four lattice girders, and eighteen purlins. Not the least difficult part of the work will be the removal of 85,000 sq. ft. of glass and zinc covering, weighing about 250 tons.

A Gigantic Hydraulic Testing Machine is being constructed by Messrs. W. & T. Avery, Ltd., for the Engineering Section of Birmingham University. It is designed for testing whole members of constructional work, such as complete girders, columns, roof principals, &c. The maximum capacity is 300 tons, the total length 70ft., and the weight of metal in the machine about 85 tons.

A.A. Students' Smoking Concert.—In the Georgian Hall of the Gaiety Restaurant last Friday a smoking concert was held by the students of the Architectural Association. A long and excellent programme was gone through, and not only was the evening very successful from a social standpoint, but as the outcome of it Mr. Wilfrid I. Travers, the hon. secretary, states that £15 will be handed over to the Architects' Benevolent Society.

The new North Riding County Council Building at Northallerton was formally opened last week. The building was illustrated in *THE BUILDERS' JOURNAL* for October 19th, 1904. Mr. Walter H. Brierley, F.S.A., of York, was the architect, and Messrs. J. Howe & Co., of West Hartlepool, were the contractors. The furnishings were carried out by Messrs. Goodall, Lamb & Heighway, of Manchester; and the electric-light fittings (designed by the architect) supplied by Messrs. Singer, of Frome. The total cost has been £33,000.

Welsh Slate Trade.—The foreign demand for slate has a little more brightness about it just now. Many causes are given for this. Some declare that it is temporary, and that it is due to the increased tariff which comes into force on the Continent in March. It is said that Germany proposes doubling the duty on foreign slate after March. The home demand, however, shows no improvement whatever. The question of prices hardly affects the sales at all, it being purely a matter of consumption. In fact, no improvement can be expected until the building trade sufficiently revives to embrace operations on a large scale and employment is more settled. Full time is being worked at all the quarries, except two or three of the small ones, but the number of men has been reduced in most of the works, whilst wages are 10 per cent. less than they were six months ago.

Commendatore Boni's Latest Investigations in the Roman Forum indicate that the Roman buildings of the first century are built of tiles, not bricks.

Mr. G. T. Forrest, of Wakefield, has been appointed architect to the Northumberland Education Committee at a salary of £250 per annum.

Mr. George Macfarlane, of the firm of Messrs. G. Macfarlane & Son, builders and contractors, Manchester, has been elected president of the National Federation of Building Trades' Employers of Great Britain and Ireland for the ensuing year.

The State Capitol at Albany, New York, which though not yet completed has cost £5,000,000, is in danger of collapse. There have been cracks in the walls for years, and the mammoth stone staircase and the entrances have recently been closed. There is a report that the entire building is settling.

The Cutting of Prices for Contracts.—At last week's annual dinner of the Bradford Master Builders' Association Mr. Paul Rhodes, president of the Yorkshire Federation of Building Trade Employers, said he hoped that something might be done by combination to put a stop to the senseless cutting of prices in contract work.

Payment of London District Surveyors by Salaries instead of by Fees.—This proposal of the Building Act Committee was discussed at last week's meeting of the London County Council, but, by fifty-nine votes to forty-nine, was referred back for further consideration. Full particulars of the scheme were given on p. 61 of our issue for last week.

"Builder's Baby," said Alderman Oddie at last week's meeting of the Blackburn Town Council, was the trade name for the irregular-shaped useless bits of land which were often left when building schemes were completed. One such piece had been offered to the Corporation for a recreation ground at twice the price asked for building purposes, but the council decided to await an amended offer.

A Museum of Irish Building Materials.—At the recent quarterly meeting of the Dublin Industrial Association reference was made in the secretary's report to the arrangements made by the Architectural Association of Ireland for starting a museum of building materials. This would be extremely useful to the building industry, and would serve as a trade exhibit to those whose desire it was to procure Irish building materials.

Great George Street Congregational Church, Liverpool, has been re-seated throughout with American oak seats of a specially comfortable character, and re-lighted, reheated and decorated throughout. The organ also has been renovated and decorated. Mr. J. Francis Doyle, of Liverpool, was the architect in charge of the work, the decorators being Messrs. S. R. Henshaw & Sons, of Liverpool.

Society of Engineers: President's Address.—Mr. Nicholas J. West delivered his presidential address to this Society on Monday evening. Reviewing the notable engineering achievements of the past year, he alluded to the erection of the bridge over the Victoria Falls in Rhodesia (by Sir Douglas Fox and partners), the boring of the Simplon Tunnel (which would shorten the distance between Calais and Milan by eighty miles), the enormous new dock at Salford, and the electrification of the Metropolitan and District Railway (the generating station for which, at Chelsea, was the largest of its kind in the world). Finally, he dealt with the question of engineering education, observing that the Institution of Civil Engineers were now moving in the matter, and as theirs was the opinion most likely to carry weight, they should be cordially supported by all engineers.

A new Episcopal Residence at Southwell is being built from designs by Mr. W. D. Caröe, F.R.I.B.A. The foundation-stone was laid last week by the Bishop of Southwell. The new house has been planned so as to incorporate the ancient hall which was restored by Bishop Trollope in 1884, as well as the old palace now in ruins.

A Scottish Garden City Scheme.—At the Greenock Dean of Guild Court last week Mr. Robert M'Alpine, railway contractor, made application for a warrant to proceed with the erection of four blocks of houses in the east end of Greenock. The plans provide for four single shops, twelve houses of three apartments, and 192 houses of two apartments, giving accommodation for about 1,000 persons in one large and three smaller blocks four storeys in height. The houses are intended for the working classes, and will be of advantage principally to artisans working in Port Glasgow.

New Infants' Schools at South Shields have been erected from designs by Mr. J. Walter Hanson, architect, of South Shields. The buildings are in Gilbert Street, and accommodate about 450 children. There is a central hall 71ft. by 26ft. by 19ft. high, with seven classrooms around, four of them being 23ft. 6ins. square, two 27ft. 10ins. by 19ft. 6ins., and one 21ft. by 23ft. The sanitary fittings have been supplied by Messrs. Adamsez, Ltd. Ventilation is on the plenum system by Mr. William Key, of Glasgow and London. The contractors for the schools were Messrs. Glen & Moffett, of Jarrow, the contract price being £5,516.

CONDITIONS OF CONTRACT.

SPEAKING last week at the annual dinner of the York Master-Builders' and Contractors' Association, Mr. F. Raney referred to the conditions of contract which had been adopted by the R.I.B.A. and the National Federation of Master-Builders. Whilst they agreed *in toto* to the principles laid down in that document, there was some slight difference of opinion as to the most suitable form which could be adopted for local requirements. Some of them felt that the agreements were drafted to meet the requirements of a section of the building traders who did not probably carry on their business on methods the same as was done in that locality. Locally, he and his colleagues would like to see a revision of that so as to have the conditions more adapted to local use, and he thought there should be a conference between them and representatives of the master-builders. One of the things that architects were agreed upon was that quantities should form part of the contract.

Federation in the Building Trade.

Mr. A. W. Sinclair, vice-president of the Yorkshire Federation of Master-Builders, congratulated the York master-builders in joining the larger federation eight years ago. Looking back, he wondered that so much had been done in that time for the building trade. They had now extraordinary power compared with what they had before they federated. During the last five years they had had no disputes of any moment, and the reason was that builders had become strong and powerful. There were about 3,600 builders in the Northern Counties Federation, and when occasion arose and the cause was a just one they acted in concert for their own rights. They repelled all unfair demands, and the men had been positively startled when they knew the power that was behind the employers. But it was one of the delightful things in connection with the federation that whilst they had great power, they had endeavoured to act fairly and squarely so far as they could with the men, realizing that what was good for one was good for the other.

R.I.B.A.

Royal Gold Medallist; President's Address to Students.

A MEETING of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the chair being occupied by the president, Mr. John Belcher, A.R.A.

Mr. Alex. Graham announced with regret the death of Mr. John P. Seddon, F.R.I.B.A., for many years a member of the council of the Institute and hon. secretary 1862-67. Mr. Seddon was 78 years of age. He was a Gothic architect who followed strictly in the school of Pugin. A vote of condolence and sympathy with his widow and family was passed.

It was announced that the council would submit the name of Sir Lawrence Alma-Tadema to His Majesty the King as the fit recipient of the Royal Gold Medal for 1906.

Criticisms of Students' Designs.

Mr. John W. Simpson, F.R.I.B.A., then read a criticism of the essays and drawings submitted for the Institute prizes and studentships this year. After observing that it would be valuable for the future if the sub-committees on whom the work of selection devolved were to have placed on permanent record their criticisms of each design submitted, Mr. Simpson said that as a whole the work sent in this year was of a high standard distinctly above the average.

For the essay prize six competitors had come forward, but the council were by no means satisfied with the literary quality of the work, which was not what it should be; this being perhaps due to the small amount of publicity the prize received. Mr. Simpson would not hazard as to how many of those present had ever read an Institute essay!

For the measured drawings prize both Mr. Coombes and Mr. Poley well deserved their success. Mr. Lovell's drawings, too, were careful, but the blacking-up of the full-size moulding profiles was to be regretted, as tints were preferable. Mr. Simpson took occasion to emphasize the importance of the choice of subject, and commended for study the splendid examples of Gothic to be found at our own doors. The need, moreover, was not for drawing only, but analysis of the design as well. The machine-like repetition of bricks in a wall and of sash bars in windows was to be deprecated.

In the Soane, Mr. George's fine production showed artistic qualities of a high degree, and was indeed the most learned parody of style we had had since Prof. Beresford Pite had startled us with his idea of what a Wesleyan club should be. Mr. Atkinson's design, honourably mentioned, was well drawn, but did not quite exhibit the necessary difference there should be between a public and a private building.

Mr. Gascoyne's studies for the Owen Jones were admirable and delicate renderings of Italian architecture, and the work of the other competitors was also very good.

For the Pugin, Mr. Drysdale had sent in delightful and effective sketches; indeed, all twelve entries were of a high standard.

Mr. Inigo Triggs had been successful for the Godwin Bursary, though there had been a doubt as to whether the laying-out of squares and public spaces might legitimately be counted as eligible for the prize.

Twenty-one designs had been sent in for the Tite, and of these the winning one, by Mr. Horsnell, was a really fine conception, though the drawing—more especially the pencil perspective—was unstudentlike and deficient.

Mr. Markham had been the sole competitor for the Arthur Cates prize, which he had won by good and honest work, while Mr. Nott's design for the Grissell was excellent. In this last connection Mr. Simpson remarked that

though this prize was primarily concerned with the study of construction, any construction which resulted in unlovely form was architecturally bad.

The president then delivered his address to students. Mr. Belcher said:—

I propose to put before you this evening a few suggestions as to the methods—or rather I should say, method—of constructive thought in design. As a matter of fact there is only one such method for any artist, whatever be the vehicle he choose to work in. The arts are all closely allied—at any rate in their methods—and the order of thought-development in each is one and the same. My friend Albert Gilbert, the sculptor, once insisted that there was another way, called

The "Fluke,"

and that he was sure from his observation a great many more designs were produced in that than in any other way. But surely this must be a libel! I will not venture on the statement that I have had no experience of that sort, but I am not anxious to talk about it, and it would not help you if I did. For the one thing the youthful aspirant needs most to have rubbed into him—in season and out of season, if necessary—is that without hard study and adequate thought he will never do anything really good.

The intelligent study of mental processes in design and the knowledge of the order of thought to be observed is not unimportant; for, though many follow this order instinctively and unconsciously, yet, seeing that our mental faculties are our armoury, it is good to know what weapons we have at our command and how and when to employ them.

I am not a philosopher—not even a psychologist; but I have observed and analysed mental processes both in myself and others; I have also gathered light from the analogy that exists in the arts generally—and so I hope that I may be able to say something on this point that will help you in your work. First of all, then, as a preliminary,

A Suitable Environment must be found.

Not necessarily a literal environment of persons, places and things, but at any rate of thought and mood. Environment is nowadays more a matter of character and temperament than of locality. Whithersoever a man betake himself it needs powers of self-government and mental concentration to escape the insistent shouts of commercialism and the prosaic business claims which are so apt to usurp an undue share of our attention. Yet, if the imagination is to be free for visions of beauty or even of dignity, if thought is to rise to the expression of noble purpose, the soul of the man must be able to take flight on occasion into the "serene" of the summer sky, leaving the earth and its cares to look after themselves for a time.

Psychologists tell us that moral education is dwarfed or even impossible unless a man has a certain amount of leisure time for the free play of his moral faculties. Certainly, too, the soul of the artist will perish within him unless he learn to withdraw himself at will into the higher realms of imaginative vision, where no sordid purpose or ignoble thought can live.

Given the right conditions, we may now proceed to analyse the working of thought in design. Let us remember, in the first place, that

Architecture "Speaks."

The power of speech—the noblest of gifts to man—is seen in all true art. In language words are symbols, and by their combination into sentences thought is conveyed, the punctuation of such sentences into primary and subordinate clauses, together with other qualities of proportion and rhythm, determining the value and relation of the several ideas expressed therein. Exactly the same in architecture—forms are combined to appeal

to the imagination and express purpose. One form of opening in a wall will convey the idea of ingress or egress, another the means of looking out or receiving light. This may be called the "simple sentence," or, if you like, the prose statement of architecture; but when we proceed to the higher forms of combination, to the moulding of these symbolic forms into sequences and rhythmic order, then we begin both to express and to appeal to the higher kind of poetical and imaginative thought.

The same laws or principles hold good for the work of the painter and sculptor, both these arts in their higher qualities possessing the power of conveying to and impressing upon the imagination much more than they actually portray.

In music we have the most ethereal medium for speaking to the heart of man. Just as poetry can convey more than prose, just as there are musical sounds too high-pitched for the ear of man to catch them, so there are thoughts and emotions "too deep for words"—for which music provides the only adequate vehicle of expression.

Architecture has been termed "frozen music." Like both music and poetry, it is subjective in its appeal; for the same arrangement of lines and colours will suggest fifty different things to fifty different persons. A fine and imaginative work will reveal to each individual some vein or mood of his own, and this above and beyond what was actually present in the mind and purpose of the architect. Every true work of art possesses an inherent energy which will sway the imagination of others and discover to them meanings of which the artist himself is unconscious.

The Imagination,

then, must be allowed a definite place both in the production of a design and in that reflection which it induces in the beholder.

A good design usually has a definite origin in a germ idea, from which, as from a bud unfolding itself, must be slowly and patiently evolved the true position and relation of the several objects and parts.

In connection with this process of evolution it is worth noting that in architecture as in language the most powerful effects are sometimes gained by the simplest means. That statement is strongest which is given in fewest words—provided the words be adequate and suitable. Why? Because the mind is quicker than the lips; because the imagination can picture more rapidly than words can paint. So in our art there are occasions when the dignified and simple statement is not only the most appropriate but also the most effective. Not that this kind of statement affords a ready escape from toil; dignity and simplicity come with experience and thought.

An essential element in the production of a design—whatever the idea and purpose of the work—is

"Feeling,"

by which either sympathy or repugnance is called into play. It is by feeling that an architect makes his selection and develops and encourages definite tastes of his own. Feeling is his own private artistic assessor, to judge in the competition of the many ideas and suggestions that present themselves before his mind's eye, as it were.

In the projection of a design on paper mental perspective plays an important part. Projected as it is on a plane surface, the relative distances of the several parts of a design can only be distinguished and appreciated at their proper value by an effort of thought. Time was, as you are doubtless well aware, when designs were produced in a kind of geometric perspective, that the author might see all round his subject; now we do this mentally or by developing each side simultaneously.

During the whole process of development

and selection the purpose of the work must be kept constantly in view, with the object of bringing out in stronger relief every feature and detail by which this purpose is to be conveyed.

The first "idea" relating to the purpose brings with it resemblances which stimulate the imagination. The interest thus awakened, backed by knowledge, provokes to further effort, in which original thought is both checked and stimulated by association and comparison, memory and imagination acting and re-acting on one another—both of them under the control of knowledge and recognized principles.

The Expansion of the Initial Thought will resemble the circling ripples produced by the stone thrown into still water—every advance leading on to some fresh development, some more extended idea.

With these expanding thoughts enter other considerations, such as questions of material and proportion of parts to the whole. Secondary causes also claim our attention as we proceed, viz., incidental local features and surroundings, contrasts, ornamentation, colour, texture, &c. These are the means which the thought of the designer marshals and controls to give expression to such intangible qualities as purpose, character, manner and disposition.

Architecture furnishes posterity—unconsciously, perhaps—with a picture of the prevailing manners, customs and conditions of life. More than that, it reveals, or it maybe betrays, the emotions and sentiments which have made each age famous or notorious. There are thoughts formulated ages ago which, having found expression in the work of the architect, are living forces to-day.

The student should be impressed with his responsibility, and so systematize his thoughts that his work may be a fitting and representative expression of the best thought of his day; for if he suffer his work to be infected with the haste and

Self-assertive Methods of Modern Life

these are bound to betray themselves in every line and detail of his design.

There is something much more subtle and mysterious in an architectural work than a mere orderly arrangement of materials. There is life and speech in it.

If a man's character may be read in his hand, certainly it may in his handiwork. The life may be noxious like that of a poisoned plant, or sweet and beautiful like that of a flower; or, again, it may resemble that of a noble tree—but life there is. The speech may be that of a Shelley or a Milton, or, on the other hand, of the most blatant type of "yellow" journal, but speak the architect's work must and will. It has a music, too, of its own—whether it be the music of one of Beethoven's sonatas or of the latest comic song.

When you realize this—and no one can be indeed an architect who does not realize it more or less—you will approach your work with that due sense of its dignity and importance in which alone you will be able to rise to the "height of the (proposed) argument"—if I may adapt one of Milton's phrases to my own purpose. A clear perception of the possibilities both of good and of evil that open before us when work is entrusted to us—in other words, a proper feeling of reverence—is indispensable if we would accomplish something noble or beautiful or even suited to its purpose.

If an architect is to speak truly—indeed, if he is to be coherent in his message—he must follow the recognized forms, the articulate phrasing, the grammatical order proper to his art. Thought-symbols, of whatever kind, are arranged in

Groups of Rhythmic Form

like musical phrases in relative keys. In architectural design this is effected by

divisional lines and grouping of parts, such divisions being regulated on principles akin to those which govern musical progression and a harmony built up of sounds.

Again, contrasts are obtained in music by the use of loud and soft passages, and effects by gradations of sound from pianissimo and fortissimo. So architecture makes use of "strength of tone," gradations being secured in this case by the measure or greatness of projections of the different parts; also by the varying plainness or delicacy of surface and detail.

I will not carry these analogies and definitions further. What I have already said is sufficient, I hope, to convince you that there are laws and principles governing good architecture, and that as nobody expects a harmony from a haphazard arrangement of musical notes, so neither will you do good work in your profession by chance combinations or random methods.

We have now come to a point when we can indeed analyse no further, for there is always

An Element of Mystery

in the best architecture—a sort of haunting personality that, ghostlike, vanishes just when we think we have it in our grasp.

This quality of "mystery"—so pre-eminent in Oriental buildings—is one to conjure with. Veiled under symbolic forms which hide as much as they reveal, it continually draws us on and as continually eludes us. The screening of parts provokes the mind to search further and deeper for that which is beyond the immediate range of vision.

Given the element of mystery—which is perhaps the "personal equation" of art—none but the trained mind can make effective use of it. The personal element is of little avail if we have not painstakingly learnt the methods and principles of our handicraft.

One of the commonest of pitfalls for youthful designers lies in certain fanciful ideas of originality. It is easy enough to be original after a fashion. Any mere novelty will serve to astonish or startle; but if we wish to appeal to the higher faculties we must be content to let our originality find expression within the lines on which those faculties themselves work.

The great German poet Goethe relates it as perhaps the greatest lesson of his early manhood—a sort of discovery that he made for himself, apparently—that if he would "find himself" and enter upon his inheritance he must recognize and submit to limitations. Originality does not involve a subversion of all that is orderly.

In music the gamut remains the same for one man as for another; certain combinations of sounds are pleasing, certain others displeasing, and will not change their character for anybody. So the architect can neither create new elements nor alter the emotional effects of combinations of elements; his hope lies in so training his powers of perception as that he can move freely and with a sure tread amongst the almost infinite variety of paths that open before him. Then he will find plenty of

Scope for Originality

without violating the canons of art or wandering into the realms of the unpleasing.

Sir Joshua Reynolds considered that "excellence is the direct result of trained perceptions." Certainly such perceptions are the foundation; any special powers or qualities that a young architect may be conscious of will find their place and expression at a later stage. You may rest assured they will not be thrust out or obscured; they will only shine all the more brightly for having submitted to limitations.

As I have said before, the character and mind of the designer will always reveal themselves in his work. The scholarly treatment of one man will appeal to the intellect, while the grace and charm which

distinguish another's work will rather sway the affections.

The highest achievement, seen only at rare intervals, lies in a combination of qualities well-balanced and under absolute control.

I have endeavoured this evening to show you that there is a certain order and development of thought in the evolution of a design.

Mere knowledge will not suffice. Something more is needed than a reproduction of the past or a mere application of mathematical formulæ. If a student labour with but little thought, he may attain to a dazzling skill, but he will neither stir the heart nor convince the mind. The search for the ideal lies ever upwards and onwards by the way of severe mental discipline. Let us remember, in the words of Philip James Bailey:—

We live in deeds, not years; in thoughts, not breaths;
In feelings, not in figures on a dial.
We do not live by heart-throbs; he lives most
Who feels most, thinks the noblest, acts the best.

A vote of thanks to the president for his address was proposed by Mr. Edmund Gosse and seconded by Prof. F. M. Simpson. Mr. Gosse divided into three classes the people who were or should be concerned with architecture—first, the large body who knew nothing about it and had not the smallest desire to know; secondly, that small division who had a love for architecture but no knowledge (in which division he counted himself); and, thirdly, the Fellows, Associates and Students of the Institute, who knew everything!

Mr. Belcher briefly replied, and announced that a special meeting would be held on February 13th, when a resolution would be put forward that a sum not exceeding £53,000 be spent on new premises for the Institute, including £15,900 for the site. The meeting then terminated.

THE LIVERPOOL TIMBER TRADE.

THE year opened with good prospects in the timber trade, owing to the continued activity in important trades of the northern counties which make large calls for timber. Building operations of a special kind, involving large contracts and a considerable use of timber for scaffolding and auxiliary work, were in progress in Liverpool and in the cotton manufacturing districts of Lancashire. Business, however, was interfered with somewhat by the elections. In Liverpool especially interest in the elections ran high. The disturbance arising from this cause followed the disturbance caused by the Dock Board election in December, in which the timber trade of Liverpool was interested through having a candidate, Mr. Holford Harrison, in the contest. The period of disturbance has therefore been of rather long duration. Yet business has had its vitality, and in spite of these distracting influences has gone on and has made a very fair start for the new year, all things being considered.

Among the later arrivals of timber have been consignments of prime whitewood boards, medium black walnut and wagon oak, by James Kennedy & Co., Ltd.; of pitch-pine planks, prime whitewood boards, walnut, elm and ash logs, pine deals, oak, battens, laths, &c., by Joseph Owen & Sons, Ltd.; of medium whitewood boards, tongued and grooved boards, oak planks and boards by John J. Swan; of teak logs, ash logs and boards by Remer & Co., Ltd.; of pitch-pine boards by Harrison, Robinson & Co.; of St. John's spruce and sawn pitch-pine by David Roberts, Son & Co., Ltd.; of St. John's spruce deals and scantling by C. Noel, Leigh & Co.; of white oak boards and medium walnut boards by James Kendall & Co.; and of whitewood boards, ebony,

lignum vitæ, hickory, &c., by Irvine & Sellars.

Mahogany.—The year opened with a much larger stock of African mahogany in hand at Liverpool than at the beginning of 1905, the stock of rin., stated in feet, being 999,000ft. At the beginning of 1903 the stock was only 295,000ft., but by the close of that year it had increased to 980,000ft. The year 1905 opened with 620,000ft. in hand, so that the present year began with a stock of African wood more than one-third greater than that held at the beginning of 1905. Next in quantity came Cuban wood, of which the stock amounted to 279,000ft. This is much the largest stock held at the beginning of any of the last four years, the stock at the beginning of last year being only 4,000ft. At the beginning of 1904 the stock was 134,000ft. The large stock of Cuban wood in hand on January 1st was due to the smaller consumption of this wood last year, and to the heavy importation in 1903-4. Of Mexican, Tobasco, Panama, Columbian and Nicaraguan woods the stocks on January 1st were light, totalling 62,000ft., which, however, was in excess of the stock held a year ago, when the total was but 25,000ft. Of St. Domingo wood a moderate stock of 4,000ft. was held at the beginning of the present year.

On January 25th Messrs. Alfred Dobell & Co. offered the large quantity of 931 logs of Lagos wood, of which 823, representing 587,052ft., were sold at prices ranging from 2½d. to 6d. and yielding an average price of 3½d. This wood was of good character and of useful sizes. A large number of African lots were sold, the prices per ft. super. ranging from 2d. to 1s. 6d. At their sale on the next day African sorts were again preponderant and brought prices ranging from 2½d. to 11d. per ft. super. The averages of the African lots ranged from 2½d. to 6½d. Some very fine St. Domingo wood was sold, among 550 logs of the class the record price of 2s. 5d. being paid for the choicest; four logs of Cuban were readily sold at 5½d. per ft. super.

The results of these first sales gave promise of active and satisfactory business in mahogany for the first quarter of the year.

Walnut.—The consumption of American walnut last year as nearly as possible equalled the quantity imported, but with the quantity brought forward from 1904 there remained a stock of 6,000 cub. ft. with which to begin the present year, this being 1,000ft. in excess of the quantity on hand at the beginning of 1905. The consumption of Italian and Circassian wood last year exceeded the importation, and the year closed practically without any stocks of these woods in hand. Cape Lopez wood, which was offered by auction on January 25th, brought from 2d. to 2½d. per ft. super. Furniture wood, offered as such at the same sale, brought 2d. per ft. super.

Teak.—The year opened with a stock in hand of 47,500 cub. ft. of wood, in logs and planks. A feature of last year's business in this wood was the coming forward of the large quantity of about 98,000 cub. ft. from Java, a new field of supply. Teak has sold more freely of late owing to the easier prices at which the wood has been obtainable. The increased interest shown in the wood has proved that more business may be done in it at prices which buyers regard as satisfactory.

Timber Trade Benevolent Society,

This society has found many warm supporters among members of the Liverpool timber trade, whose assistance has been afforded in different ways. The third annual concert in aid of the society was given in the Carlton Hall, Liverpool, on January 20th, and was well attended. Major William Taylor, treasurer of the Liverpool branch, presided. Mr. Alfred Dobell, president of the branch; Mr. J. Griffin, vice-president; Mr. John H.

Ashton, president of the Manchester branch; Mr. W. Oughtred, vice-president; and Mr. J. W. Burton, London, were among the company present. The local subscription list was stated to amount to £230.

Trade and Craft.

For Cutting Iron Gutters.

We call to mind, as an instance of the conservatism of British manufacturers, a recent case where an exceedingly novel tool for cutting boilers was introduced by an American agent; but although the traditional method of cutting with a file and a hammer and chisel is so laborious and slow, this particular agent experienced the greatest difficulty in getting makers to adopt, or even to consider, his patent tool. Instances of a similar kind might be repeated without number, for, as a nation, we are singularly tenacious of established methods, and singularly slow to adopt innovations. Maybe Messrs. Charles Winn & Co., of St. Thomas's Works, Granville Street, Birmingham, have experienced this in regard to the patent cutter for cast-iron gutters which they have introduced. Yet this tool should be of the greatest service to builders and others. From the accompanying illustration it will be seen to consist primarily of a hollow box-saddle, a cutter, and a handle

THE GRANVILLE GUTTER CUTTER.

for operating the cutter. The saddle is capable of taking the largest size gutter, and lose half-round packing pieces are supplied for dealing with the smaller sizes. The cutter is circular and is reversible to four different cutting positions, thereby being equal to four separate cutters. A spring is provided in the sleeve which carries the cutter to allow the latter to ride or lift over the hard places which are frequently found in cast-iron gutters. To operate the machine the gutter is laid in the half-round pads or rests, and fixed in position by means of two cams on the one side and by a strap with wing nut on the other side. The cutter is then fed down to its work by the star wheel in the handle until sufficient cut is put on, and then by working the handle backwards and forwards the gutter is cut through, the tool operating both on the forward and the backward movement. With this machine (the cost of which is 70s.) gutters can be cut square and clean without breakage, and not only is time saved by its use, but odd or broken pieces of gutter can thus be cut and sold instead of being scrapped.

THE TITLE PAGE

AND

INDEX FOR VOL. XXII.

(July to December, 1905)

OF

THE BUILDERS' JOURNAL

can be obtained free, upon application to the Publisher, 6, Great New Street, Fetter Lane, E.C., enclosing 1d. stamp to cover postage of same.

Competitions Open.

UNIVERSITY COLLEGE OF NORTH WALES, BANGOR.

The Council will shortly invite a limited number of Architects to submit COMPETITIVE DESIGNS for the Permanent Buildings of the College. Architects who desire their names to be considered by the Council in selecting their list may send particulars of work already designed or executed by them to the undersigned (from whom further particulars may be obtained) before MARCH 1st next.

JOHN EDWARD LLOYD, M.A.,
Bangor, Secretary and Registrar.
January 24th, 1906.

Contracts Open.

HERTFORDSHIRE COUNTY COUNCIL.

GARDEN FIELDS COUNTY COUNCIL SCHOOL, ST. ALBANS.

The Education Committee are prepared to receive TENDERS for the carrying out of ADDITIONS and ALTERATIONS to the Garden Fields County Council School, St. Albans.

Persons desirous of tendering for the work may see the Drawings, Specification, Agreement, &c., at the County Surveyor's Office, Hatfield, on and after Monday, February 5th, 1906, between the hours of 10 a.m. and 4 p.m., except on Saturday, when they will be on view from 10 a.m. to 12 noon.

A copy of the Schedule of Works and Prices (Quantities), and a Form of Tender, can be obtained at the County Surveyor's Office upon payment of Two Guineas, which sum will be returned to the tenderer upon receipt of a bonâ fide tender and the documents which have been supplied to him.

Sealed tenders, endorsed "Tender for alterations and additions to Garden Fields C.C. School, St. Albans," must be delivered to the undersigned at his Offices not later than 5 p.m. on MONDAY, February 19th, 1906.

Such security for the due execution of the works as the Council may require must be given by the Contractor. The lowest or any tender will not necessarily be accepted.

URBAN A. SMITH,
County Surveyor.

County Surveyor's Office, Hatfield,
26th January, 1906.

CHELTENHAM EDUCATION COMMITTEE.

TO BUILDERS.

Tenders are invited for the ERECTION of new SCHOOL BUILDINGS, to accommodate 1,100 children, for the Naunton Park District of Cheltenham, in accordance with Plans, Specifications, and Conditions of Contract, to be seen at the Offices of Messrs. CHATTERS and SMITHSON, Architects, 17, Regent St., Cheltenham.

Early application is requested for bills of quantities, which will be supplied by the Architects upon receipt of a deposit of £2 2s., to be returned upon receiving a bonâ fide Tender.

Tenders, sealed and endorsed, must be delivered to the undersigned by TWELVE o'clock, on THURSDAY, the 22nd FEBRUARY next.

No pledge is given by the Committee to accept the lowest or any tender.

WILLIAM PRESTON,
Education Offices, Secretary.
Rodney Road, Cheltenham.

price 7s. 6d. net.

ARCHITECTURAL SKETCHING AND DRAWINGS IN PERSPECTIVE.

With 36 Plates, illustrating the drawing of Architectural Details and Sketching to Scale; including chapters on the Plan and Measuring Point Methods, the Simplification of Perspective, and on Figures, Foliage, &c.

By H. W. ROBERTS, Architect,
Author of "R.'s Method of Perspective."

This book provides a progressive course of perspective drawing, founded to some extent upon the now well-known "R.'s Method," showing its application to various problems of practical work. Its aim is to present perspective in a simple form, and to aid the draughtsman by placing at his disposal various practical expedients to simplify the details of his work.

6th edition, Revised, and largely re-written.
Crown 8vo, cloth, gilt, price 6s. 6d.

QUANTITIES, 7th edition, price 7s. 6d.

B. T. BATSFORD, Publisher,
94, High Holborn, LONDON.

If you have anything to sell

or if you want to buy anything, if you require a situation, or if you have a berth vacant, the best medium for advertising your want is THE BUILDERS' JOURNAL. Advertisers in our Miscellaneous Columns obtain most satisfactory results, and we frequently receive letters stating that an advertisement in the Journal brings immediate replies.

"A first rate medium for Situations wanted. I have received several answers to my advertisement," writes an advertiser who obtained a situation after inserting an advertisement in our columns. This is only a sample of what we are constantly hearing. Write your advertisement clearly and send it to the Manager, Builders' Journal, Great New St., Fetter Lane, E.C.

It will bring you results.

The Ghost. A FRENCH sculptor, M. Paul Nocquet, who won the Prix de Rome in 1900, has been agitating recently against the employment of "ghosts" by sculptors. It must seem rather strange to us that sculptors should employ ghosts, but of course in France sculpture is much more largely used than it is here. M. Nocquet states that many sculptors are not the authors of the works they are commissioned to do, although they sign their own names to them, and he desires "to determine clearly who among those that claim the appellation of sculptors are real and sincere artists, and who are merely business men." This reminds us of the fact that the architectural profession also possesses its ghosts to a much greater

extent than the sculptor's profession. There are undoubtedly many draughtsmen in architects' offices who carry out the entire work for which the business man receives the credit. A few of these business architects could not make a creditable drawing to save their lives, nor understand the construction of the buildings ascribed to them. The only saving clause is that architects do not sign their buildings here, and the majority of such office-manufactured works are not of merit enough to leave any posthumous credit to the head of the office that designs them. For those few draughtsmen who are of great ability and undertake the work with the utmost sincerity we have sympathy, and we condemn the system which does not allow their names even to appear as part-creators of the work. But there is another side to the question, which we think ought to be considered by draughtsmen who are only too ready to relieve their chief of any share in the work, and that because he does not put pencil to paper for every detail for which they are responsible. The fact is architectural design has become much more complicated, and architects of large buildings are now required to possess business ability and power of organization not generally characteristic of men of artistic temperament. On a large job it is impossible for any man to carry out in the short time at his disposal all the detail drawings, or even thoroughly to supervise them. He must leave a good deal to the draughtsmen, who, after all, do little more than the masons of the Gothic age. If the architect can go so far as to prepare the $\frac{1}{8}$ -scale drawings he is in a fortunate position, but we would not deprive anyone of the title of architect who did not even put his pencil to paper throughout the designing of a building. The case of Mr. Richardson, the great American architect, is one in point. He suffered from continual ill-health, and on that account often only made rough sketches of the mass and general lay-out of a plan. This he talked over and gave to his chief draughtsman, who came to his bedroom and then went away to carry out the idea as best he could, bringing it back to his chief for criticism. Richardson often kept him busy for hours rubbing out before he was satisfied. He also had other draughtsmen and an outside superintendent or superior clerk of works, but the fact that Richardson was the architect and not his assistants was clearly shown after his death, because not a single member of his office (which split up) ever executed a building that had any suggestion of being strong or of the same character as that done in Richardson's lifetime, although they copied his style as nearly as possible because it happened to be the fashion. Of course we may go so far as to say that the work of Richardson was really the product of a school, but we think he was rather more than the nominal head: that it was his

critical ability and power of impressing upon his assistants his ideas and methods that were responsible for the remarkably fine work he turned out. There are architects to-day whose methods are very similar. They may employ draughtsmen whose hand can be seen in their work, but it is tempered and refined by their presiding genius. Architects now require a large staff of draughtsmen and many assistants, and the architect himself needs to have considerable business tact and the power of organization and supervision of the details. He need not be such a master of every special branch of construction as the particular assistants to whom he relegates these branches, nor need he be as fine a draughtsman as many of those he employs, but his all-round abilities in planning and organization must be recognized as superior to any one of his assistants, many of whom could not secure and undertake such large jobs even if they had the opportunity. The practice followed in the States in the case of firms of architects who have large works in hand is, however, worthy of adoption in this country, namely, to associate the names of the chief men responsible. Some of these offices of associated architects have three names—the first being that of the dominant business partner, who deals with the clients, secures the work and generally receives all instructions and organizes the office; the second name that of the more artistic partner, who is responsible for the design in consultation with the business architect; while the third is the one who attends to the carrying-out of the work and the engineering side.

Competition Design by Proxy. ATTENTION was called to another variety of the employment of ghosts at the last annual convention of the American Institute of Architects, when the committee on competitions presented a report in which they reprehended a practice "which becomes more and more popular in some cities." This practice appears to be that of "employing skilled men only for and during competitions for the special purpose of designing and preparing plans to win." The committee assert that they have heard—they do not say "known"—of instances "where competition experts were employed to take charge of the office, evolve the plan, make the design and superintend the preparation of all drawings, while the architect knew little of what was going on"! This sort of thing is not altogether unknown in this country, but there does not seem to be any means of putting a stop to it other than the remedy in the hands of the draughtsmen themselves; for if they have the ability to win competitions for their employers, they have it also for themselves. If they fail when standing alone, then it must be recognized that the assistance they receive from their employers is more than monetary.

TITE PRIZE DESIGN: DETAIL.

their baths as ordinary buildings with the roof removed. Viewed from outside they might be casinos, town halls or any other public buildings.

"Fiat Lux" sends end elevations which are absolutely ecclesiastic in character, though his treatment of the bath with an open colonnade to the garden is quite excellent. It is a pity he did not develop this suggestion further. "Pleiades" has an ambitious but hardly completed design with many good points, not the least of which is that he has aimed high: "Bo'sun" has a good idea in the terrace roofing to his colonnade, but his detail is poor, and the

intercolumniations unpleasant, the voids being too square in form. "Hodden-Gray" sends a design well drawn but hardly student-like enough in detail. The masonry of the parapets is too heavy, and the central entrance very unsatisfactory as regards the panel over the arch.

"Cui Bono" has a vigorously-drawn set showing a really fine sense of massing. The interior is, however, rather "thin" in design and hardly carries on the solidity of the exterior. The author has destroyed the scale of his perspective by filling in the circular openings with black, which forces them into undue prominence and is fatal to all

suggestion of aerial perspective. I mention this design for its merits, but it is clearly disqualified as not complying with the conditions of the competition. "Seed," "1905," and "Aqua," with a Palladian design of merit, all deserve mention. "Aristobulus" fails in the treatment of his internal angles and rounded seats. "Ajax" shows some good composition in his section, but the whole design is slovenly in execution. "E pluribus unum," "Michelange" and "Ultra" show some promise; but the first fails, in scale, the second is lacking in imaginative quality, and the flat domes, of the third require more apparent solid support.

Views and Reviews.

Model Villages.

We consider Bournville to be the most successful of the garden villages which have been promoted. Port Sunlight had several firms of architects engaged on it, and although variety is all very well in its way there seems to be no general coherence in the scheme there carried out. At Bournville, however, the general direction of affairs has been in the hands of Mr. W. Alexander Harvey, who while achieving considerable variety in design has retained the same general feeling in his work, which is most able. Almost all his designs deserve praise. This book illustrates the different varieties of plan and elevation which he has designed, both by means of scale plans and elevations, perspectives, sketches and photographs. It forms a most useful collection of data derived from practice and not from theory, while Mr. Harvey has imparted much interest to the volume by chapters of a general character in which he puts forward his own ideals. A very good feature is the statement of cost in each particular case. This, however, shows us that Bournville has no more than any other garden village really solved the problem of the cheap cottage. Its cottages are for the superior artisan rather than the agricultural labourer. There is no cottage at Bournville which has cost less than £150. The cheapest seems to be about £200 and upwards. There is, it is true, a block of cottages illustrated in this book estimated to cost £135 each when built in blocks of eight, but of course everyone has had experience of estimates, and we could wish for the actual figures. The fact that the Village Trust cannot build more than blocks of four cottages prevented this from being carried out, and we learn that blocks of four on this plan are estimated to cost £160. We think, however, this ought to be lessened because the plan is a very economical one, consisting of living-room, scullery, w.c., and larder on the ground floor, with three bedrooms on the first floor, all in a square block. The planning of all the cottages at Bournville is on the whole economical, but we think there has in some cases been a waste in the direction of the provision of needless buttresses, complication of roofs, and other features by which the architect has endeavoured to give interest. The effect is not always happy because we instinctively feel the futility of so increasing the cost where simplicity is pleasing enough. We have already published some of the photographs which appear in this volume. We now illustrate a cottage built in 1903 at a cost of £540, which comes out at 6½d. per ft. cube. The cottage is built of white-washed common bricks with a tarred plinth, the roof being tiled.

"The Model Village and its Cottages: Bournville," by W. Alexander Harvey. London: B. T. Batsford, price 8s. 6d. nett.

Laxton's Price Book.

We welcome the 1906 edition of this recognized aid-book. The prices in the book for this year have been thoroughly revised, and it needs no recommendation on our part. We would only impress upon the building trade that such reference books as this are too often neglected and one edition kept in the office for several years, whereas it should be up-to-date, and it ought to be made a rule to possess the latest editions of all text-books in every office. The cost is so very small considering the assistance they give, the saving in time alone being a great consideration, that it is foolish to neglect such an obvious business matter. In this edition the amendment to the London Building Act for 1905 has been included in full.

"Laxton's Price Book." London: Simpkin, Marshall, Hamilton, Kent & Co., Ltd., price 4s.

HOUSE AT BOURNVILLE, BIRMINGHAM.

W. ALEXANDER HARVEY, ARCHITECT.

Law Cases.

Extension of Time: The Architect's Position.—The case of *Ellis v. Gundry* came before the Devon Assizes, Second Court, recently. Counsel for the defendant, Col. Gundry, of The Grange, near Honiton, said the claim arose upon a building contract and upon the architects' certificate. Col. Gundry employed the plaintiffs, Messrs. Ellis & Sons, of North-tawton, to build certain stables for him. The contract was dated March 4th, 1904. The question of law to be determined was whether or not the parties were, in the circumstances, bound by the certificate of the architects fixing the time in which the contract, plus extras, had to be finished, so as to give right of deduction after that date. The time fixed for the contract works to be completed was September 8th, 1904, and the works at the time were not finished. Col. Gundry wrote to Messrs. Ellis, Bowden & Ellis, architects, of Exeter, asking what was a reasonable time for the completion of the contract. They replied giving the date as December 24th, 1904. The defendant claimed penalty of £10 a week for fifteen weeks, the work not having been completed until the spring of the following year.

Counsel for the plaintiffs submitted that the architects' certificate as to time of completion not having been given before the contract was completed, did not come within the meaning of clause 25 of the contract. The judge said the only question was as to the construction of clauses 23, 24 and 25. He construed these to mean that if in the opinion of the architects the works in question were delayed by reason of authorized extras or additions the architects must make a fair and reasonable extension of time for the completion of such works. That was all set out in the plainest possible way in clause 25. The question was when it had to be done. For the plaintiffs it had been contended that it must be done before the completion of the work, and that unless it was done before that time it did not come within the meaning of clause 25. His lordship disagreed. If that were the case an architect must extend the time whenever extras and additions were ordered at the time they were ordered, which was absurd. The architect was not bound to give the certificate before the completion of the work. His lordship held that in this case the argument of the defendant must prevail, and judgment would be given in his favour.

Corporation's Refusal of Plans: Important Case.—In the King's Bench Division of the High Court of Justice last week Mr. Dean, builder of Middlesbrough, moved for a rule nisi for a mandamus calling on the Middlesbrough Corporation to show cause why they refused to approve certain plans deposited with them in connection with the proposed erection of fifteen houses on the west side of Lothian Road, Middlesbrough. The Corporation had refused the plans on two occasions, but would give no reason for their action, although it was pointed out to them that the by-laws had all been complied with.—The Lord Chief Justice gave it as his opinion that the rule ought not to be granted. The affidavit stated that the plans had been twice refused, and that they were in accordance with the by-laws. But, in order to grant a rule for a mandamus, there must be something to show that the local authority were not acting properly in the matter, and had refused the plans on some ground which was not within their discretion. That had not been shown, and therefore the rule could not be granted. If the applicant could amend his application and bring forward anything to show that the Corporation had not exercised a proper discretion, or any discretion at all, the court would consider whether a rule ought to be granted. But at present the materials submitted in this case were wholly insufficient.—Mr. Justice Ridley concurred, and the rule was accordingly refused.

Competitions.

Acton Municipal Buildings.

We regret that in our remarks last week under the heading of "The Acton Municipal Buildings Farce," the figures were inadvertently given as £10,000 and £60,000. The sentence should have read: "The lowest tender for works which were expected to cost some £60,000 has come out at close upon £100,000."

Carnegie Library Competition, Crompton, Shaw, near Oldham.

The assessor in this competition has made his award as follows:—1st premium (£30), Mr. Jesse Horsfall, F.R.I.B.A., 4, Chapel Walks, Manchester; 2nd premium (£20), Mr. A. E. Dixon, A.R.I.B.A., and Mr. Charles H. Potter, 65, King Street, Manchester; 3rd premium (£15), Mr. Thomas J. Hill, 55, Cross Street, Manchester; 4th premium (£10), Messrs. John Eaton, Sons & Cantrell, Stamford Street, Ashton-under-Lyne. There were forty-six designs submitted. The award was unanimously approved by the Free Library Committee, and on the assessor's recommendation it was decided to give an additional fourth premium (£30, £20, £15 and £10 instead of £30, £20 and £10 as originally intended) as above. The designs are on public exhibition this week at the Crompton Town Hall from 2 p.m. to 8 p.m., except on Saturday, when they can be seen from 10 a.m. to 12 a.m. and from 2 p.m. to 6 p.m.

GREENWICH LIBRARY COMPETITION.

THE 172 designs submitted in the competition for a branch library to be erected in London Street, Greenwich, are on exhibition this week in the Greenwich Public Library. We publish on the next page the first-premiated design, by Messrs. Wills & Anderson, of London, and by giving a detailed description of this design the character and conditions of the whole competition will be set out for all. Messrs. Wills & Anderson state:—

It is evident that the exceptional nature of the site, hemmed in as it is between adjoining properties, precludes the usual arrangement adopted in similar buildings, *i.e.*, a centrally-placed lending department immediately opposite a central entrance with a news-room to one side and a reference library to the other. Nevertheless, in so small a building it is desirable to avoid corridors, which are expensive and difficult to supervise. In the arrangement adopted the three departments are placed in the usual order, but in consequence of the narrowness of the site they are arranged one behind the other, the news-room and lending library occupying the whole width of the site, and the reference-room made sufficiently narrow to allow the book-binding room and workroom to be arranged at the side of it. Corridors are thus avoided, sufficient space being allowed for passage-way in the newsroom, while giving the full superficial area demanded for news-stands and magazine-tables. In the lending department the borrowers' space also forms a passage-way to the reference library, which would not be found an inconvenience bearing in mind the small number of readers who would at any time be using the reference library. It has been considered that although a central entrance lends itself to a more architectural treatment than a side entrance, such an arrangement unnecessarily complicates the plan, and such a sacrifice of simplicity is not worth the advantages gained. On the opposite side, balancing the entrance, is the entrance leading up to committee-room and down to heating chamber and caretaker's store. This stairway is accessible either externally by a separate entrance or internally from the newsroom.

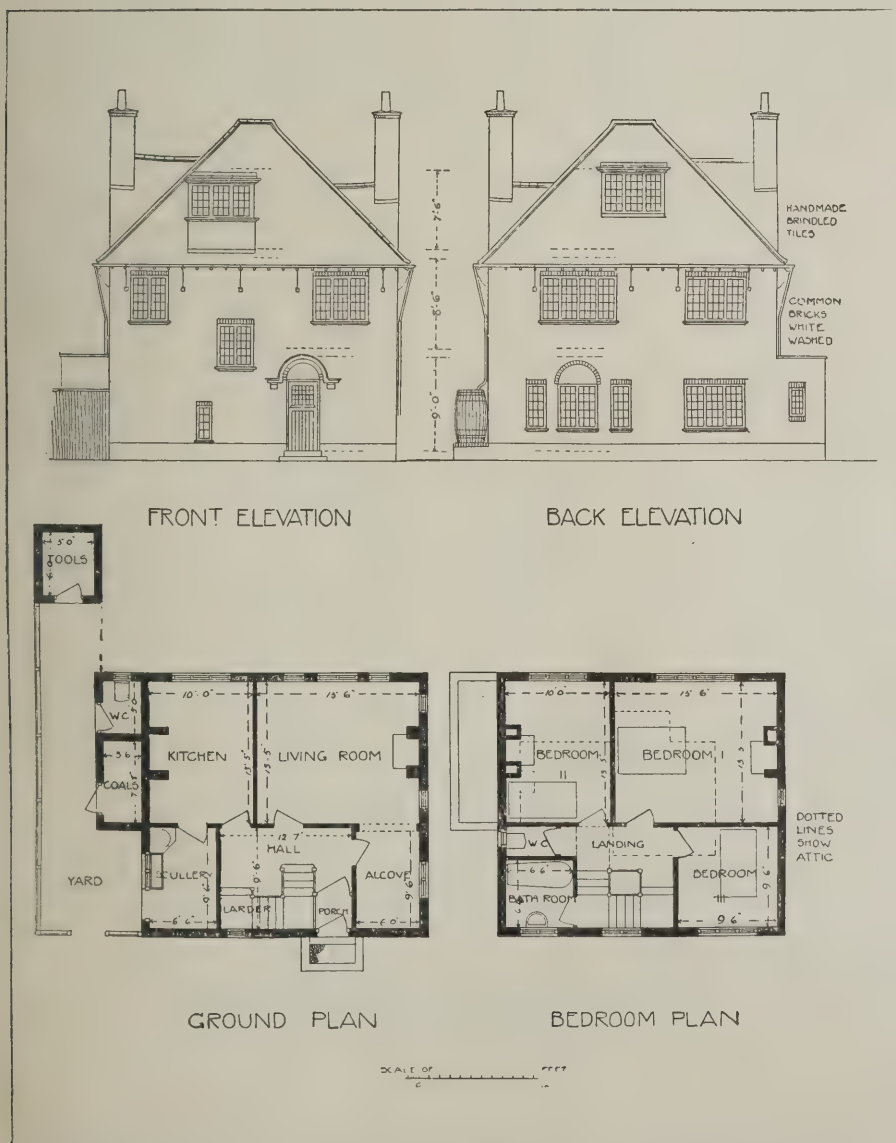

The internal treatment is exceedingly simple, each of the two main rooms forming a square hall lighted from shallow central domes supported on four columns. The reference library is treated in a similar manner.

The front is proposed to be faced with red bricks and Portland stone dressings; floors of pine blocks laid in asphalt on cement; pitched roof slated, and flats of steel and coke-breeze concrete asphalted; domes of steel covered with 6 lbs. lead; joinery of deal painted, with oak doors on the front elevation; windows glazed with lead lights in iron frames; heating by low-pressure hot-water ventilating radiators.

The building contains 110,449 cub. ft., which at 9d. a foot cube amounts to £4,142, or with architects' and quantity surveyors' fees to the stipulated amount of £4,500, this sum including gas and heating arrangements: fittings would probably cost another £250.

The design placed second, by Mr. Henry Goldsmith and Mr. G. Hartley Goldsmith, of Manchester, has the newsroom in the front, with the lending library behind, and the reference library and staff room at the back of the site, a passage-way being arranged from the main entrance to the lending library, running along beside the newsroom into a large hall facing the lending library and abutting on the reference library. The design placed third, by Mr. H. A. Crouch, of London, W.C., follows very much the same arrangement, though the hall in this design is not so large.

The premiums in the competition were £25, £15 and £10 respectively. Mr. A. W. S. Cross, F.R.I.B.A., was the assessor.

LYTHAM GRAMMAR SCHOOL COMPETITION.

AMONG competitions recently decided undoubtedly the most important has been that for the proposed secondary grammar school to be erected near Lytham, a town on the Lancashire coast built on the long line of sand dunes which extend in an almost unbroken series from the estuary of the Dee to Fleetwood.

The town is one of those possessing a large endowment vested in governors, who recently decided to devote a very large amount for the erection of a grammar school and to obtain designs by a competition limited to thirteen architects resident in Liverpool, Hull, Manchester, Lancaster, Lytham and other towns.

The importance of the competition may be gauged from the initial outlay—£22,000 for land and £30,000 for the first instalment of buildings. Additions are intended to be made later, and they had to be provided for in the designs.

Competitors had an excellent site giving them an entirely free hand in the grouping of their buildings—a large square plot bounded by roads on all sides, facing the sea, just outside the town, with an area of more than thirty acres, a frontage of 1,293 ft. and a depth of 1,267 ft. The conditions stated that it was the intention of the governors to accept the award of the assessor and to entrust the carrying-out of the work to the author of the design placed first—a most important paragraph, which ought to be included in all competition instructions.

The successful competitors were Messrs. Briggs & Wolstenholme, of Blackburn, to whom the first premium of £250 was awarded by the assessor, Prof. Beresford Pite, of London.

The Requirements.

Before describing the designs submitted, a brief reference to the requirements will be necessary to enable readers to grasp the main features of the scheme. A group of buildings was required for day scholars, boarders' and headmaster's residence; staff, including masters, matron, servants; science and lecture rooms; a large hall to seat 700 to 800 persons; workrooms for wood, metal, &c.; a large dining hall with kitchen, and a number of other rooms—all grouped to comply with complicated conditions and arranged round a quadrangle after the style of our old colleges.

The instructions stated "that the site is subject to storms of wind and sand of great violence, and that designs must be studied to withstand them." The residential portion of the buildings was, therefore, placed on the east side of the quadrangle by all the competitors, as this is the most sheltered. On the west side many of them placed the science room, and on the north or south sides the classrooms and the large hall.

In many designs one side of the quadrangle was left open, shut in with a low screen wall and large entrance gates and piers, the entrances being placed inside the quadrangle.

No fewer than ten pages of instructions and schedules were sent to competitors, who had an extremely tough task in attempting to comply with them. They had to work out six essential points before the details of the plans could be elaborated, namely, the position of the great hall, the grouping of the classrooms, and the positions of the dining hall, of the headmaster's house, of the boarding school, and of the science rooms and workrooms.

It may be stated generally that the conditions laid down by the Board of Education were complied with, except that in one case the classrooms had right-hand instead of left-hand lighting, without any apparent reason for what is obviously an error.

The Design Placed First

has fairly won the place of honour. A lofty tower, which will become a noted landmark, forms the centre of the elevation facing the main road, and a bold archway on the ground-level is the main entrance to a large quadrangle, on four sides of which the college buildings are grouped. Facing the tower on the opposite side of the court is the main school entrance, with cloak-rooms right and left, leading to a large hall (with top light) and the main stairs, all planned on the centre line of the building. Branching right and left is the corridor extending completely round the quadrangle, giving easy access to all the rooms. Continuing along the centre line is the hall, extending outwards from the south front of the building, with a corridor on each side leading to the doors and the platform. Along the south front, opening out of the corridor, are the classrooms, mainly with south light, and all on the ground floor, as suggested by the conditions. At the west end of the quadrangle is the archway to the playing fields, also an isolated w.c. block, whilst along the west corridor are the changing room, drying room, spray baths, lavatories and gymnasium. The east side is set apart for the residential rooms; at one corner is the headmaster's house, with a separate entrance and access to the corridors. Adjoining is the school kitchen and its offices, placed round a square court to serve both the master's house and the dining hall, and at the extreme south end are the rooms for the boarders. The buildings on each side of the tower are intended for future erection; it is unfortunate that they cannot be erected at once so as to complete the scheme. It would probably be more economical to do so whilst the contractor has his plant and staff on the ground. The elevations are designed in Renaissance, cleverly treated; and as the plan shows prominent projections and wings formed by the larger rooms, a very attractive group of buildings is shown on the elevations, cleverly elaborated on the sheet of details.

Second-premiated Design.

The second premium of £100 was awarded to Hull architects, Messrs. Broderick, Lowther & Walker. They arranged their buildings in three blocks placed at right angles so as to enclose three sides of a large courtyard open to the sea. The classrooms were grouped around the great hall, without corridors, most of them facing south and forming the north side of the court. The headmaster's house, dining hall, the boarders' dayrooms and dormitories formed the east side, so as to obtain as great a protection as possible from the prevailing westerly winds and storms. The science rooms, gymnasium and subsidiary rooms were on the west side, totally different from the plan placed first. These three blocks were connected to each other by short covered ways with arched openings. The principal entrance to the school from the main road was provided with a well-designed porter's lodge. The classrooms for future addition were placed on the first floor over those below. Several competitors adopted the same idea, though it may be urged that it leaves the main portion of the building in an incomplete state for a term of years. The problem of future additions to both classrooms and science rooms has given competitors a good deal of trouble; its solution has been tried from almost every point of view. The proper way would be to design the future additions as separate wings. One competitor has done so to a limited extent, but not to the whole design.

Third-premiated Design.

The third premium went to Messrs. Potts, Son & Hennings for a cleverly-thought-out design, the only flaw in it being that the classroom corridor had rooms on both sides with borrowed light. The working-out of

the extensions problem is the essential feature of this set. The classrooms face south and form the sea-frontage of the quadrangle, those for future requirement being placed over them on the first floor; the whole of this block it was suggested should be erected at once and completed. These upper rooms were to be used as temporary science rooms, until the science block was erected completing the quadrangle; that would prevent the erection of an incomplete classroom block and an incomplete science block, both of which would be eyesores for many years. This proposal evidently attracted the attention of the assessor, and the third premium is probably due to it. This was one of the designs with a complete quadrangle, the buildings being grouped as follows:—Classrooms and large hall on the south side, the hall forming the main architectural feature of the quadrangle; the master's residence, dining hall, kitchen offices and boarders' rooms on the east side; the science and art rooms and museum on the north side; and the cloak and changing rooms, gymnasium on the west. Towards the main road two large arched entrances were shown into the courtyard, with a central entrance into the science block. Towards the sea-front there was a central entrance into the classroom block and large hall. The conditions stated that the headmaster's house should be isolated and that his study should be in direct touch with the classrooms was worked out by placing it at the corner of the quadrangle with a door into the classroom corridor. The elevations were effectively designed in the late Tudor period, which has been so frequently used for buildings of this class. They would probably have looked well if they could have been carried out.

Fourth-premiated Design.

Several competitors must have stood a good chance of securing the fourth premium. Messrs. T. Muirhead, Mangnall & Littlewoods, Haywood & Harrison, and G. H. Willoughby sent carefully-thought-out designs. The fourth premium was awarded to Mr. Willoughby. All these designs were worked out from different points of view and all had their good points. Some preferred to enclose the quadrangle with buildings and others to leave one side open, to enable views of the interior to be obtained. Mr. Willoughby treated the position of the headmaster's house in relation to the school buildings with great skill. Messrs. Mangnall & Littlewoods placed the whole of the classrooms on the ground floor with a central corridor, with top light; both those to be erected at once and those for future extension. There can be no doubt that this is a good idea, but it involves the use of north light for many of them. The conditions stated: "The classrooms should as far as possible face south; it is preferable that they should be on the ground floor." Messrs. Mangnall & Littlewoods' scheme was a successful compromise.

Mr. Muirhead placed his classrooms in two parallel rows, both facing south; those to be erected later were to be placed over them on the first floor.

Messrs. Haywood & Harrison's large hall and dining-hall were well placed in relation to other parts of the buildings. The elevations of all were of the collegiate type, and evidently the work of experienced draughtsmen.

Designs were also submitted by Messrs. H. & W. Wade, Austin & Paley, Barry & Son, Medland Taylor, J. D. Harker, and J. Gorst & Son; all have good points, but space will not permit special reference to them.

The Strand Station of the Piccadilly and Brompton Railway will have its entrance on the Strand and its exits in Surrey Street, where there will be a forecourt.

THE TIMBER TRADE.

London Market in January.

PRICES for wood in the London market rose during January, dragged up by increasing quotations elsewhere. The dock deliveries, Messrs. Churchill & Sim state, were less even than in January, 1905, but the open weather both here and in the north of Europe enabled an increased business of more than 2,000 standards to be effected overseas. This is the only sign of any improvement in the local demand, and prospects ahead for importers are therefore most difficult. With their trade practically as bad as ever, they are faced with a greatly increased cost for everything they want, which has been established by conditions which do not apply to their own market; and after a series of years of unsatisfactory trade the long looked-for improvement has come in a shape which, although increasing the value of the small stocks stored here, holds out little hope of profits on further purchases. The financial breakdown which occurred during the month rather points the situation. Both from Sweden and Russia the business of the month for fresh shipments in the coming season was on a large scale and at gradually augmenting prices. Buyers have been found chiefly in the various Continental centres, and to some extent also in Scotland and the north of England. Stock notes have been generally denuded of all saleable dimensions and qualities, and large quantities of the less appreciated sizes have been carried off with them. There is a residuum of deals, especially from the White Sea, where the starting quotations erred a little on the side of dearth; but even for these there has been no sign of any relaxation from the full prices asked.

Messrs. Denny, Mott & Dickson, Ltd., observe that January started so hopefully that some disappointment has been caused by an absence of any very appreciable briskness in the demand. "Business has, however, been steady and well sustained, although merchants and dealers have not seen eye to eye with shippers in respect to forward business. The improvement in the demand has been real, but as usual overrated by the shippers, who want to make up for bad times. When the views of shippers and merchants have reached 'the happy mean' a good all-round trade should be done, as it is reasonable to expect that even the disorganized building-trade industry cannot lag so far behind the general improvement in trade, as it still appears to be doing. Housebuilding, both as a necessity for an increasing population as well as a favourite means of investment for savings with the well-to-do working class and small trader, must have a place in the general improvement in business."

The abstract of dock stock, consumption, &c., for January, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stock.

The stock of wood in the public docks on January 31st was:—

Foreign deals and ends -	-	-	Pieces.
Do. battens -	-	-	1,418,000
Do. battens -	-	-	2,445,000

Pine deals and battens -	-	-	Pieces.
Spruce do. do. -	-	-	873,000
Boards, rough -	-	-	764,000
Do. prepared -	-	-	3,845,000
Do. prepared -	-	-	6,941,000
Totalling 16,286,000 pieces, as against			
19,666,000 in 1905, 23,125,000 in 1904, and			
20,321,000 in 1903.			
In other kinds the stock was as follows:—			
Foreign wainscot logs -	-	-	159 pieces.
Do. oak timber -	-	-	342 loads.
Do. fir timber -	-	-	2,150 do.
Do. Oregon pine, &c., spars	-	-	and masts
Colonial oak timber -	-	-	5,377 do.
Do. birch timber and planks -	-	-	1,429 do.
Do. elm and ash timber -	-	-	4,204 do.
Do. yellow pine -	-	-	878 do.
Do. red pine -	-	-	350 do.
United States pitch-pine timber	-	-	64 do.
Do. do. deals -	-	-	14,083 do.
East India teak -	-	-	28,000 pieces.
	-	-	6,470 loads.

The deliveries for January

have been of—

Foreign deals and ends -	-	-	Pieces.
Do. battens -	-	-	283,000
Pine deals and battens -	-	-	428,000
Spruce do. do. -	-	-	71,000
Boards, rough -	-	-	83,000
Do. prepared -	-	-	444,000
	-	-	1,103,000

Totalling 2,412,000 pieces, as compared with 2,576,000 in 1905, 2,774,000 in 1904, and 3,316,000 in 1903.

Deliveries from Ship to Craft.

The deliveries direct from ship to craft for January were:—

	P.s.h.	1905.	1904.	1903.
Deals and battens	3,232	1,634	2,632	1,930
Boards -	874	394	402	679
Total	4,106	2,028	3,034	2,609

Soft Woods.

Swedish Deals and Battens.—There was not much change in the London market for Swedish stocks during January. The increased rates established in December were fully maintained, but the demand was poor, and the small stocks of deals and battens were bought up because they were cheaper than anything that could be imported rather than for consumption. Flooring boards have improved freely in price, the demand being more active, the stock small, and forward prices prohibitive. Shippers are expecting to add the full cost of preparing on to the high rates at which their battens can be easily sold, which is not unreasonable, but there are no equivalent prices in the London market yet, and there has probably seldom been a January in which so little business for arrival has been negotiated to London.

Norwegian Boards.—Prepared boards rose freely in price during January, and the local demand was fairly satisfactory. A large business was done by Norwegian shippers with this country in boards for shipment in the coming season at good prices, which, however, have been under those which could be accepted by the Swedish millowners. Norwegian stocks seem now to be fairly cleared for the present.

Russian Deals and Battens.—In London prices for Russian deals and battens have remained nearly stationary at the best of the rates established before Christmas. For arrival, White Sea shippers have made large progress with their open-water stocks at high rates, depending mainly on the specification sold. Considerable quantities of deals have been carried off at full prices with the more saleable dimensions, and the prospects of the

available stock being absorbed during the season without any break in quotations are brighter now than they were a month ago.

Finnish Battens.—The London market for Finnish battens was quietly firm in January. Shippers made further very considerable sales forward to this country and the Continent during the month.

Prussian Timber.—The demand for fir timber was comparatively lively during January, and prices improved. Oak also improved again in price. There was not much demand, but supplies this year promise to be scanty and costly.

Canadian Timber.—The pine deal market in London has shown more life than for some time past, and, stimulated by the position in Canada, prices here have advanced. For spruce deals also the market is better, scepticism as to the solidity of present quotations from the other side being rather on the wane. More business has therefore been possible, buyers yielding to a very slight easing in quotations for shipment. Prices for all the Canadian hardwoods and for yellow-pine timber are also rather on the increase in the London market.

Hardwoods.

Teak.—Messrs. Denny, Mott & Dickson, Ltd., state that the landings in the docks in London during January consisted of 1,186 loads of logs and 569 loads of planks and scantlings, or a total of 1,755 loads as against 356 loads for the corresponding month of last year. The deliveries into consumption were 1,456 loads of logs and 313 loads of planks and scantlings—together 1,769 loads, as against 1,255 loads for January, 1905. Figures show that, notwithstanding the restriction in consumption attendant upon unprecedentedly high prices, the demand has been fully up to the total imports of all descriptions of teak. It is also to be noted that one-third of the abnormally small total stock of logs and planks consists of Java wood, which description—although forcing its way into consumption—is, quite apart from the question of weight and quality, very much handicapped by want of length in the logs, so that the better-liked Rangoon, Moulmein and Bangkok stocks of 4,321 loads all told are dangerously inadequate to the demand; and the stocks on the shipbuilding rivers are also very bare. The position, therefore, promises neither relief from high prices nor from nervousness as to an inevitable shrinkage in the volume of the turnover unless shippers can increase the rate of supplies, which they insist cannot be done except by shipping second-class wood, which is an expedient tending to discredit the merchant here with the buyer and also to lower the high character of teak.

Messrs. C. Leary & Co. report that business in teak during the month was characterized by a quiet tone, sufficient to arrest the upward course of prices without, however, entailing any decline in values.

Mahogany.

In mahogany three public auctions took place during the last half of the month, competition being good and prices firm. Stocks of most descriptions are small, and with a prospect of light imports the outlook is distinctly favourable.

ABSTRACT OF STOCK, CONSUMPTION, &c., IN LONDON DOCKS, FOR JANUARY.

S.C. Dks. and M. Dks.	Deals (Fir).	Battens (Fir).	Pine.	Spruce.	Pitch-pine Deals.	Deals and Battens in Aggregate.	Rough Boards (All Countries).	Flooring.	Floated Timber.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication. Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Stresses in Suspended Chain.
HARROGATE.—QUEX writes: "The points of support of a uniformly loaded hanging chain are 50ft. and 70ft. above the lowest point in the chain, and the horizontal distance between the points of support is 300ft. The load is 3 tons per foot-run horizontal. Please state the pull in the chain at the points of support and at the lowest point. I desire to know the method of calculating only the focal length on a bridge due to moving load and dead load. Do not trouble in regard to the graphic method."
The load being taken at 3 tons per foot-run horizontally, the chain will hang in two semi-parabolas instead of being catenary as would be produced by the weight of a

uniform chain only. Fig. 1 shows a sketch of the arrangement. Tension at lowest point c of chain = $wl^2 = \frac{w(2x)^2}{8d_1} = \frac{w(2y)^2}{8d_2}$
 $= \frac{wx^2}{2d_1} = \frac{wy^2}{2d_2}$. Therefore $\frac{x^2}{d_1} = \frac{y^2}{d_2}$ and $\frac{x^2}{y^2} = \frac{d_1}{d_2}$
 $= \frac{50}{70} = \frac{5}{7}$, whence $\frac{x}{y} = \frac{2'236}{2'646}$. Therefore
 $x = \frac{2'236}{2'236 + 2'646} \times 300 = 137'4$ ft., and
 $y = \frac{2'646}{2'236 + 2'646} \times 300 = 162'6$ ft., making
the total of 300ft. Take tension = $\frac{wx^2}{2d_1}$
 $= \frac{3 \times 137'4^2}{2 \times 50} = 566'37$ tons, or
 $\frac{wy^2}{2d_2} = \frac{3 \times 162'6^2}{2 \times 70} = 566'54$ tons,

mean, say 566'5 tons. The tension at support A (Fig. 2) is composed of two forces, viz., 566'5 horizontal and 412'2 vertical. Resultant = $\sqrt{(566'5)^2 + (412'2)^2} = \sqrt{490831'09} = 700'6$ tons. The tension at support B (Fig. 3) will in the same manner be Resultant = $\sqrt{(566'5)^2 + (487'8)^2} = 747'5$ tons. The "focal length on a bridge" is a new term in bridge design which the writer has not heard before, and he is therefore unable to say how it can be calculated. HENRY ADAMS.

Moment of Resistance of Trough Section.
LONDON.—W. L. J. writes: "How is the moment of resistance determined for deck flooring shown by accompanying sketch? Also, what safe distributed load would it bear, the span being 7ft. 6ins.?"
The moment of resistance (R) of the section shown in Fig. 1 is equal to the moment of inertia (I) divided by the distance (y) from the neutral axis to the furthest edge of the section in inches, and multiplied by the intensity of stress (c) allowed in tons per square inch. The inertia area may be found as shown in Figs. 2, 3 and 4, and described in Molesworth's Pocket Book, p. 129, from which the moment of inertia (I) = inertia (a) \times area of section (A), or $9'2 \times 15 = 138$. Then $R = \frac{I}{y} c = \frac{138}{4} \times 6'5 = 224$ ton-inches. Now the moment of resistance (R) is equal to the maximum bending moment (M), and the maximum bending moment for a distributed load is $\frac{WL}{8}$, where w = total load in tons and L = span in inches. Then $M = R$, $\frac{WL}{8} = R$, $WL = 8R$, whence $w = \frac{8R}{L}$. Substituting the figures obtained, $w = \frac{8 \times 224}{7'5 \times 12} =$ say, 20 tons total distributed load over a span of 7ft. 6ins. HENRY ADAMS.

Overhanging Wall.
LONDON.—E. S. writes: "Kindly advise me about a wall which divides the garden of my house from next door. I wish to know who it belongs to. It overhangs my garden about 6ins., and looks as if it might fall down any moment."
The information you give is insufficient, in itself, to enable a true opinion to be formed as to the ownership of the wall in question. Are there not some T marks in the boundary lines upon the plan on your lease? If so, the wall belongs to the side upon which those marks are shown. How is the wall constructed? If it has strengthening piers or "counterforts" in various places the wall probably belongs to the side upon which those thickening piers occur, as it is presumed that the owner originally built it with a straight face towards his neighbour's land and upon the extreme boundary of his

own property; and any projections therefore would be built upon his own land. F.S.I.]

Distribution of Load on Girder.
HARROW.—STUDENT writes: "A rolled steel girder over a 20ft. span carries a brick pier which is distributed over the central roft. of girder. Should this be calculated as a load concentrated in the centre or as one distributed over the entire length of girder?"
The brick pier—or brick wall as it should be called—must be taken as a distributed load over the portion occupied. Assuming the wall to weigh 5 tons, as Fig. 1 (below), the bending moment diagram will be as Fig. 2 and the shear stress diagram as Fig. 3. A suitable section would be Dorman, Long & Co.'s* Groa roin. by 5in. by 29 lb. rolled steel joist, or their G 7a 12in. by 5in. by 32 lb. rolled steel joist. In Fig. 2 the height of the triangle is $\frac{WL}{4} = \frac{5 \times 20}{4} = 25$ tons-feet. Joining the two points of the sides of the triangle immediately below the ends of the load, a parabola should be constructed upon the line with the height of $\frac{WZ}{8} = \frac{5 \times 10}{8} = 6'25$ tons-feet. The base of the parabola being 12'5 tons-feet below the base of the triangle, the total maximum bending moment will be $12'5 + 6'25 = 18'75$ tons-feet. Then $18'75 \times 8 = 150$, the tabular number to seek for in the catalogue. For the shear stress diagram (Fig. 3) the stress at each end equals the reaction = $\frac{5}{2} = 2'5$ tons, and continues uniform until the edge of the load is reached, when a line joining the two extremities as shown will give ordinates for the stress throughout the beam. HENRY ADAMS.

DISTRIBUTION OF LOAD ON GIRDER.

Locality of Roof Truss.

NORTHWICH.—M. K. E. writes: "If existent, where can I see the roof described and illustrated on p. 37 of your issue for January 17th?"

The writer is unable to say where the roof truss referred to is erected, or even whether it exists, and in the face of the dispute disclosed in the question the locality could not be stated, even if known.

HENRY ADAMS.

A Party-wall Question.

WESTERLY GALES writes: "A is the owner of certain houses, one of which adjoins vacant building sites owned by B. One of the conditions of the land company from whom the sites were purchased by both parties provides as follows—that 'all division walls and division railings are to be party-walls and railings, and if already made, the taker of the adjoining lot must pay to the person by whom they were erected one-half the cost incurred in such erection.' Now A has erected dwelling-houses upon his sites in accordance with the plans of the estate architect, and B has paid A the half value of the division walls, &c., built by A for their joint benefit: but it is not the intention of B to commence building on his sites for some years. In the meantime A's house is rendered very damp and practically untenable through the rain which penetrates this party-wall (of brick and of the thickness, &c., as approved by by-laws and estate architect). What is B's liability and A's remedy? Can B be legally compelled to make his own half of the party-wall impervious to the rain, or, in other words, can A require B to take such measures as are necessary to prevent A's property being damaged by wet entering through B's half of the party-wall?"

Both parties appear to have fulfilled their legal responsibilities in this matter, and there would appear to be no liability upon B compelling him to build within a certain period) the land company's rules would show whether this is the case or not). At common law there is certainly no such liability upon B, and I can only advise that A should come to an arrangement with him by which A may at his own expense render the face of the party-wall waterproof. F. S. I.

Obituary.

Mr. James Brown, builder, of Newport, Dundee, died last week, aged about 80.

Mr. W. A. F. Powell, head of the well-known glass firm, died at Clifton last week in his ninety-third year. He attended to his business until within a week of his death.

The late **Mr. F. W. Wentworth-Shields, M.I.C.E.**, of Southampton, resident engineer of the Crystal Palace during its construction and largely associated with the design of the Victoria Embankment and with the foundation of the Albert Memorial, left estate of the gross value of £2,382.

Mr. Coates Murgatroyd, a well-known builder and contractor, of Bradford, died last Wednesday after a brief illness. His firm, Messrs. Coates Murgatroyd & Son—the latter being Mr. Arthur J. Murgatroyd, who is a member of the Bradford City Council—carried out many important railway and Government contracts.

The late **Mr. Ingleby Wood**, architect, of Edinburgh, whose death at the early age of thirty-three was chronicled in our issue for last week, acted as honorary secretary for the exhibition of architectural refinements held last autumn under the auspices of the Edinburgh Architectural Association, and to his administrative ability and untiring energy the success of the exhibition was due.

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:—

Retention for a further period of the temporary iron chimneyshaft at the electricity generating-station, Millbank Street, Westminster, on the application of C. S. Peach. (*Consent.*)

Deviation from the plans approved on 30th August, 1905, for the erection of a building for the United Universities Club, Suffolk Street and Pall Mall East, so far as relates to the substitution of two smaller balconies for one large balcony at the first-floor level on the Pall Mall East frontage (the projecting portion of the front being also kept back to the main front of the building), and an alteration in the projection and length of the two balconies at the first-floor level on the Suffolk Street frontage, on application of R. Blomfield, A.R.A. (*Consent.*)

Retention of a projecting clock in front of No. 118, West End Lane, Hampstead, on the application of R. Cornish. (*Consent.*)

Bay windows above the one-storey shops in front of Nos. 23, 24, 25, 26 and 27, Crofton Park Terrace, Brockley Road, on the application of Tomkins & Connew. (*Consent.*)

Iron and glass conservatory at the first-floor level at the rear of "Keith House," Bayswater Road, Paddington, on the application of L. H. Isaacs, on behalf of Sir Clifton Robinson. (*Consent.*)

Retention of a wooden signboard in front of No. 47, King Street, Hammersmith, on the application of F. T. Harris, on behalf of H. Samuel. (*Refusal.*)

Iron and glass shelter in front of No. 26, Vaughan Road, Camberwell, on the application of G. G. Rogers, on behalf of F. J. Wescott. (*Refusal.*)

Buildings on the site of No. 247, Lower Road, Deptford, on the further application of J. H. Bethell, on behalf of H. Bellsham. (*Refusal.*)

Building on the site of Nos. 75 and 76, Lombard Street, City, with external walls at less than the prescribed distance from the centre of the roadway of such street, on the application of M. E. Collins, on behalf of Slazenger & Son. (*Consent.*)

Retention of wooden enclosures at the rear of No. 34, Newington Green, Hackney, abutting upon Church Path, on the application of R. Manley. (*Refusal.*)

Buildings on the west side of Vestry Road, Camberwell, on the application of E. Crosse & Co., on behalf of G. Pedley. (*Consent.*)

Modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of a two-storey stable building on a site at the rear of warehouses on the south-east side of Barron's Place, Southwark, on the application of A. E. Chasemore, on behalf of W. Sumption. (*Consent.*)

New street for carriage traffic to lead from Lower Kennington Lane to Denny Street, Lambeth, on the application of C. Barker, on behalf of the Duchy of Cornwall. (*Consent.*)

Two oriel windows in front of Nos. 59 and 60, Pall Mall, on the application of E. Guy Dawber, on behalf of the London and Lancashire Fire Insurance Co. (*Consent.*)

Retention of a wood and iron motor-house at the rear of No. 219, New King's Road, Fulham, abutting on Coniger Road, on the application of Dr. F. J. Ayre. (*Consent.*)

Deviation from the plan approved on 18th July, 1905, for the erection of a building with a one-storey portion in front upon the site of No. 73, Highgate Road, St. Pancras, so far as relates to the construction of two skylight windows over the one-storey portion next the wall of the main building, and to the erection of an iron and glass covered way over the front portion of the cartway entrance to the premises, on the application of S. P. Rees. (*Consent.*)

Building on a site abutting upon Prah Road and St. Thomas Road, Finsbury Park, on the further application of F. Matcham & Co. (*Refusal.*)

Dwelling-house and a one-storey shop on the west side of Harvey Road, Camberwell, southward of No. 6, on the application of W. Smith. (*Refusal.*)

Building at the rear of No. 243, Uxbridge Road, Hammersmith, to abut upon Askew Crescent, on the application of Prickett & Ellis, on behalf of Miss Axton. (*Refusal.*)

Modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of buildings on the southern side of Camberwell New Road, next Denmark Hill, with irregular spaces at the rear, on the application of R. L. Pearce, on behalf of A. A. Carter. (*Consent.*)

One-storey shop adjoining No. 118, Manor Road, Brockley, abutting upon Brockley Road and Manor Road, on the application of J. Webster, on behalf of P. Verschooten. (*Consent.*)

Iron and glass porch in front of No. 13, Maresfield Gardens, Finchley Road, Hampstead, on the application of H. Carpenter, on behalf of S. Baer. (*Consent.*)

Retention of a building to be used as a watch-box on the eastern side of Wood Lane, Hammersmith, on the application of W. Weaver, on behalf of the Council of the Royal Borough of Kensington. (*Consent.*)

Oriel window and balconies in front of a proposed extension of the Berkeley Hotel, Berkeley Street, Piccadilly, on the application of R. Griggs, on behalf of the Berkeley Hotel Co., Ltd. (*Consent.*)

One-storey shop in front and at the flank of No. 14, Brownhill Road, Catford, on the application of A. W. Osborn, on behalf of B. Walker. (*Consent.*)

Addition to a building at the rear of No. 1, Mitre Terrace, Mitcham Road, Tooting, to abut upon Vant Road, on the application of E. Bates, on behalf of Welfords' Surrey Dairies, Ltd. (*Consent.*)

Alteration to a porch in front of No. 87, Victoria Street, Westminster, on the application of Griffin & Woollard, on behalf of J. B. Martin and others. (*Consent.*)

Deviation from the plan approved on 21st October, 1902, for the formation or laying-out of a new street to lead from Morning Lane to Chatham Place, Hackney, so far as relates to an alteration in the position of the boundaries of such street, on the application of Hodson & Whitehead. (*Consent.*)

Erection at Messrs. Peek, Frean & Co.'s biscuit works, Drummond Road, Keeton's Road, and Storks Road, Bermondsey, of additions to Blocks B, C, L, M, N and N¹, whereby such blocks will exceed in extent 250,000 cub. ft., on the application of Stock, Page & Stock, on behalf of Peek, Frean & Co., Ltd. (*Refusal.*)

Deviations from the plans certified by the district surveyor so far as relates to the proposed erection of a building on the site of Nos. 240 and 241, High Holborn, on the application of H. T. C. Newton-Mason. (*Consent.*)

Five dwelling-houses to be inhabited by persons of the working class, to be erected on a site at the rear of dwellings in Picton Street, Camberwell, on the application of J. A. J. Woodward & Sons, on behalf of J. Dennis. (*Consent.*)

New street for carriage traffic to lead from Perry Hill to Castland Road, Lewisham, on the application of E. E. Leach. (*Consent.*)

Deviation from the plans sanctioned on 25th July, 1905, for the formation or laying-out of new streets for carriage traffic out of the western side of Thrale Road and northern side of Nimrod Road, so far as it relates to the omission of the footpath on the northern side of the road adjoining Tooting Graveney Common, on the application of D. Young & Co., on behalf of A. W. Gosden and H. F. Crunden. (*Consent.*)

New streets for carriage traffic out of the south side of Hazlewell Road and in continuation westward of Chartfield Avenue, Putney, on the application of J. C. Radford, on behalf of Lord Westbury. (*Consent.*)

Retention of wooden fences or barriers across Biddulph Road and Ashworth Road, on the Paddington Estate, Sutherland Avenue, Paddington, on the application of A. T. Stewart. (*Consent.*)

Retention of barriers across the Delaware Road on the Paddington Estate, Sutherland Avenue, Paddington. (*Refusal.*)

Retention of barriers across Ellerton Road, Wandsworth, on the application of Holloway Brothers. (*Consent.*)

Deviation from the plans approved on 19th December, 1904, for the formation or laying-out of streets for foot traffic only on a site on the west side of Backchurch Lane and east side of Gower's Walk, Whitechapel so far as relates to an alteration in the position of buildings on the western side of Backchurch Lane, on the application of Crickmay & Heath. (*Consent.*)

The Theatres and Music Halls Committee also reported the following:—

Plans submitted by F. Matcham & Co. showing the alterations proposed to be carried out at the Holborn Empire (late Royal Music Hall), Holborn, in order to give effect to the suggestions made by the Council for the structural improvement of the premises. In the execution of the work certain deviations have been made from these plans, and amended plans have now been submitted by Matcham & Co. showing the alterations which have been carried out. Matcham & Co. have also submitted plans showing the office accommodation in connection with the premises. (*Consent.*)

Plan submitted by F. Matcham & Co. showing a proposed rearrangement of the coal-bunker in connection with the boiler-house at the London Coliseum. (*Consent.*)

Plans submitted by Bull & Bull showing the proposed arrangement of the seating for the Naval and Military Tournament which it is intended to hold at Olympia, and also the seating arrangements in the Olympia annexe in connection with its use as a variety theatre. (*Consent.*)

THE PURPLE PATCH.

THE "third spasm" of "The Tufton Street Tatler or The Purple Patch," wherein the wits of the Architectural Association disport themselves—and they do so with much gusto—is now upon us. We recommend it as an excellent sixpenny tonic to all dejected assistants and comfortable practitioners. Here are a few of the latest quips and fancies:—

The forthcoming Architectural Congress is beginning to loom large on the horizon, and already preparations are being made for what, as far as we can make out, will be an enlarged and glorified Spring Visit. But if we may judge the state of the profession abroad by its present condition in England, we would advise intending hosts not to make too elaborate arrangements, as it seems only too likely that many of our visitors will have the greatest difficulty in satisfying the Immigration Officers under the new Act that they possess means of subsistence.

A possible addition to the specification: "Attend upon the engineer, and finish him in the best manner, and do everything to render the work perfect and complete."

From a village churchyard: "Here lies an architect who designed his own tombstone, for which the contract sum was less than his estimate."

That in view of the condition of some of the cottages in the Wilderness City, it is now to be re-named "Shoreham."

That one of the most recent building combines is to be re-named the "Britannia Metal Building Co.," on account of its wearing white all through.

Patcho for the hair. N.B.—Insist on seeing the libel.

THE ARCHITECTURAL ASSOCIATION.

THE VAULT-BUILDERS.

A MEETING of the Architectural Association was held on Friday evening at 18, Tufton Street, Westminster, the chair being occupied by the president, Mr. E. Guy Dawber, F.R.I.B.A.

The following new members were elected:—Messrs. E. Dickens, D. W. Rowntree, H. R. Levy, P. M. Stratton, W. F. Edge, G. Robb, G. Dovaston, R. S. B. Wyld, G. S. H. Bradford, R. S. Petch, J. G. Alder, B. J. Boothroyd, C. P. Wade, G. E. Fitzgerald, F. E. Harris and E. Petre.

The following further donations to the Building Fund were announced:—

	£	s.	d.
Charles Morrison	-	50	0 0
Ernest George & Yeates (2nd donation)	10	10	0
Leslie W. Green do.	-	3	3 0
H. L. Anderson do.	-	2	2 0
A. Durst (double subscription)	-	1	1 0
Maurice E. Webb do.	-	1	1 0
A. Crow do.	-	0	10 6
C. W. Ferrier do.	-	0	10 6
W. Curtis Green do.	-	0	10 6
F. T. W. Millar do.	-	0	10 6
John Murray do.	-	0	10 6

It was decided to send a vote of condolence to the widow and family of the late Mr. John P. Seddon, one of the oldest members of the Association, who joined in 1847. He was honorary secretary to the Association in 1850-51, and also honorary secretary of the Royal Architectural Museum for a time with Mr. Maurice B. Adams.

The president announced that it was proposed to call a special general meeting for February 23rd, with reference to rules 21 and 31, the proposal being to reduce the ordinary members of council by one and to make the editor of the Association "Journal" a member of council.

The Rev. G. H. West, D.D., A.R.I.B.A., then read a paper on "A Comparison between the Mediæval Architecture of England and France." At the outset he explained

The Outstanding Difference between English and French Cathedrals.

The French cathedral, he said, was the material expression of a newborn national life, rising from the very midst of the crowded dwellings, a great assembly hall open to all from end to end, with generally a comparatively small choir and no solid screen between clergy and people; whereas the English cathedral, the expression of monastic life, generally stood apart from the city to which it belonged, nestled amidst the elms of its quiet close, side by side with the chapter-house where the monks transacted their business during life and the peaceful cloister where they slept at last—two buildings hardly ever found now in connection with a French cathedral; for though so-called cloisters did exist in some cases in France, yet they were the dwellings of the secular clergy of the church, and very early became a tangled mass of tortuous streets surrounded by a wall, not a cloister in the usual sense.

Such contrasted views as those of Chartres and Lichfield, Wells and Rouen, summed up completely the stories of the two national churches, and anyone who could remember Rouen as it used to be, with the old houses built against its walls, would be able to realize how completely the French cathedral was the centre of the life of the city.

There could be no more telling contrast than the view of Rouen, with the fortified palace of the archbishop adjoining the cathedral, in the very centre of the town, and that of Exeter from the quiet bishop's garden, with the large-windowed Elizabethan house. It would also be found that, whereas the great lay guilds built the French cathedrals and handed down as craft secrets their learning and traditions, so that the constructional development of French Gothic was the result of the severest logical reason-

ing from first to last, the English cathedrals were frequently built under the direction of the monks, if not actually with their own hands, as at Gloucester, and there was consequently a comparative absence of scientific tradition, much less coherence in purpose and expression, but more individuality and local originality.

Let us now turn to the constructional development.

The Problem.

From the time when Christian art began to revive after the fall of the Roman empire the efforts of all builders in the ancient imperial provinces of Western Europe had been centred in the attempt to do with small materials and a limited supply of unskilled labour what the Romans themselves had never even attempted with building resources such as the world had never seen before or since—to cover the three-aisled basilica, which by long use had become the recognized form for the Christian church, with the stone or concrete vault of the great halls of the Roman baths. The intersecting vault could be managed over the small square compartments of the aisles, but was quite beyond the power of these early builders for the high vault of the nave, while the continuous thrust of a barrel-vault, unless the three aisles were kept of equal height, as at Champdeniers, brought all to ruin before long.

Its Solution.

By the beginning of the twelfth century it had become obvious that if the problem was to be solved some means must be found for concentrating the thrust upon certain points, preferably upon the corners of a square, either, as at Perigueux, by a series of domes on pendentives, or, as at Vezelay, by the regular Roman intersecting vault. This was the form which ultimately prevailed, for it was a fairly obvious step to work from centerings placed under the angles of the intersecting cylinders, and to get over the difficulty, insurmountable to these early builders, of getting the proper ellipse given by the intersection of two semicircular vaults in one of three ways—either by making the intersecting centerings semicircular and then building a dome around them, as in Aquitaine; or by piling earth on the top till the vaults themselves also became nearly semicircular, though still domical, as at Vezelay; or, as at Durham, by making the centerings segmental.

Stone Centerings.

It was at Durham, in England, and a little later at St. Denis, in France, that the great step was made which gave birth to Gothic of making these centerings of stone and leaving them as a permanent support to the vaulting panels, and letting each panel be separately supported by the centerings or ribs.

In this lay the key to the history of all later mediæval architecture. After St. Denis all French churches existed by and for the vault, the plan of which was in the mind of the builder from the moment when the first stone was laid. It took some time for it to be found out how great the thrust was even of this form of vault, but that abutments were needed only at the springers. This abutment was given at first in the simplest way, as at Durham, by a complete arch over the triforium carrying its roof, and later by a quarter arch butting against the springing, as at Gloucester and the Abbaye aux Hommes at Caen. But it was soon found that these arches should abut higher, and when the triforium became a mere passage they were left outside the roofs and became continually more complex, passing from the simple forms of Chartres to the extremely elaborate and beautiful ones of Amiens and St. Ouen.

Exposed Construction.

The principle once admitted of allowing all the constructional parts of a building to

be exposed to the weather, nothing could be more perfectly thought out than the French cathedral, where the walls had formed "four deep" and the thrust of the great vault was carried down to the main buttress by an arch. All the intermediate spaces were mere screens of storeyed glass, and nothing could be more perfect in its beauty. But, as always in human work, only for a moment did these stern reasoners and perfect artists rest on the summit, and Beauvais was a literal example of that "vaulting ambition which o'erleaps itself."

Effect on the Interior.

Such was the extreme expression of French thirteenth-century Gothic; but while the vault thus dictated the exterior forms of the building, it affected the interior hardly less. The monocylindrical columns, with great voluted capitals derived from Classic times, were soon felt to be unsuitable, as so much of their upper surface was left unused and the arrangement was illogical. So in the later columns of Notre-Dame the pier arches had their own column, with a capital of one course, and the main vaulting shaft was the continuation of another column rising from the ground, and having its capital at the vault, and the original main column, with a capital of two courses, appeared behind these.

We thus had

The Principle of Continuity

distinctly formulated—that every arch must have its own column, that every column must have its base on the ground and its capital at the springing of its arch. Soon it was felt that every colonette should have members corresponding to the mouldings of its arch, and so by a gradual transition, which might be well traced at N. D. de l'Épine and St. Ouen, it came to be felt that the capitals had lost their meaning, and that all mouldings of all arches should run down to a common base without a break, sometimes dying into one another on the way, as at St. Maclou, but reappearing below, even if their reappearance was marked only by the corners of their imaginary bases supposed to exist inside that of the main pier, but to have been turned round so that their corners projected from the facer. Though ugly and wearisome in its latest examples, the better specimens of this last French style were many of them singularly beautiful, as St. Wulfram, at Abbeville, and the smaller details of these churches were often exquisite, like the organ staircase of St. Maclou and its wonderful porch.

The English Development.

Turning now to English architecture. First to be noticed was the tendency to bold square projections and the square east end, both of which might safely be attributed to the persistence of Saxon traditions. For a time this Saxon tradition was obscured by the Lombardic or Basilican plan, with three parallel apses or a single one, used by the Normans in Italy. English tradition, however, soon reasserted itself, and was finally fixed by the great influx of Cistercians in the twelfth century, whose churches invariably had square east ends. One other peculiarity of the English plan, the great length of the nave, was probably due to the narthex of Cluny, the influence of whose plan was to be noted at Lincoln, being taken into the church. We had only one instance—Ely—of its persisting in its original form; the Galilee of Durham being hardly a case in point.

How the Hammer-Beam Roof arose.

There was also this to remember. When the Normans came to England they had already learned to build in stone probably from their Italian masters, but their predecessors, the Scandinavian invaders of the eastern counties, were, like the ancient Greeks, essentially a shipbuilding race, accustomed to the use of large timbers and of planking on

curved surfaces. In the eastern counties, therefore, we find in several cases, as at York and Ely, stone vaulting imitated in wood, and an original development (to which there is nothing corresponding in France) in very elaborate open timber roofs made of large timbers. While in the French roof the tie-beam was a mere light tie often suspended from the main trusses by braces, as at St. Ouen, these shipbuilders used a heavy tie-beam carrying the king-post, and, when it sagged, took to bringing forward the sole-piece into the church and connecting it by long curved struts like ship ribs with the rest of the roof, and so developed the hammer-beam roof.

A new System.

But the real glory of English art was to be found in its latest form, due to the way in which the English mason, when left to himself and deprived during the Hundred Years' War of all French influence and help, reasserted his own originality and worked out a completely new system of vaulting, which gave to our Perpendicular a stately life and vigour almost lacking in late French Flamboyant.

The English Mason.

The early French builders could hardly get rid of the idea that each vaulting bay ought to be a separate entity, by preference a square, and at least domical.

To the Englishman, accustomed to curved planking on his ships, it seemed much simpler to treat the courses of his vaults like planks of the same width all along, and by dividing the half rib and half arch into an unequal number of equal parts, instead of, like the Frenchman, into an equal number of unequal ones, he got not a straight joint, but a dovetail along the ridge, and his vaulting panel ceased to be curved and self-supporting and became flat and weak. So an intermediate rib, or lierne, was inserted to strengthen this, and then others, till after passing through the stage of Lincoln we reached such a beautiful form as Exeter. But a difficulty arose with these liernes. They varied greatly in length, according to their position, and were all much shorter than the diagonals. Either, therefore, the ridge could not be kept level, or the curves of the shorter ribs must be "judged," as at Minster. Where the curve changed a short cross rib, or tierceron, was put, and a star of lozenge pattern obtained with the ribs, as in Worcester cloister and at Christchurch.

Then bosses were put where the ribs intersected, as at Lincoln and Canterbury, and all sorts of fanciful arrangements of the ribs indulged in, till the practical result was a ribbed wagon vault with intersections, as in Winchester nave and Gloucester choir, while from the number of ribs of similar curve springing from one capital and meeting a flat ceiling arose the fan vaulting of the cloister, where the curves were simple. Then from changing the curves to make them meet a level ridge where there was no flat ceiling arose

The Four-centred Arch.

the form usually adopted in fan-vaulting, and which naturally, as the pointed arch had done previously, descended through the wall arch and window head into all the rest of the building.

Having thus got the idea of this cone of spreading ribs, it was ingenious to bring it out from the wall and spring it from a pendant as centre, as at Christchurch and Oxford Cathedral, or even to bring it out so far as to quite complete the cone and let it meet another half cone springing from the wall, as in the Divinity School, Oxford, and that final masterpiece of Henry VII.'s Chapel, so easy to criticize, so impossible not to admire.

The important point to notice was that in these latest vaults the true function of the multiplied ribs had entirely disappeared, and

they and the intermediate parts were all cut out of large blocks of stone. We had thus returned to the Roman wagon vault, with its continuous thrust—a strange result to follow from a slight alteration of the arrangement of the stones in the vaulting panels, and yet inevitable from rigidly following artistic reasoning. It was rendered all the more striking by the fact that the French, who strictly adhered to their original system, never arrived at these rich vaults. Here and there, as at Caudebec, we found a pendant taking the place of a central column, but it was a *tour de force*, and in late French vaults, as at Abbeville, pendant bosses were quite common and lierne vaults, as at St. Riquier, not uncommon; but when we met with anything like elaboration, as at Rue, it was a piece of fanciful decoration, not a natural artistic development.

Mr. W. H. Seth-Smith, proposing a vote of thanks, recalled the fact that Dr. West had been trained as an architect both in England and France. He felt it was impossible to criticize the paper, which was of the greatest importance because there was a strong tendency to-day to set aside Gothic work in favour of Classic.

Mr. Hugh Stannus, in seconding, said he had never heard the differences between the two great styles of French and English Gothic so admirably put as by Dr. West.

The president also spoke.

The lecture was illustrated by a large number of lantern slides of absorbing interest.

Correspondence.

Over-pupilled Architects' Offices and Assistants taking Private Work.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In the excellent paper on "Difficulties of Practice" published in your issue for January 24th, Mr. J. Archibald Lucas, F.S.I., A.R.I.B.A., touches the question of over-pupilled offices and suggests that no architect should be allowed to take more than two pupils at one time. Would that such a practice were carried out. What assistant has not been nearly heartbroken to see his drawings, upon which he has lavished so much care, hopelessly disfigured in tracing by pupils doing the work of paid assistants, to say nothing of the wearisome task of correcting and making good the multitudinous commissions before the tracing can be sent out.

As to assistants taking private work, surely nothing could be more unjust than Mr. Lucas's contention. Take the case of an assistant who has to depend entirely upon himself for a livelihood (not one who can state in his advertisement "salary a minor consideration") and who has not the opportunities or connection necessary to start a practice. Think of the hard-earned money spent on an expensive education, and with what result? A prospect of a miserable suburban villa existence on £3 10s. a week—and none too certain at that. Surely he will not be grudging the paltry guinea or so earned in his spare time by an occasional tracing or a design for a "villa residence" for the builder round the corner, who would never go to the expense of employing an architect. If so, then may I give warning to any would-be aspirant to the hallowed ranks of the architectural profession, whose sole capital is his brain: rather let him be content with a Board school education and a berth as a commission traveller in somebody's patent "Allalite" wall-covering. His prospects will be a thousand times better, and he will be entirely free from the hundred-and-one cares of

AN ARCHITECT'S ASSISTANT.

LEYTONSTONE.

Notes and News.

The President of the American Institute of Architects this year is Mr. Frank Miles Day, and the first vice-president Mr. Cass Gilbert.

District Surveyors' Association.—Mr. Edward Dru Drury has been elected president of this Association for 1906 and Mr. Frederick Wallen vice-president.

Llandaff Diocesan Architect.—The post of diocesan architect for Llandaff has become vacant by the death of Mr. John P. Seddon, and a successor is now being advertised for.

A new School at Bargoed was opened recently. It is built of Pennant stone, with Forest of Dean and brick dressings. It accommodates 350 children. The cost of the work was £6,200. Mr. John Lewis, Caerphilly, was the builder, and the architects were Messrs. Morgan & James, F.R.I.B.A., of Cardiff.

A Rowton House at Newcastle-on-Tyne has been built at the top of Dog Bank and Lower Pilgrim Street. The building is of three storeys, containing 254 cubicles. Mr. J. C. Maxwell, A.R.I.B.A., of Newcastle, was the architect and Mr. S. F. Davidson the contractor, who carried out his work in fourteen months.

A new Church at Harrogate is being erected at a cost of £24,000 (exclusive of tower and spire) from designs by Mr. Temple Moore. The length will be 187ft., nave 104ft., width of nave and aisles 54ft., length of transepts 112ft., length of choir 80ft., and width 56ft. Tadcaster stone is to be used for the building. Mr. T. Rawling, of York, is the contractor.

The extension of the Plymouth Borough Asylum at Blackadon, which has been carried out at a cost of about £30,000, is now completed. By the addition of new male and female wings and another storey built over a portion of the old premises the accommodation for patients has been doubled to 400. There only remains the re-decoration of the old building below the new storey, tenders for which are to be invited forthwith.

An Exhibition of Municipal Cottages.—The directors of First Garden City are considering the question of holding an exhibition of municipal cottages on the Garden City estate (Letchworth, Herts) during the summer of 1907. It is hoped to have the cottages erected during the coming year, so that the buildings will be complete and the gardens laid out before the exhibition is opened.

At the Church of St. John Bowling, Bradford, thirteen coats-of-arms have been inserted in the east widow by Messrs. Burlison & Grylls, of London (who supplied twelve), and by Messrs. Kayle & Co., of Leeds (who supplied one). New clergy and choir vestries have also been erected, and the reredos completed as a memorial. The various works have been carried out from the designs and under the supervision of Mr. J. Drake, M.I.C.W.A.

Cardiff Town Hall and Law Courts nearing Completion.—The huge new town hall and law courts in Cathays Park, Cardiff, are expected to be finished by next autumn. So far as the building work is concerned, Messrs. Turner & Sons have practically completed their contract. The heating and ventilating apparatus has been in operation for some time, and the electric-light wiring has been done, though the fittings have not yet been fixed, neither has the telephone system been installed. In the law block the assize court has been panelled to a height of about 20ft. by Mr. John P. White, of Bedford, who is also executing other fine woodwork. The architects of the buildings are Messrs. Lanchester & Rickards, of London.

New Municipal Buildings for Marylebone are proposed to be erected, the old court house in Marylebone Lane being wholly insufficient for the administrative work of the borough council and its staff.

Municipal Architecture.—At their last meeting the Edinburgh Town Council decided to leave on the table a memorial from the Edinburgh Architectural Association in reference to the disposal of the architectural work for the city.

One of the Loveliest Things in the World is a drain, said Sir Wyke Bayliss at last week's annual dinner of the Sanitary Inspectors' Association, but he hastened to add—"when it is consecrated by art in the form of a gargoyle on the roof of a cathedral."

Forgery by a Manchester Architect.—Mr. W. T. Singleton, described as an architect, 38 years of age, was charged before Mr. Justice Grantham at Manchester Assizes recently with forging a cheque for £5 and with uttering the same well knowing it to have been forged. The jury returned a verdict of guilty. Sentence was deferred.

Messrs. Mellowes & Co., Ltd., of Corporation Street, Sheffield, have secured the orders for glazing on their "Eclipse" patent imperishable system the roofs of extensions to works of Messrs. Stephenson & Co., Ltd., at Newcastle-on-Tyne; Head, Wrightson & Co., Ltd., at Thornaby-on-Tees; Cammell, Laird & Co., Ltd., at Sheffield; an electric car shed at Dumbarton; and West Kilbride Station, G. & S.W. Railway.

Bristol Master-Builders' Association.—The annual general meeting of this Association was held last week, when Mr. R. F. Ridd was elected president for the current year and Mr. R. F. Wilkins vice-president, Messrs. E. I. Neale, Frank N. Cowlin, W. Foster, E. Walters, A. Dowling, J. Lovell, F. Chown and E. A. Love being elected members of committee. The annual report stated that not for many years past had the building trade of the city been under such a cloud of depression as during 1905, but the downward tendency had now reached its lowest ebb and there was every indication of an improvement of the trade in the near future.

A Chronological Exhibition of English Architecture from the Norman conquest to the death of Sir Charles Barry in 1860 is to be held in connection with the seventh international congress of architects in the Grafton Galleries, London, in July next. In addition there will be shown a collection of oil paintings and water-colour drawings of architectural subjects by known painters. Many of these are scattered throughout the country in private collections. It is hoped therefore that all those who know the whereabouts of any such paintings or drawings will communicate with the secretary of the executive committee at the offices of the Institute, 9, Conduit Street, W. Such an exhibition of purely British work should be made as representative as possible in view of the forthcoming visit of our foreign confrères.

Gift of Stalls to Liverpool Cathedral by Mr. S. J. Waring.—A series of stalls of remarkable beauty and simplicity has been designed by Mr. G. F. Bodley, R.A., for Liverpool Cathedral, and the committee has just been informed that it is the intention of Mr. S. J. Waring (head of the well-known firm of Waring & Gillow, Ltd.) and his sons to present the entire series in commemoration of their long connection with the city of Liverpool, in which their business originated. The generous gift is, of course, a personal one, but although Messrs. Waring & Gillow, Ltd., do not contribute to it, it is anticipated that the work will be carried out by special workmen in their workshops. No exact estimate of the cost of the work can be given. Owing, however, to the great size of the stalls and the detail of the carved work involved, the cost will be probably not less than £8,000.

The L.C.C. School of Building at Brixton is to be lighted by electricity. Tenders will be invited.

A new Women's Residential Club has been opened at Hopkinson House, Vauxhall Bridge Road. It accommodates 120 residents.

For the Glasgow Royal Infirmary Reconstruction white freestone is to be used in place of terra-cotta blocks as at first proposed.

Mr. Lawrence I. Gomme, assistant librarian to the R.I.B.A., has gone to Montreal to take up a new position.

A Statue of Charles Kingsley was unveiled at Bideford last Thursday. It is of white Sicilian marble, 8½ ft. high, standing on a pedestal 9½ ft. high. The statue is by Mr. Joseph Whitehead, of London. New municipal buildings for Bideford (architect, Mr. A. J. Dunn, A.R.I.B.A., of Birmingham) and the Carnegie Free Library, built at a cost of about £60,000, were also opened on Thursday last.

Mr. Edmund Woodthorpe, F.R.I.B.A., surveyor for the northern division of the City of London, has been appointed to the eastern division also, and Mr. M. L. Saunders, A.R.I.B.A. (the present surveyor for the western division), to the southern district also—this in consequence of the death of Mr. H. H. Collins, who acted as dangerous structures inspector for the eastern and southern divisions.

A Lecture on "An English Monastery in the Middle Ages" was delivered by Mr. G. C. Snaith before the Sheffield Society of Architects and Surveyors last Thursday. The lecturer dealt principally with the Benedictine Order and its reformed branch the Cistercian Order. The causes leading to the foundation of Fountains Abbey, a house of the latter Order, were instanced as typical of those which led to the erection of so many of the beautiful abbeys of Yorkshire.

Concrete Steel.—At a meeting of the Engineering and Scientific Association of Ireland held at Dublin last week Mr. W. Noble Twelvetees, M.I.M.E., read a paper on "Concrete Steel in Engineering Practice," in the course of which he said it was by no means clear why engineers who did not hesitate to design in concrete or in steel should doubt the wisdom of dividing the work over the two materials. An important saving could be made by such combination.

The Underground Slate Quarries of North Wales formed the subject of a lecture delivered by Mr. H. Browning Button before the Birmingham Builders' Exchange on February 1st. The shipment of Welsh slates from Portmadoc, he said, averaged from 115,000 to 120,000 tons per annum. There had latterly been an increasing import of foreign slates, but these were unfit for districts where the air was charged with chemical fumes, and buildings on which they had been used had needed to be re-roofed with Welsh slates.

The Buildings of Mr. Kiralfy's Exhibition at Shepherd's Bush, which is to be opened next year, have been designed by M. Toudoire, the French architect who designed the Architectural Court of the Esplanade des Invalides at the Paris Exhibition of 1900. The principal entrance will be in Uxbridge Road, communicating with the entrance hall, from which will extend eight industrial buildings. From these the visitor will wander through Electricity Hall, the Indian Court, Congress Hall, the Transportation Building, the Court of Honour and a Salles des Fetes. At one end of the Court of Honour will be the "Imperial Tower," marking the centre of the grounds. From here the "Elite Gardens" will open out. In addition there will be a huge sports ground, with accommodation for 140,000 spectators, and a Court of Recreation.

MONTHLY

FIRE SUPPLEMENT

TO THE

BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

[Number 17. February, 1906.]

FIRES OF THE YEAR 1905.

BELOW we give a summary from the "Post Magazine" as to the fires of the year. As will be observed, the propaganda of fire-prevention is becoming more and more actively applied; not only in Great Britain but in the United States and Europe it is making itself felt, and the number of large fires continues to be on the decrease.

This is particularly notable in the Metropolis, where both the fire-preventive methods and the higher efficiency of the fire brigade has made an appreciable difference in the fire loss of the last two years. With the advent of another Building Act Amendment Bill in 1907, a few years hence must see a material reduction in the fire loss of the Metropolis, and gradually but surely the annual loss must be reduced within more reasonable limits than the figure of some 17 millions at which it was authoritatively computed at the turn of the century.

Whether the reduced fire loss will mean much reduction in premium for the insurer, we doubt, but in time such reduction will have to be made *volens volens*, particularly in respect to domestic tenement and office property, the premiums on which contribute so largely to the payment of losses in the warehouse and factory risks.

"Beginning with the fire experience at home, there is, we believe, nothing worse to chronicle than the somewhat disastrous outbreak in Long Acre in February last, when considerable blocks of buildings, chiefly in the occupation of coach and motor-car manufacturers, went down, and a large number of motor cars were destroyed, the loss reaching some £100,000. The introduction of the petrol motor has without doubt contributed a new source of danger, as may be seen from the fact that there were several other serious outbreaks, including a motor-car works at Leicester, damage about £5,000; a motor garage at Aberdeen, damage also about £5,000; and a bad fire at a similar risk in Bognor. As a consequence renewed attention has been given to this class of risk, with the object of minimizing the hazard. Dye works, unfortunately, have been much in evidence. Besides the loss of £70,000 in connection with the fire at Steiner's Turkey Red Dye Works, Church, near Accrington, there were five others of similar character—the Bradford Dyers' Association, Halifax; Gee, Samuels & Duggan, Lamberg; Hooton, Stray & Burgess, Colwick, lace dressers; Hall, of Yeaddon; and the Calico Printers' Association, Glasgow—which together absorbed more than £50,000. Drapers have not given quite so much trouble, the worst cases being in Ireland, where two drapery establishments went down in Larne for some £13,000, and a loss of £12,000 was made on a drapers' fire in Tralee. Scotland also contributed a serious drapers' and brush manufacturers' fire at Dalkeith, damage nearly £10,000. Co-operative stores were responsible for two large fires, one in Dewsbury and the other at Tyne Docks, which cost the companies about £6,000 each. Cotton warehouse fires were pretty frequent, Liverpool

alone having suffered from seven outbreaks, the aggregate loss amounting to upwards of £90,000; while there occurred quite a number of bad losses in the industrial and textile classes, including £33,000 and £6,000 on Bristol boot factories, £18,000 at Higham Ferrers, and £5,000 at Colchester on similar risks; £24,000 at Swansea and £15,000 at Sneinton, on hosiery factories; £15,000 on a worsted mill near Bradford; and others too numerous to mention. Perhaps the feature of most general interest in this connection is the destruction of three cotton spinning mills at Burnley, Haslingden and Bolton, with losses of £18,000, £16,000 and £20,000 respectively, which were fully provided with sprinkler apparatus. A loss of some £38,000 on the Peebles hydropathic establishment has drawn attention to the low rates ruling for this class, and the damage of about £7,000 to the Headland Hotel, St. Keverne, by incendiarism, should be noted."

NON-TARIFF INSURANCE COMPANIES.

IT is generally the proud boast of a newly-formed non-tariff insurance company that it will encourage *bona-fide* methods of fire-prevention by according rebates, and for this reason the advent of any substantial non-tariff company is naturally welcomed by large building owners, particularly when the requirements of the local Act necessitate them building better than they otherwise would.

A non-tariff office which was certainly managed on very broad lines in this direction was the Central Insurance Co., and by the attention it accorded to methods of fire-prevention deserved great credit. It also associated itself particularly with the giving of rebates for the installation of automatic appliances for notifying the event of a fire, more generally termed automatic fire-alarms. The Central Insurance Co. has, however, as has been the case with nearly every other non-tariff company of importance, joined the tariff ring, and must thus do its business under tariff-office conditions in future.

The association of this company with tariff offices is practically simultaneous with the announcement that the tariff offices had commenced affording a small rebate to automatic fire-alarm systems. We think we may be safe in saying that the Central Insurance Co. merits, to no mean extent, the credit of having obtained the recognition of automatic fire-alarms for rebate purposes. It also deserves the credit for certain movements—almost imperceptible in themselves, but substantial by their number—to be observed in the modification and improvement of fire-office rules and tariff conditions.

Thus the Central Insurance Co. during its existence as a non-tariff institution has certainly done good in the direction of fire-prevention itself, and has certainly influenced certain of the older offices in their policy. It is to be hoped that with the association of the Central Insurance Co. with the older offices some of its precepts will not be quickly

forgotten, and that the energetic management will yet continue to make its influence felt at the tariff-offices board in the direction of modernization in fire-office conditions, which in the first place means a more open and *bona-fide* recognition of efforts made to prevent fire or to reduce the possibility of spread of fire in warehouse and office risks.

Many expected that the success of the Central Insurance Co. as a non-tariff office would have encouraged the formation of other non-tariff offices on a sound basis, and that eventually there would be a non-tariff ring, similar to the tariff ring. For the present, however, and certainly for many years this is practically out of the question, but it is not unlikely that as years go on and the various old companies, by a process of gobbling up one another, become fewer in number, there will be some great split in the tariff offices on some question of principle, probably connected with the question of fire-prevention, and that if ever there be two distinct organizations in fire-insurance business the creation will be from within and not from without.

There are many little signs, even at the moment, that certain of the older offices, with managers of high business education and broad-minded views, are beginning to see the unwisdom of certain conservative methods which must sooner or later lead to a reaction; and should a group of these gentlemen be formed, it may become a question of a few years only and not of decades until the split takes place.

At all events, architects and builders will do well to remember that the whole of the insurance companies of note are tariff offices, with the exception of the Fine Arts Co.

PROTECTION OF THEATRES IN LONDON.

WE have pleasure in calling attention to the impending very excellent rearrangement of matters appertaining to the control of theatres in the Metropolis by which the London Fire Brigade receives a special theatre engineering department, so that parties having to deal with the London County Council on questions of theatre safety will in future only have to be in touch with the superintending architect and the chief officer of the fire brigade.

At present it is also necessary to be in touch with the chief engineer and the heads of his electrical and mechanical departments, and with a multitude of councillors negotiation was at times difficult. Even the public control department had occasionally to be consulted.

The new arrangement means the appointment of an electric lighting and mechanical engineer, two electric-lighting inspectors, and one heating inspector. The rearrangement of the work comes into operation as from April 1st, 1906. The arrangement should do much to abate a certain amount of dissatisfaction that existed among theatre owners and lessees as to the difficulty of finding out what was required of them.

GENERAL VIEW OF BLOCK B, LONDON OIL FIRE.

A LONDON OIL FIRE.

The Battersea Fire of January, 1906.

THE petroleum fire which occurred at Messrs. Bowley's petroleum store and refinery at Wellington Wharf, Battersea, again reminds us of the greatly increasing hazard in the Metropolis due to petroleum storage generally. The largely increasing number of motors and motor omnibuses, and in fact all forms of motor vehicles for commercial purposes, makes it imperative that petroleum should be stored in many premises entirely unsuitable for this purpose, besides which the sale of petroleum means much larger storage in bulk with merchants and refiners.

The site of the fire, which was on the south side of the river, was about as unsuitable a one for petroleum storage and oil refining as could be found. The buildings were of a highly inflammable character, and was only approached by a *cul-de-sac* of narrow width. On the one side was a dairy in which the timber roofing and a large amount of matchboarding was a conspicuous feature. On the other side were oil tanks. A plan presented herewith shows the general arrangement of the building.

From the plan it will be seen that the depth of the site was extraordinary compared to its width, *i.e.*, it was about 268ft. deep to a width of about 40ft. on the average.

Where the Fire began.

The fire is supposed to have commenced in that part of the building marked "D," and it is supposed that it was caused by spontaneous ignition of oil waste, as linseed oil was being stored in this building.

The section of the building marked "B" was the petroleum store, and the section marked "A" was the petrol store. The section marked "C" was used for the storage of empty casks also for oil boiling.

The other portions of the building were occupied mainly for storage purposes. Section "F" contained the offices.

The fire having presumably started in section "D," spread to sections "B" and "A," but was kept away from sections "E," "J" and "F."

The fire is one that speaks remarkably well for the efficient working of the London fire brigade and the salvage corps under exceptionally difficult circumstances. The

intense heat and the heavy smoke from this fire made the work of the brigade exceptionally difficult; in fact, had the wind been in a different direction, *i.e.*, off

the river instead of off the shore, the work of the brigade would practically have been impossible, and a serious conflagration would probably have resulted. As it was an excellent "stop" was made under most trying conditions; for the fire not only did not spread to the adjoining premises but part of the actual premises involved was saved, including a very important part of the offices, which were of a highly inflammable character—namely, of woodwork and matchboarding.

As a spectacle the fire was one of exceptional beauty, the oil running out on to the river and burning and floating on the top of the water. From a constructional point of view the interest is primarily of a negative character, as indicating in what extraordinary buildings petroleum is housed.

Technical Lessons.

Only in two cases do we find features of technical interest at this fire and that is the construction of the metal-framed doors, one filled with an asbestos packing and one with concrete slabs which both seem to have afforded considerable resistance to the high temperatures of this fire. The asbestos door had to be broken down by the firemen in order to gain access. The concrete door is shown in a photograph. The temperatures may be gauged by the appearance of the wreckage and the buckling of the stanchions, which we illustrate.

It would be well if in oil stores of this kind the doors from one section to another had raised sills to prevent the flow of burning liquid underneath closed doors.

FIREPROOF CONSTRUCTION THE ONLY METHOD OF REDUCING THE NATION'S ENORMOUS FIRE LOSS.

By Alcide Chausee, Superintendent of Buildings, Montreal, Canada.

THIS North America of ours is vast indeed; our natural resources are great, and we have grown to look upon them as inexhaustible. With ruthless abandon we have devastated our forests; we have worked our lands beyond endurance. Our mines, our fields, are handled without regard for the morrow. Within but a few years our economists have called our attention to this useless waste, and indeed we find ourselves already confronted by a scarcity of certain commodities hitherto thought unlimited. People are just beginning to awaken to the true condition of things.

Useless Waste.

Of all the useless wastes that we, as a people, have indulged in, in the United States and in Canada, that of fire is the most inane, for by it property is not only devastated but lives by thousands are yearly sacrificed.

Think of it! In 1904 7,000 people were burned, an average of nineteen fatalities through fire every day in the year, and a record that nearly equals that of all the railroad accidents of the United States and Canada, countries generally considered the most fruitful source by far of fatal accidents. And the record of 1904 was not an extraordinary one, the increase in deaths by fire has been growing steadily. Our present ratio is about nine lives lost by fire every year for every 100,000 of population. In 1900 the ratio was eight, and in 1890 it was five. Unless something drastic is done, what will the ratio be in 1950?

The loss of life is appalling, the loss of property is disgusting. One hates to think that he is part and parcel of such a race of stupids. Not even China and Japan, with their paper and bamboo houses, submit to such a tax as we do. Our fire losses are equal to a tax of 25 dollars per year per family, and that tax shows but the loss of property actually consumed. We have burned up one thousand million dollars' worth in six years. Most losses, so called, are really but exchanges; one product turned into some other form; a loss perhaps to many, but a gain to some. Not so with fire—that loss is final, absolute, and the visual one is actual. The only gain to anyone is an indirect one to the insurance companies who profit just so much more by the added anxiety after a fire that people have to be insured, and the insurance business is not run upon strictly philanthropic lines. The result of the transformation caused by fire is

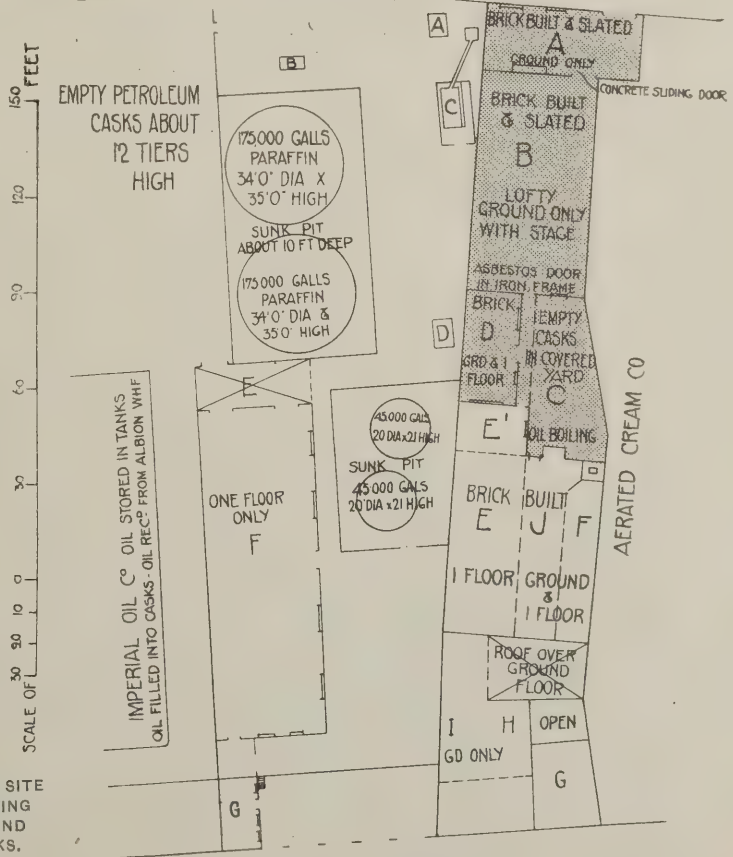

[Nothing But Smoke:

230,000,000 dollars' worth of smoke last year. As with last year's death record, the property loss does not show a spasmodic increase or something very extraordinary and unlikely to happen again. Even including the Baltimore fire, it was but little over the regular increase, a record that hovered about the sixty million figure in the 70's, the 100 million in the 80's and one that has not been under the 160 million limit since 1900.

And, mark you, that is the destruction of property. Along with that we throw away 150,000,000 dollars or so additional in maintaining and perfecting water plants and fire departments—salves to assuage the pain of the sore, not a cure for the malady. Then, on top of that, we go to work and gamble with the fire insurance companies and pay out countless millions more, so that they will reimburse us individually should we suffer a loss through fire.

For every dollar that the individual loser receives as indemnity, the community has

WELLINGTON ROAD

S. BOWLEY & SONS

LUDWIGSHAFEN FLOUR MILLS BEFORE THE FIRE.

paid out 3 dollars as insurance premiums. That is the average. I have in mind one city that has paid out in a given time 692,000 dollars in premiums, and that has got back 107,000 dollars for its losses by fire during the same period. An intelligent speculation to be sure, but, then, what gambling is intelligent?

Losses Not Reported.

But leaving aside the accessories, so to speak, and restricting ourselves to the actual destruction of property, the 230,000,000 dollars of last year means a daily average of 630,000 dollars. Now, large as that is, we were satisfied some time ago that it did not tell all the story. We draw those facts from the fire department records, insurance reports, &c., more or less fallible sources of information, and that are far from being all-comprehending. We were sure that there were hundreds of fires unreported in interior districts of uninsured property, and where there were no fire departments. So, early in February of 1905, the Society of Building Commissioners and Inspectors prepared a most elaborate system, albeit expensive, to get all the facts concerning fire for at least a short period. The system was in working order by February 19th, and was, I am sure, perfect on the 23rd.

A Million and a Half Dollars Lost a Day.

During the ten days of the test, from February 19th to 28th, there were 1,315 fires, totalling a loss of 14,809,000 dollars, or 1,500,000 dollars a day. True, it so happened that there were some pretty severe fires during that period, but, who tells us that there will not be as severe, or more severe, ones later on during the year as there were previous to that time?

Granted that a record of 1,500,000 a day

LUDWIGSHAFEN FLOUR MILLS AFTER THE FIRE.

will not obtain all the year round, and assuming, indeed, that we will not actually average more than half the amount, still the figure is exceedingly near the mark reached by the new buildings we are daily erecting and that give such a semblance of progress. At the most liberal estimate we build but 1,000,000 dollars' worth of buildings a day, hence we are destroying perilously near as much as we are creating. Talk of race suicide!

New York averages 8,700 fires a year, Chicago 4,100. We burn up three theatres, three public halls, twelve churches, ten schools, two hospitals, two asylums, two colleges, six apartment houses, three department stores,

two jails, twenty-six hotels, 140 flat houses, and nearly 1,600 homes every week of the year. We may say that every person who lives or has business in buildings is more or less exposed to danger by fire, owing to our recklessness or criminal carelessness or ignorance, but setting aside such broad terms, we have estimates that there are 36,000 lives daily in danger, that is, there are many people directly exposed to fire, people who escape from burning buildings, lives that are in imminent peril.

Palliatives instead of Prevention.

And what is being done to prevent this terrible loss? A little, almost hopelessly little, in the way of prevention, though much as a palliative. We throw water upon our fires (we are constantly endeavouring to throw it more scientifically), and expect the next fire to burn less fiercely because thereof. In San Francisco, for instance, there is little being done comparatively to improve the standard of construction. It is notoriously a wooden city, yet insurance rates are fairly low

because, forsooth, the fire department is so excellent. That is like extolling the advantages of a certain locality as a health resort. It may be miasmatic, yellow fever may stalk amuck; its houses and streets may be foul, but, glory be, its doctors are skilful.

As far as cure goes, note how little we have done. In all this broad land there are but 3,000 buildings that can be called "fireproof," and that very largely only in their structural parts, that is, fireproof buildings like those in Baltimore, whose steel frames and terra-cotta floors withstood the attack where all else about them, the stones, the marble, the wood went the way of all things combustible or destructible.

What is the Cure?

But two things will tend towards the accomplishment of that end, and neither water-supply or fire department is one of them. The first thing to do is to surround our old and dangerous buildings with safeguards to correct their worst faults where practicable, and to compel their demolition as soon as possible. The second is to absolutely bar the erection of combustible structures in the future.

Some would say that that would be a hardship upon the individual, for we have grown so accustomed to using wood that it seems to be a fixed mode of construction, sanctioned by time and custom, a sacred inheritance, any tampering with which must needs savour of sacrilege. Therein the folly.

There was a time when wood construction was true economy, indeed the only thing available. To-day wood is almost a luxury. Lumber has gone up so much in price (over 150 per cent. in the last few years), while the fireproof materials, brick, steel, fireproofing tile, cement, &c., have been cheapened in

LUDWIGSHAFEN FLOUR MILLS AFTER THE FIRE.

STEELWORK AND CAST-IRON AT THE LUDWIGSHAFEN FLOUR MILLS.

cost of manufacture. There is absolutely no economy in building even a simple cottage of wood. Granted that the first cost in the fireproof material is 10 per cent. more than wood, but consider the wear and tear, the maintenance, the insurance, and all those incidentals, and your frame cottage will have cost you in twenty years' time 30 per cent. more than a well-built non-inflammable structure would have done.

The deterioration in the value of a well-built fireproof building, fire-resisting in its finish and decoration, is but one-ninth of 1 per cent. a year, while that of the ordinary wood joists and stud partition affair is nearly 4 per cent. a year. Besides, such improved construction has a host of other advantages. Sound-proof, vermin proof, warmer in winter and cooler in summer, and in every respect superior to the old way of building,

No Superhuman Efforts Required.

Some weak-hearted ones would have us believe that to bring about those two conditions would involve superhuman effort, well-nigh an impossibility. But our cities have accomplished other reforms quite as revolutionary—so thought at the time—as this would seem to be. The people sometimes chafe at what they term the restraint of individual liberty involved in the enforce-

ment of drastic curative laws. But not for long. North American intelligence is such as to soon recognize the value of perhaps individual sacrifice involved in so great a public benefit. We may not hope, however, to bring the desired conditions about by mild persuasive preaching. It will take vigorous action, and the only action that will accomplish anything is the adoption of most stringent building regulations, and their strict enforcement by competent executive officers.

Building, in general terms, requires the

clearest definition and restriction, while every class of building calls for a thoughtful and comprehensive special legislation. If we think that theatre builders ought to enjoy certain latitude we have but to scan the record of the Iroquois Theatre. If it be suggested that dock-sheds are hardly worthy of special legislation, think of what happened at New Orleans. If wholesale warehouses be deemed unimportant, note what happened in Toronto. And so it is with every class of building. Nothing can be deemed unimportant, for that very building or class of buildings may prove the ruin of half your city.

Strict Regulations Necessary.

Strict building regulations, I say, are all-important and supremely necessary. Two hundred and sixty-four of our American and Canadian cities have realized that, for there either have been or are being adopted perfected building regulations in that many cities. One hundred and sixteen cities or considerable towns heretofore unprovided with a special building officer or department have the creation of such office under consideration. There are happy indices of betterment, however we may look, but it is just such societies as this, made up of thinking public-spirited men, zealous in the upbuilding of their several municipalities, that can do a world of good in facilitating this work, and bringing its consummation about even in our own times.

Of all the cities that have given most thought and earnest work to this matter, Cleveland easily takes the lead. Her building ordinances may be said to be the combined work of nearly all the building experts in the country. A vast sum was spent upon its preparation, every item was discussed by experts, and its effect upon the legal side of the question, as well as the technical, were carefully weighed by specialists, and the society of which I am an officer, the Inter-

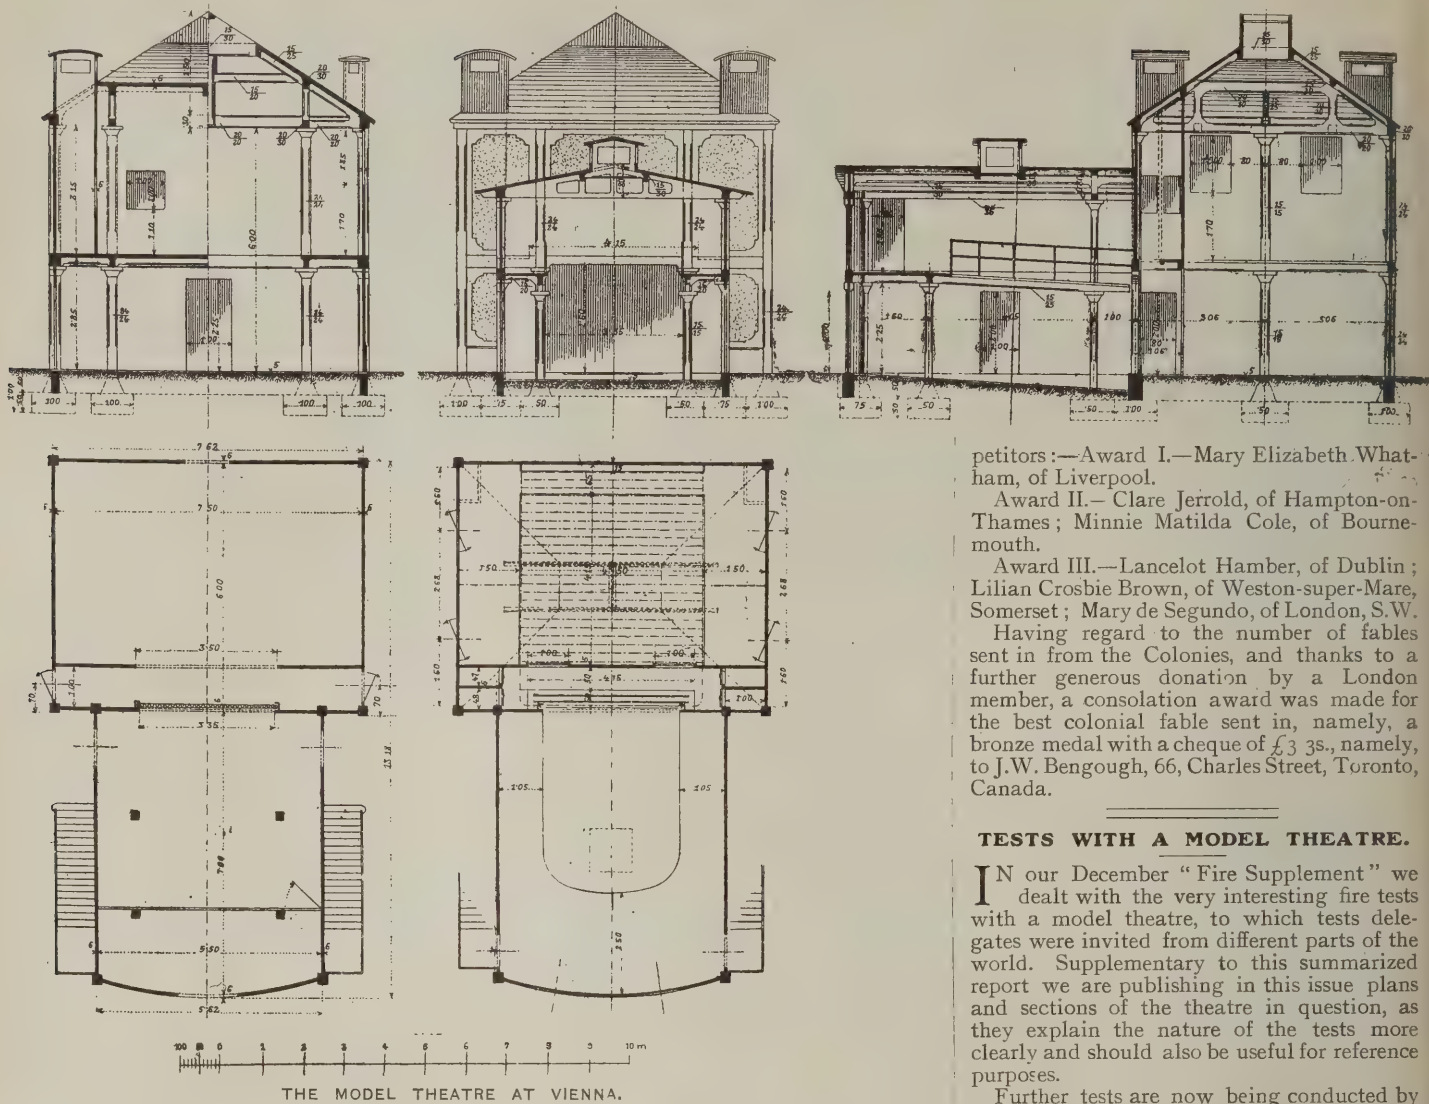

THE LUDWIGSHAFEN MILLS.

PLAN OF THE LUDWIGSHAFEN FIRE.

Blacked-in buildings completely burnt; strongly-hatched buildings partly burnt; lightly-hatched buildings untouched by fire.

national Society of Building Commissioners and Inspectors, has virtually advocated that ordinance *in toto* as its model and standard, and is urging every city in both countries to adopt it also with as little change as possible.

Some may think it verbose. It is complete, and leaves nothing to the misinterpretation or misjudgment of a perhaps too lax officer. Every point is covered.

Lax Building By-laws.

I submit, and readers will readily appreciate, that it would be a tremendous advantage to have a uniform code throughout both countries. As it is now, one city will permit of a certain thickness of brick walls to carry a certain height of stories: a city fifteen miles distant therefrom insists upon an entirely different standard. So it is with allowable strains in framing, &c. The building business of all the cities is so closely related that this everlasting difference is not only confusing, but leads to endless discussion and trouble. A hundred other considerations should compel us to advocate not only good building regulations, but uniform ones, and I sincerely trust that everyone will not only advocate in his own city the necessity of wise and strict requirements, but that he will go a step farther, and strongly urge the council, or whatever power is in charge of that branch of municipal service, to adopt the code that is most worthy of being made standard, and that has already been engrossed upon the laws of so many of the cities of these United States and Canada.

FIRE PREVENTION FOR THE YOUNG.

Fables for Children in respect to the Danger of Playing with Fire.

THE increasing loss of life and property owing to children playing with matches and with fire induced the Executive of the British Fire Prevention Committee to attempt a remedy by impressing upon children the dangers involved thereby. The Executive considered that warnings embodied in fables or stories, which are read at an age when children's minds are very susceptible to such impressions, would act as a deterrent against carelessness with matches and fire for the coming generation.

With a view to furthering this end the Committee were enabled through a generous donation from a Canadian member to offer the Committee's Gold Medal and a purse of £20 for the best fable for children calculated to serve as a warning against the danger of playing with matches or fire, and a competition was organized. This competition, for which 286 fables and stories were sent in, has been decided as follows:—

In the opinion of the Executive no fable merited the award of the Gold Medal and purse of £20. It was decided that the awards take the following form, namely:—

Award I.—A silver medal with a cheque for £10 10s.

Award II.—Two bronze medals with a cheque each for £3 3s.

Award III.—Three bronze medals with a cheque each for £1 1s.

The following were the successful com-

petitors:—Award I.—Mary Elizabeth What-
ham, of Liverpool.

Award II.—Clare Jerrold, of Hampton-on-Thames; Minnie Matilda Cole, of Bourne-mouth.

Award III.—Lancelot Hamber, of Dublin; Lilian Crosbie Brown, of Weston-super-Mare, Somerset; Mary de Segundo, of London, S.W.

Having regard to the number of fables sent in from the Colonies, and thanks to a further generous donation by a London member, a consolation award was made for the best colonial fable sent in, namely, a bronze medal with a cheque of £3 3s., namely, to J.W. Bengough, 66, Charles Street, Toronto, Canada.

TESTS WITH A MODEL THEATRE.

IN our December "Fire Supplement" we dealt with the very interesting fire tests with a model theatre, to which tests delegates were invited from different parts of the world. Supplementary to this summarized report we are publishing in this issue plans and sections of the theatre in question, as they explain the nature of the tests more clearly and should also be useful for reference purposes.

Further tests are now being conducted by the local authorities with various minor matter appertaining to theatre safety, and eventually a report will be issued embodying the various results of the tests, and also the results of the conference that was held at Vienna at the conclusion of the tests already described.

The model theatre was erected entirely in reinforced concrete, but was not subjected to any high temperatures, the fires also only being each of a few minutes' duration.

THE LUDWIGSHAFEN FIRE.

THIS fire, which we illustrate in some detail, is that of a very large flour mill on the River Rhine, which started in the early morning hours of December 13th last and resulted in the entire wreckage of these very extensive premises.

A plan showing the general arrangement of the building is presented herewith, and it will be observed that the buildings stand on their own land. Sections marked solid black were entirely gutted, whilst sections hatched were partially destroyed. The plan indicates the means of attack adopted by the local fire brigade, and we observe three floats were in operation.

The water-supply was of course unlimited, owing to the neighbouring river, the Rhine, but the hydrant service was apparently not satisfactory.

The views taken show the building before the fire, and further several views of the general wreckage. One of these shows how the whole of the ordinary single iron doors gave way, another to what extent the unprotected steelwork was damaged.

View showing heating apparatus and fused brickwork.

THE FIRE AT CHRIST CHURCH, DOWN STREET PICCADILLY LONDON, W.

General view showing damage to interior.

THE INTERNATIONAL FIRE SERVICE COUNCIL.

THE International Fire Service Council has just issued its fourth report dealing with its work during 1904-5. From the architect's point of view perhaps the most important step has been the organization of the special sections of the Council dealing with the various subjects that comprise fire-protection, and that one of these sections should be entitled the fire-preventive section.

The Council represents the whole fire and fire-preventive service of the civilized world, and we, in fact, observe that none of the most important countries of Europe are missing from the list of delegates. The delegates are appointed in certain ratio, in accordance with the population of the different countries. The fire service and fire-preventive societies represented have a membership of no less than three millions—an enormous number, who, generally speaking, by their loyalty to the cause of fire prevention which they have at heart become not only a great power on the subject in which they are specially interested, but also a power of considerable importance for the international relations and the amity of nations, a subject which, by-the-by, is also accorded a special section in the Council, and one of no mean order.

The president of the Council for the current period of four years is Lieut.-Colonel Meyer (Copenhagen), and the vice-presidents in alphabetical order are Mr. Cazier, of France; Mr. Edwin O. Sachs, of London; Count Szechenyi, of Budapesth; and Chief Officer Westphalen, of Hamburg. The second vice-president named, together with Chief Officer Dittman, of Bremen, Mr. Ellis Marsland (district surveyor of London), Mr. Modersohn (city surveyor, Unna) and Professor Woolson (of the testing laboratories of New York), comprise the sectional committee in fire-preventive matters.

That fire-preventive matters have not been neglected by the Council in their arrangements for the various conferences can be easily seen from the records of the fire-preventive congresses that have taken place; and it is a matter of interest to observe that the question of the fire-resistance of reinforced concrete is on the agenda paper for discussion at the next International Conference at Milan.

The Council has the advantage of a great influence, moderate means, and a large number of skilled voluntary workers, and it may be anticipated that its work and sphere of usefulness will rapidly increase.

Obituary.—We regret to announce the death of Mr. Grinnel, the inventor of Grinnel sprinklers. He was a resident of the United States.

FIRE TESTS.

AS we go to press we observe that the British Fire Prevention Committee is again undertaking an important series of tests during next week, i.e., on the 21st and 22nd inst.

Of highest importance will be the second experimental test undertaken by the Committee with a concrete floor measuring 22ft. by 15ft., supported by broad flange girders, the bays being reinforced by light metal joists. This test is a continuation of a previous test of last autumn in which Thames ballast concrete was used, but in this instance clinker concrete will be used for the bays, whilst coke-breeze concrete is used for protecting the broad flange girders, this coke-breeze being supplemented by expanded metal lathing and being 2ins. thick. Comparison between the two tests should be very interesting and of the utmost value, for nowhere have tests been so conducted on as large a scale with materials in common use with a view of obtaining comparative results. It is pleasant to observe that Messrs. Skelton & Co. have in both places provided the broad flange girders and have assisted the Committee in the preparation of the test, whilst the New Expanded Metal Co. have provided the lathing and executed the concreting, and the Associated Portland Cement Manufacturers have provided the Ferrocrete cement.

The conditions of test are similar to those for the full protective class—namely, a four-hours test, followed by the application of water for five minutes, at temperatures exceeding 1,800 degs. Fahr., the load being $2\frac{1}{2}$ cwts. per ft.

The second test will be with a floor measuring 22ft. by 10ft., constructed by the New Expanded Metal Co., comprising bays of broken brick concrete, reinforced by expanded metal lathing supported by ordinary joists, one protected by concrete, and the other with a form of plastering, in both cases on expanded metal lathing. The conditions of test will be identical, and it will be eminently interesting to compare the results of the effect of fire and water on the broken-brick concrete in comparison with the clinker concrete referred to above. Ferrocrete cement has been used in this aggregate as in the previous test, so that the cement factor is identical in both cases.

Two further tests during the week will be with a roller shutter door on the Kinnear principle, fixed by Messrs. A. L. Gibson & Co. in continuation of a test already reported upon in these columns in our supplement of November last. In the one case a single door will be tested and in the other a double door, and the study of the question of the expansion of these metal surfaces will, no doubt, be eminently instructive, seeing that their expansion is provided for by a system of slits to all rivets in the metalwork.

Next in rotation to these tests there will be a further second test with a reinforced concrete floor on the Coignet system in continuation of a test that took place last autumn, the dimensions of the floor to be 22ft. by 15ft., and the test for the "fully-protective" class. There will also be some tests with some wired-glass casements.

A series of non-proprietary tests are in contemplation in respect to bays of concrete with the various clinker, coke, and slag aggregates, in continuation of earlier tests in this direction, and with the particular view of examining the effect of fire on materials which have already passed through the ordeal of fire, such as clinker.

THE RECENT CHRIST CHURCH FIRE.

WE are showing two photographs of interior views from the fire at Christ Church, Down Street, Piccadilly, one of which is a general view, and the other, which is more important to the architectural profession, shows the heating apparatus.

The heating apparatus, which was of a type common to a very large number of churches, is clearly indicated, but what is even more interesting is that the brickwork is shown, which presents an appearance that is only obtainable after being affected by very high temperatures for protected periods. It would be well to remember that in these systems of hot-air heating the actual temperature reached at the stove and close around it is extremely high, and that there is a very considerable danger of a fire being started where the stove or the hot flues come into contact with combustible material. The isolation of the heating apparatus and its flues is of the utmost importance.

The church, which is a well known one, is covered by insurance. If we are not misinformed, the church was the scene of a small outbreak about a year ago, apparently from the same cause, which was, however, quickly got under.

The Calendar issued by the North British and Mercantile Insurance Co. gives an exceedingly interesting list of fires since 1870, and it is interesting to observe the losses on the various fires, which are as follows:—

28 millions sterling for the Paris fire of May 1st, 1871.
30 " " " " Chicago fire, October 8th, 1871.
40 " " " " Boston fire of November 9th, 1872.
6 " " " " Kingston fire (Jamaica), 1882.
10 " " " " Baltimore fire of 1904.

The Toronto fire of 1904 insurance loss was valued at £1,675,000. The great Cripple-gate fire of 1897 loss was valued at one million pounds. The year 1905 has been practically free from great conflagrations, the greatest fire apparently being the two New Orleans fires of February 26th and 27th, being £800,000 and £600,000 respectively.

HOMAN'S STEELED CONCRETE FIREPROOF FLOORS.

Constructional Steelwork of all kinds.

ROOFS, BRIDGES, PIERS,
JOISTS AND GIRDERS.

ALSO

GRANITE PAVING,
ASPHALTE, &c.

ADVANTAGES OF THIS CONSTRUCTION.

- Cheapest form of Fireproof Construction extant.
- Less Steel than other Systems.
- Bays securely tied together.
- Less thrust on Walls.
- Spans to 30 ft. without main Girders.

Another permanent enlargement of THE BUILDERS' JOURNAL will be initiated in our next issue in the shape of a "Contractors' Supplement." This, like our "Fire Supplement," which has been so much appreciated, will be published once every four weeks without any extra charge. The "Contractors' Supplement" will be devoted to the publication of matters of direct business interest and utility to those engaged in the building trade, and will contain several novel features.

A new House of Commons. It is very surprising that with all the agitation about the seating accommodation of the House of Commons whenever Parliament meets, no reform has been effected, but the reason is apparent when it is recalled that after a week or two at the beginning of each session the enthusiasm of members wanes and the House then has ample accommodation for the members in attendance. The agitation has proceeded for a long time. Forty years ago a Select Committee was appointed to enquire into the inconvenience occasioned by the smallness of the House. It is strange that Sir Charles Barry should not have made the House larger, for, seventy years ago, when the House was built, the Commons numbered 658 members. Of these only 306 can find a place in the chamber, although 122 additional members can be accommodated in the side galleries, but these are practically outside the area of debate, the reason being that members seated there cannot catch the Speaker's eye, as the galleries are level with the canopy of the chair. The Select Committee appointed in 1867 considered several

schemes for overcoming the difficulties, and the scheme that found considerable favour was to remove the walls dividing the House from the division lobbies flanking it, thus throwing this additional space into the chamber. This was abandoned, however, because the roof was found to be supported on the inner walls. Mr. Barry, son of Sir Charles Barry, the architect of the building, worked out a scheme of enlargement which was unanimously adopted by the Committee because it provided an increase of accommodation without interrupting the proceedings of the House. He proposed to erect a new House for the Commons in the Commons' Court adjoining the existing House. Here he found it possible to accommodate 569 members, 419 of whom could be immediately under the Speaker's eye on the floor of the House. The accommodation for strangers was also increased to 330. In addition, there were provided division lobbies, dining-rooms, tea-rooms, smoke-rooms and newsrooms; also suites of private rooms. It was estimated to cost £120,000, which would be doubtless considerably exceeded now. The old chamber was proposed to be untouched, except that the glass roof which was erected to overcome the bad acoustics of the chamber when the roof was open to the fine timber construction (still remaining above, obscured by the glass below) was to be removed. Of course, at that time the problems of acoustics were not understood, and no doubt this seemed an insurmountable difficulty, but nowadays we need not be troubled by the bad acoustics of the chamber without this false roof. It would be easy to overcome it by the provision of absorptive materials, such as felt on the walls and floors, padded seats, &c. The problem of providing additional accommodation has therefore rather a different aspect to-day, and we are inclined to think that a better solution could be offered than by the erection of a new chamber in the Commons' Court. Of course the question of interrupting the business of the House is a difficulty, but we are able to undertake building operations more speedily nowadays, and there is no reason why we should not be able to enlarge the present chamber, without seriously disturbing the business, by utilizing to the full the recesses between each session. The division lobbies could easily be thrown into the house and the roof supported by girders, while the compartments furthest removed from the Speaker could be thrown into the House without any trouble. If the galleries were then placed further away, the Speaker could, from his present position, see members seated there. Indeed, if his chair were raised, the canopy need not prevent him seeing the members at present. The acoustics, as we have said, could be better dealt with than by the provision of a false roof, and we could have the old carved roof exposed. The acoustics are complicated somewhat by the

ventilation arrangements, and if any reconstruction of the House takes place it would be a favourable opportunity to do away with the existing system of pumping air through gratings in the floor.

Cheap Chapels. In the "Methodist Times" we find the Rev. Herbert Windross seriously suggesting that the Manchester Committee might do a worse thing for Methodism than organize a "cheap chapels exhibition." He has in mind, of course, the Letchworth exhibition, which, he says, "demonstrated that it was possible to erect convenient, substantial and artistically-designed cottages for £150, instead of twice that sum, as usually charged." The Letchworth exhibition, of course, demonstrated nothing of the kind. But to return to chapels. The Rev. Mr. Windross is inclined to think that the people may feel that Methodist services and their buildings are out of harmony with the homeliness of their daily lives, and for this reason partly stand aloof. He says: "Let us look briefly at contemporary Methodist architecture. Open any recent issue of the Chapel Committee's report and it is obvious that of late years there has been a marvellous transformation in Methodist church architecture. John Wesley laid down rules for chapel-building which were observed for many years after his death. For generations Methodism built the plain square chapels, of which Carver Street is a type. But all such designs are now abandoned, and we are treated to architectural concoctions in imitation of every period of Gothic, from the purest style to the most debased, and all with towers, spires and pinnacles galore. Weird developments of Renaissance greet our bewildered vision, and the plain old chapels such as our grandfathers loved will be seen no more. Now we do not contend that it is advisable to return to this mediæval style of Methodist architecture. But we cannot forget that, according to all accounts, in those sometimes despised mediæval times the plain old chapels were filled, and filled with 'the common people.' In the plainness and homeliness of their chapels there was something with which the people were familiar, and they felt at home. Is it so in some of our modern Methodist mimic cathedrals?" There seems a grain of truth in this, for there is no need to imitate the form of buildings that served different ecclesiastical ideals, and there is no reason why a Nonconformist chapel should not be plain and simple and yet be artistic and refined; but the "mediæval" Methodist chapels—? those of early nineteenth-century date—hardly offer such examples, though we are willing to admit that there is undoubtedly too much over-elaboration of modern ecclesiastical buildings simply because the architects feel their inability to satisfy their clients with a building that is good unless it is bespattered with ornament.

CONCRETE MIXERS.*

By J. S. OWENS, M.D., B.A., A.M.I.C.E.,
F.R.G.S.

THE proportioning of the ingredients for making concrete, and the subsequent mixing together of those ingredients, are two distinct processes. It is impossible, however, to separate them in a paper of this kind. In some mixers the one machine performs both functions; in others the gauging of the materials is left to manual labour. There is, again, an intermediate type of machine which gauges the ballast but leaves the cement to be measured by hand. As the measuring of the ingredients must always precede the mixing it may be well to devote some consideration to the methods adopted for the purpose of ensuring correct proportions of the various materials before going on to consider the mixing machines proper.

Four Kinds of Materials to deal with.

The materials with which we have to deal have very different physical properties, and a method which is successful in measuring cement may fail entirely if applied to the measurement of broken stone or ballast. Concrete usually consists of a large proportion of coarse particles, such as gravel, broken stone or brick, cemented together by a mortar composed of sand and cement or sand and lime. This mortar must completely fill the interstices between the larger particles, and upon its strength (other things being equal) depends the strength of the concrete. We have, therefore, four separate materials composing the concrete:—(1) Broken stone, brick or other hard material such as slag or clinker; (2) sand; (3) cement or lime; (4) water. All these must be in their correct proportions. Sometimes the coarse particles and the sand are found forming a natural deposit having the proper quantities of each, such as Thames ballast. Our labour is then simplified to gauging three materials instead of four.

The ordinary method of gauging the ingredients for concrete by hand consists in filling the ballast or cement into boxes of known capacity. The quantity of water is determined by noting the consistency of the concrete; there is, therefore, considerable opening for variation in the amount, the personal factor having full play.

Turning now to

Mechanical Gauging.

the conditions to be fulfilled forbid complication or delicacy of parts. The measuring mechanism must fulfil its functions properly: it must not wear rapidly, and so require constant repairs or renewals; it must not clog with the cement dust or sand, and must work well with either damp or dry materials. The work must also be done either cheaper or quicker than it can be done by hand. The necessity for varying the relative proportions of the ingredients imposes a condition which it is very difficult to fulfil in a practicable machine. The result of experience of these difficulties has been to produce in some machines a compromise between hand and mechanical gauging, and in some of the most generally useful machines at present in use the gauging of the cement is still left to manual labour. This at once removes the trouble incidental to varying the proportions mechanically; the bulky materials and water are measured by the machine and the cement by hand. This method is adopted in Fawcett's patent mixer, in Arthur Koppel's, in Oehler's and others, and the result obtained is very satisfactory.

In mixers of the continuous type, which mix and deliver a continuous stream of concrete, the first essential to success is a continuous feed which will be accurate and not be affected by varying conditions of

* A paper read before the Civil and Mechanical Engineers' Society on December 7th, 1905.

THE CARY-LATHAM MIXER.

A, Mixing-cylinder; B, mixing-blades and scrapers; C, worm for delivering cement; D, cement-box; E, buckets for measuring ballast; F, buckets for measuring sand; G, ballast-hopper; H, sand-hopper; I, cement-hopper platform; J, water-pipe for mixing-cylinder; K, rollers for supporting and steadying mixing-cylinder; L, road wheels; M, framing for supporting machine; N, ladders for carrying sand and ballast bucket-gear; O, ladder for getting on cement platform; P, strap-driving pulley; Q, loose pulley; R, gear for driving mixing-blades; S, gear for driving mixing-cylinder; T, gear for driving sand and ballast buckets; V, arrangement for regulating delivery of cement; W, driving-belt; X, pitch-chain adjustment; Y, bags of cement.

the materials. The following methods of measurement may be mentioned:—

The Worm or Screw Conveyor.

This has been used with success for gauging the cement, the quantity delivered being regulated by changes of speed or by a sliding gate. This method is, however, seldom used now, as it is found to be practically as economical to measure the cement by hand. The Cary-Latham mixer (see Fig. 1) is, I think, the only machine in this country now using the screw for this purpose. Sand and broken stone are unsuitable for measuring by means of a screw, owing to the wear and tear which would result; a different method has, therefore, been adopted for dealing with these in the above machine. A bucket elevator, having a number of small buckets at intervals upon a chain, working over sprocket wheels, is made to take sand or stone from a hopper at the bottom and deliver it into the mixing apparatus at the top. This method is not often used where very accurate measurement of the materials is required. The amount of power consumed in scooping up each bucketful is considerable, and it is difficult to ensure each bucket being filled to the same extent from the hopper. With damp ballast containing sand clogging takes place and the capacity of the buckets is reduced. As an elevator, to bring material to such a level that it can be fed into the machine, the arrangement is very satis-

factory. When carefully attended to and in well-designed machines very excellent results have been obtained. The author is informed that the Cary-Latham machine (constructed by Messrs. J. H. Wilson & Co., Ltd., of Birkenhead) produces concrete having practically no variation in the proportions of the ingredients throughout the mass.

Another Method of Measuring

used is the revolving table, provided with pockets or boxes receiving material from a spout and delivering it through valves or doors to a hopper below. This is rather an ingenious method, and was used by Le Mesurier on his mixer designed for the Birkenhead Docks. He provided a belt elevator which passed beneath the revolving table. This table had hoppers of about 2 cub. ft. capacity arranged round the periphery, which were filled either by hand or direct from a stone-breaker, and on reaching a point over the end of the elevator they discharged their contents through a valve on to the band of the elevator. A similar means of measuring the materials has been used in a large Cary-Latham mixer, to be described later.

A Single-Bucket Device.

A measuring device somewhat akin to the chain and bucket elevator is used successfully on some of the best mixers, especially of the portable type. This consists of a single bucket designed to hold the exact quantity

of material required for one mixing; the bucket is made to ascend along a pair of guides by means of a wire rope attached to it; the rope is wound on to a drum which is actuated by a friction wheel. On arrival at the top the bucket is tipped automatically and the contents emptied into the drum of the mixer. To lower the bucket again it is only necessary to release the friction gear and manipulate the brake provided. When lowered it is again filled either by hand or by small tipping trucks which carry the stone or ballast to the elevator.

No provision is made in this arrangement for mechanically measuring the cement, which must be gauged by hand and thrown on to the materials in the bucket before it ascends with its load. This principle is adopted in the three machines previously mentioned—Oehler's, Fawcett's and Arthur Koppel's (see Figs. 4 and 5, illustrating the last machine). The measuring of the water is in some cases done by hand, the water being directed into the drum of the mixer in a spray until the proper consistency of concrete is attained. In Fawcett's and Arthur Koppel's machines the water is measured automatically in a tank provided with a ball tap and discharged into the drum of the mixer in a spray controlled by a lever.

This method of gauging the materials for concrete is applicable to "batch" mixers only, that is, to mixers which deal with the concrete in batches or charges as distinguished from the continuous mixers previously referred to.

In a paper read before the American Society of Mechanical Engineers last June by E. N. Trump, on "Continuous Measuring and Mixing of Crushed or Powdered Materials in Accurate Proportions," is a description of perhaps

The Most Ingenious Measuring Machine yet referred to. The principle upon which the Trump machine works is as follows:—If a revolving table of relatively large size has the material to be measured distributed in a thin layer upon it (as shown in Fig. 6), and a stationary knife or diverting blade is

pivoted so as to take off a predetermined quantity in one revolution of the table, as the layer of material is thin variation in the natural slope of the edge affects the accuracy very little, and as the table revolves the stationary knife diverts the material in front of it over the edge of the table and it falls in a continuous stream into the chute. This explains the principle. Now if the material is replenished on the table so that the layer taken off by the knife is restored to exactly the same shape as before and is continuously removed by the knife, an accurately measured quantity will be diverted. To arrive at this result a bottomless storage cylinder supported by arms from a central spindle, and revolving with the table, is added (Fig 7). The cylinder is somewhat smaller in diameter than the table and has its lower edge spaced a distance above the table sufficient to clear the knife. The material to be measured is filled into this cylinder and flows out a little under its lower edge, taking its natural slope. As the material composing nearly the whole base of the cylinder is cut away by the knife the space behind is continuously filled from above. The factors which influence the amount of material measured off in a given time by a machine of fixed dimensions are (1) the distance between

the bottom of the cylinder and the table, (2) the width of the knife, (3) the speed of rotation, and (4) the depth of cut of the knife. The first two are fixed and the last two made adjustable.

The proportioning of two or more materials is only a matter of the combination of two or more cylinders and tables (Fig. 8, next page). The tables are set one above the other and the cylinders arranged concentrically on the same spindle. Each table has its own storage cylinder or annular space and its own knife. As the material is directed over the edge of the upper table it falls into the material coming from the knife next below, and these two quantities fall into that from the third table, and so on.

It is stated by the inventor that the variations in size of the particles composing the material may extend from fine powder, like

ARTHUR KOPPEL'S MIXER.

cement, to rocks 6ins. cube. As an example of the accuracy of measurement with coarse material: In the case of a table 12ft. in diameter feeding rocks of 6ins. cube, the variation of delivery for a single revolution showed less than 2.5 per cent. and for ten revolutions less than 0.5 per cent. of the quantities delivered. About 6,000 lbs. were measured by the machine per revolution. With finely-powdered materials the variations in quantities by volume are considerably less than this. Compared with a hopper scale weighing the materials, the results of the Trump measuring machine are said to have been as accurate as the scales.

Mr. Appleby in his handbook of machinery thus describes a method of measuring used with the continuous mixer: "It consists of a machine . . . with two pairs of bins fixed over the mixer hopper and drop doors opening into it with appliances for controlling the deliveries. The larger pin of each pair contains the broken stone, shingle, &c., and sand, and is generally 1 cubic yard capacity; the other is of the size required for the specified proportion of cement. These bins being side by side, and each pair opening simultaneously (whilst the others are being re-filled), it follows that the contents become distributed before they enter the mixing vessel. The time occupied in filling the bins is rather less than that required for complete mixture . . . so that with the two pairs of bins the operation can be continuous if so desired."

The measuring is also sometimes done by running the ballast or stone to the mixing platform in tipping trolleys of known capacity, or hoisting it in skips holding a known amount.

There is also a method adopted in some American machines in which a series of hoppers are arranged side by side over a large roller, with a certain space between the outlets of the hoppers and the surface of the roller. These are kept filled with material by suitable means, and the revolving roller carries away a fixed quantity, depending upon the space left under the outlets of the hoppers and upon the rate of revolution of the roller. A machine on this principle is made by the United Concrete Machinery Co., New York, called "The Gilbreth Accurate Measurer and Feeder."

The same firm make a machine for "weighing and feeding," but the materials for concrete do not permit of accurate pro-

portioning by weight in practice. A little moisture in the stone or sand makes a great difference in the weight. There is also a tendency for moist sand to stick about the hoppers.

(To be concluded next week.)

Correspondence.

R.I.B.A. Fellowship.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Is it not time that the Council of the Institute settled the real function and purpose of the Fellowship? Is it (1) a means of providing money for the exchequer? (2) a means of keeping the Associates in check? or (3) a means of recognizing eminence in professional work?

The recent nomination and election of the group of really leading men might imply that (3) was the motive, and that the Institute wished to honour men of power and eminence, but many of us wish to know whether the secretary informed these gentlemen how the members of the profession have been implored and entreated to become Fellows (not, be it noted, Associates), and what a brilliant company of colleagues in the Fellowship has been and is being provided for them.

I should like to have an opportunity of expressing the widespread disgust and scorn with which the action of the Institute is regarded by all whom I meet; and as showing that this is not a merely personal expression of opinion I may state that I hold letters from most of the leading provincial allied societies strongly endorsing the protest of the Leeds and Bradford Associates, which I was instructed to forward to you and to them.

If the Institute sees fit to flout the strongly expressed protest of the allied societies in this way, and if the London men are content to be ignored, it will become necessary (and not for the first time) for the provinces to lead; and I think I can promise them an opportunity of voting by ballot on some of the nonentities who are rushing in to what was once thought to be the most honourable class of membership.

There are, of course, other methods still possible of bringing our views before the members of the Institute; and our members here feel so strongly on the matter that we intend to make it a test question in voting at the forthcoming Council election.—Yours truly,

FREDK. MUSTO, A.R.I.B.A.

LEEDS.

THE ACADEMY LECTURERS.

THE vacancies at the Royal Academy caused by the resignations of Mr. Alfred Gilbert, R.A., and Mr. George Aitchison, R.A., have not yet been filled, and the Professorships of Sculpture and Architecture still remain unassigned. The efforts to find members willing to undertake the duties of these positions have, says the "Morning Post," so far proved unavailing, in spite of the fact that the payment for the course of lectures is upon a more liberal scale than it was two or three years ago. The architect- and sculptor-members of the Royal Academy are all fully engaged with commissions just now, and to busy men unaccustomed to literary composition the preparation of lectures is a serious affair not lightly to be undertaken. For the present season a temporary substitute for Mr. Aitchison was found in Mr. T. G. Jackson, R.A., while Mr. Gilbert's place is being taken by Mr. W. R. Colton, A.R.A., Mr. W. Goscombe John, A.R.A., and Sir William Richmond, R.A., who will between them deliver the series of six lectures on sculpture. In the earlier days of the Royal

Academy the lecturers could say what they chose, and it is well known that Barry when Professor of Painting abused Sir Joshua to his face when the great president came to hear the addresses. But the lecture that caused the law to be made concerning the mentioning of living artists was delivered in January, 1810, by Sir John Soane, the founder of the Soane Museum in Lincoln's Inn Fields. Soane, an irascible and curiously obstinate man, showed in his lecture a number of drawings of architecture, ancient and modern, and pointed out to the students the faults and beauties of the examples chosen. The drawings included sketches of portions of Covent Garden Theatre, which had just been re-erected from the designs of another Royal Academician, Sir Robert Smirke, and these drawings were shown by Soane as examples of "gross incorrectness." Naturally this caused a sensation, and the lecture was speedily followed by the passing of a resolution of the Royal Academy council forbidding any comment or criticism on the opinions or productions of living artists.

Mr. T. G. Jackson, R.A., in his series of lectures completed last week took as his theme "Reason in Architecture."

NOTES ON COMPETITIONS.

Proposed Public Library, Southwark.

"The Council has appointed a committee to act as assessors in this competition," so reads the second clause of the particulars and conditions of the proposed public library, Old Kent Road, S.E. One's first impression is a thrill of pleasure that at last the principle of the jury system has been absorbed by an enlightened borough. The impulsive conclusion gives way to doubts that the thing is too good to be true, and enquiry proves that the millennium has not yet arrived, for the committee of assessors is to consist of laymen, councillors, assisted by the borough surveyor. And so the pendulum takes a big swing backwards, carrying with it yet another Carnegie library to be dealt with in the manner of a bygone generation. It is satisfactory to remark that the copy of the conditions on view at the library of the Royal Institute of British Architects bears a note that this matter is receiving the attention of the Institute. No doubt other interested bodies, as well as individuals who have applied for conditions, are endeavouring to show the promoters the error of their ways. Unfortunately for individuals in this case, as in many others, there is the difficulty of the deposit to contend with, this being only returnable (according to a baneful custom) upon the receipt of a *bona-fide* design. Those who have obtained conditions would do well to notify their bankers for the stoppage of their cheques, which done, the conditions should be returned with a letter stating the reasons for so doing.

Although every competition should be the subject of careful expert assessing, this is especially necessary in the present instance, owing to the difficulties presented by a very inadequate site. This occupies a position at the junction of Old Kent Road and New Kent Road, and is, roughly, in shape an equilateral triangle with sides of about 50ft. and a slight excrescence below the base. The site was a gift and appears to have been accepted with due regard to the advice given in connection with the proverbial horse. Except that the streets are noisy, the position is fairly good, but the area is insufficient. This will necessitate a library on several floors, with an accompanying complication of supervision; and taken in conjunction with the apparent impossibility of planning quiet reading-rooms, it constitutes the difficulty of the problem to be solved, and the reason why the highest expert

knowledge should be brought to bear upon the designs submitted.

A bad clause always appears more glaring when in the company of others which are sound. With the one exception the conditions of the Southwark library are good, and show evidence of care. This only makes it more regrettable that all are not equally as satisfactory. If by good chance the promoters should see their way to appoint a qualified assessor, they should also extend the time for receiving enquiries from competitors, the time mentioned in the conditions having already expired. The date for the receipt of plans should also be extended beyond April 2nd in order that those who have stood aloof may have a reasonable time in which to mature their schemes.

Some Thoughts on Carnegie Libraries.

The frequent failure of members of public bodies to realize their responsibilities towards those they represent, by neglecting to adopt the best means possible where the question of obtaining new public buildings is concerned, of which the case of the Southwark library is only another instance, brings uppermost once more the regrettable fact that Mr. Carnegie has, by his persistent refusal to interfere with such matters, lost an opportunity of benefiting to the fullest degree the recipients of his generosity. The public and architects both suffer; the former through not getting the most and best out of the gifts presented to them, the latter through being participants in competitions which end in disaster as regards the selection of the best designs, and through conditions being otherwise unfavourable. Nor does the evil end here. The greatest loss is that sustained by the noble art of architecture, by an elimination of the men most capable of producing fine buildings, through the ignorance and self-sufficiency of so-called responsible persons who support methods which no self-respecting architect can associate himself with. The R.I.B.A. has, as is well known, failed to move Mr. Carnegie to a recognition of these facts. Might it not be that a petition largely signed by architects, especially those in the habit of competing, would have a better result? The experiment anyhow would be worth making, for even if nothing were gained there is nothing to lose, and persistent solicitation often secures the desired end.

Perth Guildhall.

A special meeting of the Perth Guildry Incorporation was held recently to consider the report by Messrs. M'Laren & Mackay, architects, regarding the stability of the present Guildhall. The architects stated that they had examined the hall on May 26th, 1905, and found that the front wall was 7 ins. out of the perpendicular, while the interior was 9 ins. out of plumb. New cracks had developed, and old cracks had widened since they first reported on the matter. They considered the state of the building most unsatisfactory. Three different proposals were put forward at the meeting—one that the building should be sold, another that the front should be rebuilt and the interior remodelled, while the third was to build an entirely new hall and other premises and invite local architects to send in competitive plans. After considerable discussion the last-named proposal was adopted.

Hackney Central Library.

The designs submitted in the competition for a new central library at Hackney will be on exhibition in the King's Hall, Hackney, on Monday, Tuesday and Wednesday next, February 26th, 27th and 28th.

In reference to this competition Mr. Edward A. Jollye, A.R.I.B.A., of London, writes to us as follows:—

"Recently the promoters of the Hackney library competition issued to me, on application, a set of their conditions together with a plan of the proposed site for the library, for

which I forwarded £1 rs. After receiving these particulars I set to work upon sketch plans, but at the expiration of some ten days I had work brought to me to be executed at once, and had further work to do on completion of it. Seeing that my time was likely to be fully occupied, I had to abandon the proposal, and wrote to the town clerk explaining this fact and returned to him the particulars as they were sent to me and asked him if he would return the deposit. Eventually I received a letter from him saying his committee had decided to return me one-half of the deposit, namely, 10s. 6d., as I had not fulfilled the stipulation and sent in a design. Quite so, but as a perusal of the conditions must be a precedent to commencing a design, does it not seem a little ungenerous to take advantage of any intending competitor to charge 10s. 6d. for learning the advertisers' requirements? I explained that I had spent ten days on working at the scheme, which was an entire loss to me, whilst they received back their documents and they could reissue them, if demanded, to another would-be competitor. It is a small matter, but it involves a principle, and it would be interesting to know if this is the general custom."

A South-Coast Estate.

The Ashburton Building Co. have accepted (in competition) the designs prepared by Mr. R. Montague Luke, architect and surveyor, of Plymouth, for villa residences and the laying-out of the Druid Estate, and Mr. Luke has been instructed to prepare plans for the erection of two villas at an estimated cost of £1,000.

New Municipal Offices for Holborn.

At last Wednesday's meeting of the Holborn Borough Council it was decided that the present town hall in Gray's Inn Road should be sold and that new municipal buildings should be built, for which not more than six architects should be selected to submit preliminary plans, "and that they be paid an honorarium of 20 guineas each; that they be furnished with plans of the site and of the existing buildings; that in the consideration of the plans preference be given by the Establishment Committee to those showing an economical use of the land; and that the committee be empowered to consider the plans when received and submit a further proposition upon the matter."

Luton Secondary School and Technical Institute.

Mr. H. Percy Adams, F.R.I.B.A., the assessor in the competition for a secondary school and technical institute at Luton, Bedfordshire, has awarded the first premium to Messrs. Spalding & Spalding, of 15, Queen Street, Chapside, E.C. The designs submitted will be on public exhibition at the Luton Town Hall on Monday and Tuesday next, February 26th and 27th, from 10 to 4. The cost of the buildings was suggested originally at £6,000, but this sum has been considered by competitors as insufficient, and it will most probably be exceeded.

The Opinions of Two Noted American Architects.

The following opinions on competitions expressed at the recent annual convention of the American Institute of Architects by Mr. George P. Post and Mr. John M. Carrère, two of the best-known architects in the States, will be of interest to readers:—

Mr. Post said: "I think we must accept competition as a necessary evil, and then use our utmost exertions as individuals and as an Institute to see that competitions are properly inaugurated and conducted, and that the awards are made with fairness and propriety. Personally—and I speak with considerable experience in the matter of competitions, for I have during a rather long period of practice erected over fifty million dollars' worth of buildings, the greater part of which was gained in competition—I have not altogether a perfect reliance on the

ordinary expert jury. Except in the matter of competition for a design like that of a great monument, which is purely artistic in character, the expert should always be a practising architect or several practising architects, who know the practical solutions possible, and who can see, as the theorist cannot see, the whole problem as controlled by practical considerations. . . ."

Mr. Carrère said: "I have entered a great many competitions. I cannot tell you the exact number, but I think in my twenty-one years' of practice I have entered over forty. I have won five. I cannot say that it has been a profitable investment. Neither do I feel that I would not have arrived at the same end without going into these competitions. The spirit of competition, of friendly and legitimate competition, is born in us through the methods by which we work, and though there will always be competitions, and rather discouraging competitions, we should try to make them fruitful. There can be only a few reasons for a competition. One is the desire of the practitioner to increase his practice, and I think that is admittedly a failure. The same amount of effort, money and skill spent in other directions would produce better results. The other reason is to obtain the very best design, and I fail to see in this country or any other country that the most noted competitions have brought about results which could not have been obtained by direct selection. A third reason which is prevalent and which is natural is the desire to discover new talent. I do not sympathize with that at all. If a man has talent his day will come, and it should not come until he is prepared to make use of it. . . ."

"The danger with a system of competitions for the Government work is that it establishes an official type of architecture, which would not be the case if the men would start their design without the idea of winning the prize. To particularize: I do not believe there is a successful example anywhere in the world of a monumental building in which an order is the main feature unless there are two storeys. Now, the Government type requires four, five and six storeys, and our architects are obliged to crowd innumerable storeys into that order. But if I were invited into any such competition I would put in more than two storeys, and I have myself decided that way because it seemed the best solution presented. As I look around me in this country and pick out the buildings which to me seem most successful, I do not believe that the great majority of those buildings would have won the prize in any competition."

Obituary.

The late Mr. R. A. Withall, architect, of Putney, formerly of 29, Great George Street, Westminster, who died on January 28th, left estate which has been valued at £63,056 gross.

Hydraulic Power.—The annual report of the General Hydraulic Power Co., Ltd., has just been issued, and shows that there has been an increase in the receipts of the London and Liverpool undertakings from £123,548 in 1904 to £123,761 in 1905. A dividend of 7 per cent. is to be declared, an interim dividend of 2½ per cent. having been paid, and the balance to be carried forward is £1,126. The mains in London streets have been extended by 4 miles during the year, making a total length of 154 miles. At the end of the year there were 5,938 machines contracted for supply, of which 5,823 were connected with the mains, this being an increase of 225 and 274 respectively. At Liverpool the number of machines contracted for is 1,028, of which 1,026 are connected, the increases being 47 and 44 respectively.

THE SOCIETY OF ARCHITECTS.

Presentation of Gold Medal; Old Houses of the Cotswolds.

A MEETING of the Society of Architects was held on Thursday evening last at Staple Inn Buildings, Holborn, the chair being occupied by the president, Mr. A. E. Pridmore.

The Gold Medal of the Society was presented to Mr. Walter W. Thomas, J.P., of Liverpool, ex-president.

Mr. Ellis Marsland then read a paper on "The Architecture of the Cotswolds in the Sixteenth and Seventeenth Centuries."

The Effect of Materials on Design.

The keynote of this architecture was, he said, its simplicity, due in great measure to the isolation which the district enjoyed, but also to some extent to the sparseness of local materials. The staple was stone, good, plentiful and quarried on the spot. The oolite formation stretching right across the district provided for all necessities. Stone was used for walls, floors, roof coverings, chimney-stacks and chimney openings.

The only other material was wood, also plentiful, but of the hard variety and consisting mostly of oak, chestnut and beech. Of soft wood there was little; consequently the joiners' work was confined to doors and panelling. Window openings had the glass glazed directly into the stone mullions. Iron was scarce and confined to hinges and casements.

Dearth of Lead.

Lead had to be procured from a distance, and, therefore, was not available for roofs or flashings, but restricted to the setting of the window glass. This dearth of lead was obviated by the omission of all hips, and the roofs were carried through to gable ends, thereby producing the leading feature of the style. Yet, in spite of the absence of lead, the roofs were made sound and watertight.

The Masonry: Scarcity of Lime.

It had been urged that the stone walls of the Cotswolds, though of ample thickness, were imperfectly bonded, and the interior not solid but containing a good deal of loose material. As to the latter, that was undoubtedly true, but it should be remembered that lime was difficult to obtain and had to be sparingly used and confined to bedding and pointing the stones; a prodigal use of mortar was prohibitive by reason of its scarcity; lime had to be burned, and the only fuel available was wood, and the process was long and tedious. But although the walls were not altogether solid, yet the masons abundantly made up for this deficiency by reason of the excellent jointing of the stonework, which required little help from the cementing material, as many dry-stone walls testified.

Details.

The Cotswold style was a transition from the Tudor of the preceding century adapted to the materials and needs of the inhabitants. The landowner's occupation was the rearing of sheep; and although he prospered considerably, yet a certain economy was desirable in his building operations, so that there was little circular work or superfluous ornament, plain solid lintel and mullion being all he could afford. There was, however, an exquisite proportion in the work.

String-courses and labels were identical, always about 6 ins. deep, splayed and hollow moulded. The mullions were varied in section as time proceeded, having been originally hollow, then chamfered, and finally ovolo moulded, but always in the same proportion. The openings were from 15 ins. to 16 ins. wide, and the height varied from 3 ft. 6 ins. on the ground floor to 3 ft. in the gable—sometimes 3 ins. less.

The Gables.

so marked a feature of the style, were set at about an angle of 52 degs. In the minor buildings the roofs were carried over the walls, but the more important buildings had copings, the section of which was varied—sometimes flat, but more often in the earlier examples moulded. These projected over the walls just above the slates, and the space so formed was pointed up, thus obviating the necessity for lead or other flashings. A gablet or finial of stone made an appropriate termination.

The Chimney-stacks

were also a prominent and ornamental feature, rising squarely and solidly through the roof. They terminated with a hollow string-course. The flues were in most cases carried up separately and diagonally, forming in the process a pyramidal stopping to the base of the shaft and finished by a moulded cap, the detail of which became more elaborate as the Renaissance influence became stronger. The stone weathering worked on the base of the shaft was to be noted, coinciding with the pitch of the roof, under which the stone slates were tucked and pointed—again avoiding the necessity for lead flashing.

The Roofs

had to be strongly framed and pinned to support the heavy covering of stone slates. These slates were obtained from certain beds of the oolite by exposing the blocks of stone to the action of frost, which caused them to split up into laminations of the required thickness; these were shaped and sorted into a variety of sizes, the larger ones being used at the eaves, and others diminishing in size to the ridge; one or more holes were drilled in each slate into which oak or deal pegs were driven; the slate was then hung over the tile batten, and the underside between the rafters plastered with coarse plaster.

The valleys were formed by rounding the bed and cutting and shaping the tiles to fit the hollow in a very ingenious manner, so that no leadwork was required. The covering to the ridge was made from the ubiquitous stone.

Doorways and Porches.

A word might be said as to the entrance doorways. These had usually a deep stone lintel, over which the label or string was carried, and the sides and head were either chamfered or moulded according to the relative importance of the doorway or the character of the building.

Porches were not generally a feature, but at a later period they were added to the main building, as also wooden pents of a Renaissance character.

Planning.

If the dominant note of these old buildings on the outside was simplicity, the interiors also showed the simple life of the inmates.

The prevailing plan was a parallelogram, surrounded by stone walls, divided up by wooden partitions into more or less square rooms, and one marvelled in these days, even in the largest of the houses, at the absence of minor offices. Other buildings were L-shaped in plan, others H, but all were wanting in the modern ideas of comfort and privacy—one room opening out into another and doors opening straight into rooms. Yet they were comfortable enough so far as the individual rooms were concerned. The thick walls provided convenient window seats, and the wide and deep chimney opening suggested warmth and comfort; the limit of the length of stone obtainable made a compromise necessary between the lintel and the arch, so that we found a flat four-centred arch spanning the opening, yet not an arch, but formed of two pieces of stone acting as cantilevers with a vertical joint in the centre and a wood beam above tying the whole together.

Floors and Walls.

The floors were carried by stout oak or chestnut beams appearing below the ceiling, and with splayed or moulded edges appropriately stopped. Heavy wood lintels were placed over the window openings, into which the floor beams were framed, thus binding the whole house together.

The walls were either plastered or panelled in oak according to their relative importance, and the floors laid with oak or chestnut planking, or, if on the ground level, paved with stone.

The use of ironwork was limited, yet one came across some charming remains of case-ment stays and fastenings, iron scrap hinges and door knockers.

The Change.

This old Cotswold style lasted for about 100 years, and gave place to the Renaissance which eventually penetrated this remote district. Its coming was heralded by certain alterations being made in the old work, and subsequently when new buildings were erected the old style was given up and new forms took its place. This was inevitable. The old had its limitations in the height of rooms, which rarely exceeded from 7 ft. to 8 ft. The craze for lofty rooms, to meet the prevailing fashion, could not be met, except by altering the whole proportion of the architecture; so it went.

Mr. PERCY ADAMS ON SANATORIA.

AT the last meeting of the Leeds and Yorkshire Architectural Society Mr. H. Percy Adams, F.R.I.B.A., delivered a lecture on "Sanatoria." He said these might generally be divided into two classes—the American or cottage type, and the concentrated or hotel type. He expressed the opinion that for accommodation for anything like 100 patients the hotel type of sanatoria was a practical necessity, but for small establishments of about twenty beds the cottage type was probably the best from a purely medical point of view. No sanatorium built in England on the cottage plan had more than twenty beds, but on the Continent they sometimes had more than fifty patients. He argued that there was no economy in erecting buildings of a purely temporary character because there was so much in common between such structures and those of a permanent character. Speaking of the Germans as having been the pioneers of these institutions, many of which had been erected by insurance companies, Mr. Adams showed views and plans on the screen of a number of sanatoria, many of which he had visited, and gave details of their arrangements. He then proceeded to give the history of the movement, which resulted in the conception of the King Edward VII. sanatorium at Midhurst (now nearing completion), of which building he is the architect. Mr. E. R. Dolby, engineer, of Westminster, who has been associated with Mr. Adams in the erection of the King's Sanatorium, described details of its heating, hot-water service and electrical arrangements.

Remarkable Damage to a Church by Lightning.—During a recent storm the roof of Barsham Church, Norfolk, was struck by lightning near the top of the east window, the glass of which was perforated as if by a fusillade of shot. The current seems to have travelled down by the tracery—the mullions being damaged both inside and out—and in its descent to earth wrecked a large slab of Purbeck marble which formed the altar table, casting the pieces in all directions. The marble altar steps were torn up, a great hole was made in the east wall, and the chancel step splintered. The altar-cloths were torn to shreds and the carpet twisted up as though by a whirlwind.

Law Cases.

The Covering-in of Wells.—At Lincoln County Court last week a bricklayer named Randall brought an action against Messrs. S. & R. Horton, builders and contractors, for £50 damages under the Employers' Liability Act. In June last year Randall was engaged in lining a well, working about 15ft. down. The top was partly covered by boards, but a hole was left for lowering bricks. A brick fell through this hole and struck Randall, crushing his shoulder and collar-bone, and he was unable to work for about fourteen weeks. For the defence it was contended that negligence had not been proved, and that the covering to the well was constructed in the ordinary and proper manner. The jury found a verdict for the defendants, and Judge Sir Sherston Baker gave judgment accordingly, with costs, but he made plaintiff an award for £12 7s. 4d. under the Workmen's Compensation Act, and costs under Scale A.

A Question of Old Plans.—At Plymouth Police Court last week Mr. Francis L. Jillard, builder, was summoned for failing to give notice of his intention to erect a building in Francis Lane, and with erecting such building with insufficient frontage (contrary to the by-laws, section 53, 1883) and insufficient space at the rear (as required by section 3, by-laws, 1893). The facts were as follows:—In 1881 plans were submitted by a Mr. Steer, the then owner of the property, for the erection of two cottages on the land in question and on an adjoining piece. A cottage was actually erected on the latter piece. The land was sold at the beginning of 1882, and a Mr. Coode, the owner, put in a plan for a workshop on the site of what might have been the second cottage. The plan now brought forward was of this second cottage, which was not built. Mr. Jeffes, for the Corporation, said that if a man deposited plans in 1881 for a building, if that building was not erected and he parted with possession of the land, and if the next owner brought up a plan in 1882 for premises of an entirely different nature, then, as a matter of fact, the plan of 1881 was withdrawn. Up to the beginning of December last the workshop still stood on the premises. Then defendant left a notice at the surveyor's office asking for one of the inspectors to go and pass the foundations of the cottage, and he added a pencil note showing that plans were passed in 1881. The inspector at once told defendant that as no plans had been deposited he could not go on building. The surveyor gave defendant notice that complete plans must be submitted before the work could be proceeded with, as the plans submitted in 1881 did not hold good now. In 1883, 1893 and 1900 new building by-laws were passed repealing the by-laws previously in force, and it was a question for the Bench to consider whether it was ever intended that plans under certain by-laws should be brought up more than twenty years after, when fresh by-laws were in force. The by-laws under which the old plan was approved were made in 1860. Mr. J. W. Bickle, for the defence, contended that plans had been deposited in respect to the very building which had been erected, although deposited so far back as 1881. It was quite true that his client was not the owner of the property at that time. It had changed hands twice since then, but the purchaser would take the benefit in his purchase of all plans passed prior to his purchase in respect of this property. He did not believe there was any limit of time during which, after a plan had once been approved, a building should be commenced. It was quite true the building was only commenced in November last, but there had been a workshop there, and the walls were not taken down, nor were the

SCHOOL-KEEPER'S COTTAGE, COUNCIL SCHOOLS, SOUTH EALING.
F. H. GREENAWAY AND J. E. NEWBERRY, ARCHITECTS.

foundations destroyed. The same foundations were the foundations of the present house, and the walls of the present house included the two walls of the workshop. Plans passed in 1881 were good now, as then.—The chairman said the Bench were satisfied that no plans were deposited in accordance with the by-laws of 1883, and that the defendant was not at liberty to proceed to build upon the plans submitted in 1881 under the by-laws of 1860. But having regard to all the circumstances, they considered the demands of justice would be met by the infliction of a nominal penalty, and they accordingly imposed a fine of 20s. and costs, or a month.

Who is Responsible for lighting Obstructions.—At the Halifax Borough Court recently Messrs. Wadsworth & Sons, joiners, and Mr. H. Mitchell, builder, were summoned for not causing sufficient light to be placed near a street obstruction in connection with building alterations at Bull Green. Messrs. Wadsworth said that "providing a danger lamp was a mason's job," and the mason's contractor said the contract specified that the joiners should see to the obstruction. Mr. Lister Coates, architect, was called to speak as to the custom of the trade, and his evidence was that the contractor for the masonry was usually responsible.—The summons against Messrs. Wadsworth was dismissed; while Mr. Mitchell was fined 10s. costs.

Dispute about a Reservoir Contract.—In the Scottish Court of Session recently Lord Ardwall closed the record in an action in which Messrs. Low & Thomas, contractors, of Glasgow, sued the Western District Committee of the County Council of Dumbarton for the

reduction of the contract for the construction of a reservoir on Finlas Burn, near Luss, Loch Lomond, the ground of reduction being that the plaintiffs' offer had been formed in reliance upon the opinion of one of the defendants' engineers that the clay on the ground would be suitable for the puddle wall, whereas after the contract was entered into the defendants' engineers refused to pass the clay found on the ground. If the clay is got elsewhere the contract price will be doubled, and the plaintiffs seek the reduction of the contract on the ground that they entered into it under essential error. The defendants contend that the plaintiffs must abide by their contract, as they knew what was required of them.—The judgment of the Court will be given in due course.

"Legal Hour" for Dismissal.—An important point was decided in an action brought by the Birmingham Operative Bricklayers' Society at the Acock's Green Police Court last Thursday. A bricklayer named Marsh, engaged in building a station bridge at Acock's Green, was on January 29th given an hour's notice to leave, the notice terminating at two o'clock. The contention of the Society was that whenever the notice was given it should be regarded as given prior to the proper hour of finishing work, so that the man could complete his day. The defendants, Messrs. Henry Lovatt, Ltd., builders, Wolverhampton, held that they could not be bound by the Birmingham rules. It was the case of an unsatisfactory servant being complained to, taking offence, and leaving. The Bench, taking into consideration the whole of the facts of the case, decided for the Society with costs, but withheld the solicitor's fee.

NORTHFIELDS COUNCIL SCHOOLS, WEST EALING: VIEW FROM SOUTH-EAST. F. H. GREENAWAY AND J. E. NEWBERRY, ARCHITECTS.

OUR PLATES.

THE new elementary schools at South Ealing, illustrated in this issue, were completed last year, the architects being Messrs. F. H. Greenaway & J. E. Newberry, of 21, Queen Anne's Gate, Westminster. The design was selected in a limited competition, for which Mr. E. R. Robson was the assessor.

The site has an area of about 2 acres, with frontages to Little Ealing Lane and Weymouth Avenue. There are two main groups—a senior school of two departments for 400 boys and 400 girls, and a mixed school for 446 infants. The senior school, for boys and girls, is placed on the north-east part of the site fronting Weymouth Avenue, and the infants' school on the southern portion. The children's entrances are in Weymouth Avenue, and, therefore, away from the main road—a point of some importance. The school-keeper's cottage occupies the south-west corner of the site, with its entrance in Little Ealing Lane. It comprises three bedrooms, parlour, kitchen and small scullery, with a good yard for drying clothes.

This disposition of the buildings leaves playgrounds of ample size, good shape and entirely open to the sun; the natural fall of the land is advantageously away from the buildings, and the boys' and girls' playgrounds are well screened from the roads by the school. The infants' school has two entrances leading into broad and short corridors, from which well-ventilated cloakrooms and lavatories open. Double doors at the ends of the corridors lead into a central hall, around which are grouped eight classrooms. Convenient teachers' rooms and store-rooms are contrived over the cloakrooms—an arrangement which avoids waste of space. The senior school for boys and girls is designed on the same lines as the infants' school, and has four entrances (two for each department), with cloakrooms and lavatories adjoining. Broad corridors lead into a large central hall, with sixteen classrooms grouped around it. The hall is fitted with a movable screen, rendering each department self-contained. Teachers' rooms and store-rooms are arranged over the cloakrooms, with windows that command the playgrounds and allow of ample supervision. Spacious covered play-sheds are provided in each playground, so planned as to form covered approaches to the outbuildings.

The drainage and sanitary work throughout has been most carefully considered, it being of the highest importance to minimize the danger of spreading infectious diseases

in buildings where so many children are gathered together. The walls and ceilings are plastered, and a dado is formed of salt-glazed bricks around all the rooms, halls and corridors. The floors are solid throughout, those in the classrooms and halls being of deal, and those in the cloakrooms and corridors of granolithic paving. The warming of the school buildings is effected by a low-pressure hot-water installation, supplied from a large boiler in a central heating chamber. Fireplaces are also provided in the infants' school and for the teachers' rooms. The ventilation is effected (in addition to the windows, which are all made to open) by specially arranged air inlets, some of which are warmed in winter, and by outlets constructed in the ceiling of each classroom communicating with powerful extract ventilators in the roofs. The central halls are efficiently ventilated by what are known as "split ridges," extending the whole length of the halls.

These schools are said to be as economical as any that have been built to comply with the present requirements of the Board of

Education. The cost has worked out at about £13 per child, including heating, lighting, tar-paving, boundary walls, &c., but, of course, excluding cost of site. From published statistics we find that recent schools of similar character built by the late London School Board average considerably over £18 per child.

The general contractors for the South Ealing schools were Messrs. Joseph Dorey & Co., Ltd., of Brentford. The heating and electric-light work was carried out by Messrs. Strode & Co., of Osnaburgh Street, Regent's Park, and the tar-paving to playgrounds laid by Messrs. Constable & Hart.

The schools gave such satisfaction that the Education Committee decided to repeat them on a similar site at West Ealing—on the Marder Estate. These schools are known as the Northfields Schools. We give two illustrations of them on this page. The general contractor for this group was Mr. W. J. Dickens, of Ealing, the heating, electric-lighting and tar-paving contractors being the same as at the South Ealing schools.

R.I.B.A.

Mr. Guy Dawber on Furniture.

A MEETING of the Royal Institute of British Architects was held on Monday evening, the chair being occupied by the vice-president, Mr. Leonard Stokes.

Mr. E. Guy Dawber, F.R.I.B.A., read a paper on "Furniture," with lantern illustrations.

Tracing the development of furniture in England, the author said that nearly all the examples shown in MS. illustrations down to the middle of the sixteenth century were of an ecclesiastical character. Throughout each successive period the style of the furniture had followed that of the architecture, and if any special piece was required the same craftsman who built the church, monastery or castle made it, or at any rate had such control that in character and detail it assimilated with the building. Household furniture in the sixteenth and seventeenth centuries was characterized by simplicity and stability of construction; and as much of it had to be

Shifted from One Castle to Another

when any great personage moved, its supply was necessarily limited, and rooms were consequently sparingly furnished. The influx of foreign workmen from Italy and the Netherlands had hindered the development of a distinctive and national taste, and up to the close of the sixteenth century there was hardly a definite and decided tradition. After the design of furniture began to break through its ecclesiastical environment, when the Renaissance in Italy had developed in England, then we find a real national style gradually being evolved. Perhaps the most constructively perfect period of English furniture was the end of the sixteenth and first half of the seventeenth centuries, and though its design was based almost entirely on classical influences and detail, and the outlines may suggest extraneous origin, it retained a character essentially English and soon lost any trace of foreign influence. During the reign of Charles I. and for many years previous much furniture had been imported from Italy as well as the Netherlands. The Restoration, in 1660, caused a further influx of furniture and workmen from Holland, Flanders, Spain, and France.

In the eighteenth century many schools of craftsmen and cabinet-makers based their designs almost exclusively on the models of the leading architects of the day.

Sir Christopher Wren

had gathered around him a school of designers and carvers whose influence upon furniture makers was very marked. It was the age of constructive joinery and beautiful carving, and, whether in oak or deal, one single style and tradition permeated the whole country. The architect was the chief director in all matters of style, proportion and arrangement, and a great deal of the actual furniture was designed by him.

Two facts mainly contribute to the charm and interest of the furniture of bygone days: the first, that its form and detail were so admirably adapted to the material it was made of; the second, that it was always so singularly suitable to its environment.

Towards the close of the eighteenth century, though the design of furniture was still influenced by the architectural features and character of the houses it adorned, it began to show that the necessity for the two being absolutely in harmony was not considered essential, for a great school of specialists in furniture-making had arisen, and the association between the architect and the cabinet-maker was beginning to weaken, until it ceased to exist. About half a century ago, when perhaps domestic architecture in

England was at its lowest ebb, things reached such a pass that the fashion in furniture became absolutely regardless of architectural principles or fitness, and only the idea of comfort and luxury prevailed, until

The Inevitable Reaction set in,

and people, as they could no longer get new furniture which was not an eyesore, reverted to the opposite extreme, viz., the older styles of former days. Then came the difficulty which still exists—which particular style amongst those of the past to select. All, perhaps, are equally incongruous in modern houses, yet all appeal to people in different ways; and now that in the mind of the general public architecture and furniture have been definitely divorced from one another, it is the fashion to pick up pieces of furniture, quite indiscriminately, because they happen to be beautiful, quaint or old, and people fill their houses utterly indifferent to the effect produced. All this brings us back to one thing worth noticing—that throughout the periods when architecture flourished and was a living art furniture was the same, and very beautiful work was the result; but when there ceased to be any real tradition in architecture, at the same moment furniture died out.

Architecture and Furniture Inseparable.

The two are inseparable—they always have been and always will be; and just as to-day we have a real living common-sense style of domestic architecture, so also, with its development, will a real style of furniture arise. There is, undoubtedly, a great effort being made at the present time amongst many of our ablest designers and craftsmen to remedy this by producing designs for furniture original and artistic in treatment. There is still, however, too much inclination, in aiming at simplicity of form, to neglect the beauties of form altogether. Because mouldings have been excessively or wrongly employed, there is a tendency to abjure them altogether, so losing one of the main factors in creating beauty and interest. Of course, to class the whole of the modern furniture produced to-day in such a category would be absurd, for we have designers and craftsmen who, if only given the opportunity, can design and make furniture which can rival the productions of past ages. But until there is some settled standard of thought and tradition permeating the whole country, any efforts at design in furniture must be but isolated and individual.

The Architect's Duty.

The author said he did not suggest that an architect should design furniture, but he should have in his mind the house he is building finished and furnished complete, just as a painter has a mental impression of the last state of a picture he may only be beginning to put on canvas. That impression may be modified and improved in detail as the work proceeds, but the general scheme, the broad idea, will remain. For the architect, however, who is more thorough in his work and is not content with constructing the mere shell of his house there is much scope for excellent effects, by planning permanent fittings, such as book-cases, cupboards, side-board recesses, and so on. With the improvement in domestic architecture, which is so marked, the author felt sure that it would only be a matter of time before the public realized that good sensible modern furniture could be equally well obtained at a reasonable cost; and this result would be greatly helped if architects generally gave more thought and care than they do at present to the finishings and furniture of the houses they design.

Mr. Percy Macquoid proposed a vote of thanks to Mr. Dawber, which was seconded by Mr. J. D. Crace and supported by Mr. Maurice B. Adams, Mr. H. D. Searles Wood, Mr. Arthur Penty and Miss Eleanor Rowe.

THE SPOILIATION OF EDINBURGH.

BAILIE DOBIE dealt with "The Æsthetic Duty of a Corporation towards a City" before last week's meeting of the Edinburgh Architectural Association.

Referring to the retention and preservation of old buildings in towns, as at Nuremberg, where no building is allowed to be altered or rebuilt without the permission of the local authorities, he said that if this principle had been adopted as recently even as sixty or seventy years ago in connection with the "Royal mile" from Edinburgh Castle to Holyrood, and all the northern slope of the ridge; and if their forefathers had been wise enough, instead of filling up the Nor' Loch, to have deepened it and kept it clean and fresh, and at a later date had prevented the railway company from irretrievably destroying that splendid valley, they might have had in their very midst a picture which, he ventured to say, could not be equalled anywhere else in the world.

In another connection he cited the case of Paris and its regulations. There, he said, if a new building of importance was to be built, a model of it and the surrounding buildings was made so that the effect could be judged from all points of view. If such a course had been adopted in Edinburgh, would there not have been an outcry before it was too late against the mass of the North British Station Hotel, which dwarfed and destroyed by contrast the post-office and register house, and even seemed to put the Calton Hill itself out of scale, and would they have permitted the straight line of the Caledonian Station Hotel to cut off one of the finest views they had in Edinburgh?

Two Things to be done.

There were two matters which had to be considered—first, preventing the individual from doing anything which would impair the beauty of the city; and, second, the Corporation themselves making improvements, which meant the spending of money from the rates. With regard to the former, there were many ways of limitation. Feuing plans should be laid out for whole districts, instead of for merely the small piece belonging to a particular owner, regardless of the plan of his neighbours; and the local authority, which was at present both the Town Council and the Dean of Guild Court, should be strengthened from outside by artistic advisers, constituting a committee of taste. This committee might have a certain control over the decorative quality of the architecture, of the heights of buildings, the kind and colour of material to be used for construction, and generally with everything which affected the amenity of the city.

For many years Edinburgh has spent very little money on anything that assisted materially to develop municipal art. The rebuilding of the North Bridge was a striking example of a missed opportunity. Let this clumsy erection be compared with the graceful Alexander III. bridge thrown over the Seine a few years ago, or the new bridge over the Danube at Budapest, which were true works of art. And it looked as if they were again going to lose a golden opportunity by not adding something to Mr. Usher's gift and so secure a city hall worthy of the Scottish capital. In this, as well as other important public work, an architect either by selection or competition should be chosen rather than city officials, who had their own well-defined lines of work.

Thanks to private enterprise, however, there had been many fine buildings erected in Edinburgh within recent years. The most important of all was unquestionably the west side of North Bridge Street, built by the proprietors of the "Scotsman."

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

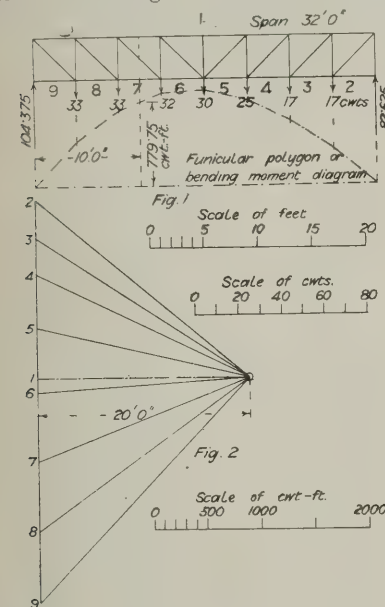

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Bending Moment on Lattice Girder.

DEVONPORT.—READER writes: "Required the bending moment, graphically and mathematically, from one end for girder as shown by sketch; span 32ft."

Draw the frame diagram of the girder as in Fig. 1, with the given loads hanging from the bottom flange. Number the external

spaces. Draw the line of loads, Fig. 2. Select a pole and draw vectors. Then construct funicular polygon (Fig. 1) by lines across the spaces parallel to, and numbered similarly to, the vectors. The closing line enables the parallel vector 0-1 to be drawn, giving the value of the reactions and enabling the subsequent stress diagram to be constructed. The bending moment at a point 10ft. from the left-hand abutment being required, this may be scaled off the funicular polygon as shown. By calculation alone, the bending moment at this point will be—

$$10 \left(\frac{7 \times 33 + 6 \times 33 + 5 \times 32 + 4 \times 30 + 3 \times 25 + 2 \times 17 + 17}{8} \right)$$

$$= (6 \times 33 + 2 \times 33) = 10 \left(\frac{835}{8} \right) = 264 = 779 \frac{7}{8} \text{ cwt.-ft.}$$

If the stress diagram be drawn out and the stresses scaled off, it will be found that this bending moment is resisted by the tension and compression of the flanges, the moment about the centre point of the brace being $2\text{ft.} \times 214 \frac{1}{2} \text{ cwt.} + 2\text{ft.} \times 176 \text{ cwt.} = 781 \text{ cwt.-ft.}$, which practically agrees with the above, the difference being due to slight errors in scaling.

HENRY ADAMS.

Buildings to Measure in South Wales and near Rushden.

ABERDARE.—D. H. M. writes: "Please name some buildings in South Wales suitable to measure for the R.I.B.A. Intermediate examination."

The following list gives a number of buildings in South Wales suitable for measuring for the R.I.B.A. Intermediate testimonies of study:—Thirteenth century. — Abbey Cwm Hir, Abbey Dore Church, Caerwent Church, Caldicot Church, Coy-

church, Crickhowell (restored), Llandaff Cathedral, Llanidloes Church, Llandysil Church, Malvern Church, chapel of St. Mary in the church of St. Woolos, Newport, Oystermouth Castle, St. David's Cathedral, Staunton Church, Strata Florida Abbey, Tenby Church, Tiddenham Church, Welsh Brecknor. Fourteenth century. — Brecon, church of St. Mary's, Coyty Church, Horgeston Church, Kidwelly Church (restored), Llandaff Cathedral, Llandyddid Church, Llantillio Crosseny Church, Monkton Priory Church, Marshfield, church of St. Mellons, Neath Abbey, Oystermouth Castle, Ross Church, St. David's Cathedral, Staunton Church, Tiddenham Church, Tintern Abbey. Fifteenth century. — Abergavenny Priory, Brecon, tower of St. Mary's Church, Cardigan Church, Coychurch tower, Llandaff Cathedral, Magor Church tower, Newport Castle, Ross Church, St. David's Cathedral, Tenby Church, At Chepstow the castle and church of St. Mary contain some good work of all periods.

H. Y. M.

NORTHANTS.—BILLY writes: "Please mention buildings to measure for R.I.B.A. within twelve-miles radius of Rushden, Northants."

Northamptonshire generally is one of the richest counties in England for churches, and the district you have chosen contains some of the most beautiful examples of ecclesiastical architecture to be found in this country; for within a few miles of Rushden, which itself contains a magnificent church, are the churches of Raunds and Higham Ferrers. The west window of Raunds Church, the west porch of Higham Ferrers Church or the roof of Rushden Church are features of exquisite beauty and eminently suitable for measuring as testimonies of study for the R.I.B.A. examinations. Other fine churches within the twelve-miles limit are to be found at Kettering, Addington, Braughton, Castle Ashby, Wilby and Aldwinkle.

H. Y. M.

Wren's House in Botolph Lane.

LONDON.—TECHNICAL writes: "Can you inform me where I can find a technical description—not a reporter's puff—of the house in Eastcheap standing between Botolph Lane and Love Lane, reputed to be the home of Sir Christopher Wren during the building of St. Paul's?"

An authoritative article dealing with this house, illustrated by a series of fine photographs, is in hand for THE ARCHITECTURAL REVIEW and will appear shortly.

Condensation in a Bathroom.

LONDON.—H. W. E. writes: "What is the cause of the hot- and cold-water pipes in my bathroom condensing water so much as to make the floor quite wet, and what is the best remedy? I thought perhaps an air-brick let into the wall against the ceiling would remedy the trouble."

As water comes in so much as to flood the floor one would think that leaks were the real cause. See whether the hot-water pipe does not leak where it joins the bath, as it may leak when much hot water has run through and expanded it, and close again when cold. If the joints be all good, and there be no very slight split in the hot-water pipe that opens when much very hot water expands the pipe, then search for wet coming in through the walls, as this really seems to be more likely than the condensation of the steam from a bath of hot water. If no drip or soak be found the condensation must be the cause, and ventilation, with warmed air if possible, is the cure. Placing the hot-water reservoir in the bathroom will give the most warmth, and two air-bricks, one near the ceiling and one at the floor near the hot-water reservoir if possible, will remove the vapour. If the bathroom be very small, the window had better be opened also at top and bottom when weather permits.

O. WHEELER.

Scantlings for Framed Floor.

STOKE NEWINGTON.—Q. writes: "Please show how to work out the scantlings for a timber floor with wood girders and wood binders. Assuming 2 cwt. per ft. super. on the floor, how much is taken on the two girders and how much on the binders? I quite understand the different formulae, but am in great doubt as how to apply them."

The writer's simple formula for the strength of fir beams may be applied to this case,

namely, $w = \frac{bd^2}{L}$, where w = safe load in

cwts. distributed (allowing a factor of safety of 7), b = breadth in inches, d = depth in inches, L = clear span in feet. You give no dimensions, but a floor as shown by accompanying sketch will serve to explain the

method. Commence first with the common or bridging joists. Assume them to be at 15 ins. centres and 10ft. span over binders. Then

$w = \frac{bd^2}{L}$, whence $bd^2 = wL$; but $w = 2 \text{ cwts.}$

$\times 10\text{ft.} \times 1'25\text{ft.}$; therefore $bd^2 = 2 \times 10 \times 1'25 \times 10 = 250$, say $b = 3$, $d = 9$, then $bd^2 = 3 \times 9^2 = 243$, which is sufficiently near the mark. Then the binders will have to carry 2 cwts. $\times 10\text{ft.} \times 15\text{ft.} = 300 \text{ cwts.}$,

whence $300 = \frac{bd^2}{15}$, or $bd^2 = 15 \times 300 = 4,500$,

and as $\sqrt[3]{4500} = \text{say } 16 \frac{1}{2}$, this would be the size of a square beam to take the load, which is impracticable, and a rolled steel joist must be substituted. A rolled joist to carry 15 tons over a span of 15ft. would require to be Dorman, Long & Co.'s *G 8, 12ins. by 5ins. by 39 lbs. The girders would have to carry two loads of 15 tons, each roft. from support, on a span of 30ft. This will give a maximum bending moment of $15 \times 10 = 150 \text{ ton-feet}$. The tabular value required to be found in catalogue will then be $8 \times 150 = 1,200$, say Dorman, Long & Co.'s G 6 C 6, 16ins. by 14ins. by 212 lbs. compound girders.

HENRY ADAMS.

The Clock Tower, Westminster.

CHISWICK.—A. H. A. writes: "I wish to make a model of the clock tower at Westminster (Big Ben) about 16ft. high. Where can I find a copy of the design, with measurements?"

There do not appear to be any published drawings of the clock tower at Westminster giving sufficient detail to enable you to construct an accurate model. Even in the library of the R.I.B.A. no record is to be found of the architectural features of this important work.

H. Y. M.

Safe Height of Pier.

DEVONPORT.—READER writes: "If 5 cwts. per sq. in. is taken as the safe load on a course of brickwork, and 112 lbs. as the weight of a cubic foot of brickwork, neglecting wind-pressure, to what height may a brickwork pier 4ft. by 4ft. be safely built? It appears to me that whatever the size of the pier, the height would be the same."

Permissible load 5 cwts. per sq. in., 144 sq. ins. in 1 sq. ft., 144 by 5 = 72 cwts. per sq. ft. required load. At 1 cwt. per cub. ft. the height to produce a load of 72 cwts. will therefore be 72ft., and will be independent of the horizontal sectional area of the pier.

This is, however, not a practical question or answer. High piers should be calculated by the Gordon formula, and, if exposed to the wind, allowance should be made for the bending moment it would produce.

HENRY ADAMS.

NEW VENTILATION TESTS.

LECTURING recently on "Heating and Ventilation" before the Edinburgh Sanitary Society, Mr. A. Mackenzie (of Mackenzie & Moncur, Ltd.) observed that the word "ventilation" was said to have been coined 200 years ago by a Dr. Desaguliers, who invented a fanning wheel, and the man who turned the wheel was called the "ventilator."

Explaining the extraction and propulsion or plenum system, Mr. Mackenzie said that in two typical schools in Edinburgh—one with the extraction system and the other with the plenum system—he had made experiments with a view to ascertaining the relative cost of each. In the school with the extraction system the air was changed five times per hour, giving an air-supply of 803 cub. ft. per pupil per hour at a working cost of .38d. per pupil per week, while on analysis the amount of carbon dioxide in the classrooms averaged 7.3 volumes per 10,000 volumes. In the school with the plenum system the air was changed 9.25 times per hour, giving an air-supply of 1,646 cub. ft. per pupil per hour at a working cost of 1.75d. per pupil per week, while the amount of carbon dioxide averaged 6.7 volumes per 10,000 volumes. The result, therefore, was that the plenum system gave .6 of a volume less carbon dioxide per 10,000 volumes than the extraction system, but this was only attained by supplying about double the quantity of air at $4\frac{1}{2}$ times the cost. Another objection to the plenum system was that the windows required to be kept closed, and this was bound to have an unconscious influence on the children as regards the general policy of having open windows in their homes. There was, however, no doubt, that the plenum system gave better results in a school situated in a district where the atmosphere was foul and polluted, although an arrangement of the extraction system might be adopted which would give similar results at less cost.

Trade and Craft.

Faience and Glazed Ware.

If we ever arrive at the day when that solitary New Zealander shall survey the ruins of London, there is no doubt that he will be much impressed by the building materials of our time. To his mind these will be in striking contrast to those of the earlier periods of the world's architectural history, which his archæology will have discovered. As regards stone, little or no change has taken place. In bricks, however, there have been great alterations in manufacture, the most important being that in connection with glazed bricks; also in glazed terra-cotta and modern sanitary goods in glazed ware. To those who can remember the controversy about the introduction of terra-cotta into towns, the advance in this comparatively short period will appear very great. The early terra-cotta work was not very satisfactory, but that obtainable to-day is a very different material. It is now largely made with a vitreous surface, and is also highly glazed in colours. Considerable advance, too, has been made with glazed bricks, the bricks of to-day being immeasurably superior to those at first produced. Whereas the dirty-white brick or the brown salt-glazed were the sum total of the earlier brickmakers' efforts, we now have an infinite variety of colours and tints of remarkable

uniformity and excellence. An equally great advance, if not greater, has taken place in the direction of glazed ware to meet the requirements of modern sanitation. The patterns in sinks, urinals, baths, lavatories, stable fittings, &c., &c., now produced in all the tints of the rainbow, are legion. In no branch of modern industry has there been a greater call upon the ingenuity of the workers. The amount of capital invested in this branch of the building trade is immense, and we feel that the architectural profession fail to realize their indebtedness to the industry and energy of the firms engaged.

Foremost in the development alluded to have been Messrs. Cliff, Burmantofts, Ingham, Wortley & Co. and Oates & Green—firms now united in the Leeds Fireclay Co., Ltd., an organization pursuing a vigorous progressive policy, which has led recently to the opening of extensive and elaborately appointed showrooms at 2 and 3, Norfolk Street, Strand, W.C.

On a previous occasion we dealt with these showrooms and the facilities they afford to architects for the inspection of sanitary goods fitted up with all accessories, as well as a very wide range of samples in the more ordinary materials such as bricks, tiles and glazed terra-cotta.

The firm has just issued a truly remarkable catalogue. This consists of nearly 600 pages and is produced in the very best manner. There are illustrations of all the most important varieties of goods manufactured by the various branches of the company, and full information is given respecting sizes, and constructional details as to how the parts are fitted up, with elevations, plans and sections, so that architects will find this catalogue of the greatest service in the preparation of working drawings and the solution of the many difficulties that occur in everyday practice. The catalogue, moreover, is a liberal education in modern sanitation

and the decoration and construction of buildings. Thousands of pounds have been spent on it.

The accompanying three illustrations which we take from its pages show some of the latest innovations of most current interest. The "Senex" bath is an interesting design, which bears some relation to our remarks made recently with reference to the provision of baths in the floors of rooms. This is almost a necessity in public institutions which have the care of feeble or invalid persons. The handrails and steps render it easy for such to get in and out without risk. This is only one of the many designs for baths which are not ordinarily found illustrated in catalogues, so that these specialities of the Leeds Fireclay Co. deserve careful study by every architect.

There are many kinds of urinals and w.c.'s illustrated and described in the catalogue. We give a section of one of the former, namely, a circular back urinal, consisting of a highly-glazed fireclay back with sole and pier in one piece. These urinals have a minimum of joint, and where joints must necessarily occur they are far removed from risk of incrustation.

As illustrating another division of the catalogue we show a longitudinal section through a very neat infirmity stove, with descending smoke flues, made in glazed faience. This pattern, known as the "Hull,"

THE "HULL" DOUBLE STOVE FOR HOSPITAL WARDS.

"SENEX" SUNKEN BATH.

has, among other places, been used at Haley Green Hospital, Stourbridge; the Royal Infirmary, Hull; the Royal Infirmary, Nuneaton; the Menstone Hospital, and the Hunslet Workhouse, Leeds. A novelty in this stove is the provision of a fresh-air inlet flue from under the floor, by which the air is warmed before entering the ward.

Other sections of the catalogue deal with lavatory basins and fittings, sinks, washtubs, hospital and laboratory fittings, stable and farm fittings, and drainage specialities such as pipes, junctions, bends, traps, &c. Last but not least, the company's productions in glazed bricks are particularly well illustrated, such as the many designs of angles, mitres, returns, arches and moulds and also special patented bricks like "the double stretcher," consisting of a brick with a keyed joint at the back which interlocks so as to give adequate bond while enabling an even face to be obtained on both sides of a wall; Cliff's patent bond, in which glazed bricks of small size are used with a filling brick, so cheapening the cost of glazed brick walls; and the well-known Hessel-Tiltman and Shephard

quality, and does not need a fancy cement to fix it, is another point in its favour. It is, as we have said, unaffected by frost and heat, and it is impervious to bacteria, fungi, &c., and is not injured by gases or moisture. "Durolite" is thus particularly adapted for hospital wards and corridors, operating rooms, Turkish and other bath-rooms, lavatories, underground subways, engine-houses, bakehouses, cold stores, &c. An extremely interesting novelty has recently been introduced in this tiling, namely, the reproduction of the graining of marbles, granite, carved wood, &c., so exactly true to the originals that it is difficult, without a very close inspection, to detect that the representations are not the actual materials. The reproductions are quite permanent, and the application of the company's process has been extended to the production of landscapes and portraits in permanent and natural colours on glass, wood, iron, &c. Messrs. Durolite, Ltd., also specialize in leaded lights and stained glass for domestic, ecclesiastical and other purposes to which ornamental glass is applicable. Their latest and most successful production is painted figured rolled glass, for which there is already a large demand. This is produced in one, two or three colours, and the effect is novel and pleasing. The possibilities of the process are indeed great, and enable coloured-glass windows, &c., to be obtained at remarkably low prices. The address of the company is 33 to 36, Camomile Street Chambers, E.C.

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics* :—

Retention of an addition in front of No. 198, Essex Road, Islington, on the application of W. H. Winder, on behalf of T. Singlehurst. (*Consent.*)

Projecting balconies at Nos. 93 and 94, Long Acre, Strand, abutting upon Wilson Street, on the application of F. Chambers & Son, on behalf of Odhams, Ltd. (*Consent.*)

Deviation from the plan approved on 20th October, 1903, for the erection of blocks of buildings on a site on the north-west side of Coldharbour Lane, Brixton, abutting also upon Lilford Road and Kenbury Street, so far as relates to an increase in the height of the buildings next Coldharbour Lane, on the application of E. E. Bird. (*Consent.*)

Buildings on the north-east side of Maida Vale, St. Marylebone, to abut upon Maida Vale and St. John's Wood Road, on the further application of V. S. Galsworthy, on behalf of the Governors of Harrow School. (*Refusal.*)

One-storey shops in front of Nos. 431 and 433, Edgware Road, Paddington, on the further application of Gardiner & Theobald, on behalf of Matthews & Sons, Ltd. (*Refusal.*)

One-storey shops in front of Nos. 435 and 437, Edgware Road, Paddington, on the further application of Gardiner & Theobald, on behalf of Meux's Brewery Co., Ltd. (*Refusal.*)

One-storey shops in front of Nos. 439 to 451 (odd numbers only), Edgware Road, Paddington, to abut also upon Maida Hill West, on the further application of Boehmer & Gibbs, on behalf of W. Hirsch. (*Refusal.*)

Retention of buildings between Nos. 7 and 9, Coldbath Street, Greenwich, with a forecourt fence at less than the prescribed distance from the centre of the roadway of such street, on the application of Cooper & Goulding. (*Consent.*)

Buildings on the north-east side of Wharf Road, Bethnal Green, with external walls at less than the prescribed distance from the centre of the roadway of such street, on the application of M. W. King & Son. (*Consent.*)

Deviations from the plans approved on 26th April 1904, under sections 13 and 42 of the London Building Act, 1894, for the erection of dwelling-houses to be inhabited by persons of the working-class, on a site abutting upon Leather Lane, Portpool Lane, Verulam Street and Baldwin's Place, Holborn, on the application made by R. Robertson, on behalf of the Housing of the Working Classes Committee of the Council. (*Consent.*)

New streets for carriage traffic on the Mortimer estate, Streatham High Road, Streatham, on the application of E. B. T'Anson, on behalf of Mrs. Mortimer. (*Consent.*)

New street for carriage traffic to lead from Trinity Road to Norwood Road, Lambeth, on the application of C. Death. (*Consent.*)

New street for carriage traffic in continuation northward of Oaksford Avenue, Wells Road, Sydenham on the application of W. Wilkinson, on behalf of T. Covell. (*Consent.*)

New streets for foot traffic only to lead from Uxbridge Road to Bulwer Street, Shepherd's Bush, and the erection of a building in connection therewith, on the application of H. Macintosh & R. J. W. Newman. (*Refusal.*)

The Theatres and Music Halls Committee also reported the following :—

Plans submitted by W. Cave, showing a proposal to form a gallery at the north end of the Æolian Hall, Nos. 135-137, New Bond Street. (*Consent.*)

Plans with regard to bazaars, exhibitions, &c., to be held at Chelsea Town Hall, on March 26th, 27th, 28th and 29th, and at the Royal Horticultural Hall, Vincent Square, from May 20th to June 3rd. (*Consent.*)

Plan submitted by Romaine-Walker and Besant, showing a proposal to provide additional exits from the orchestra and from the supers' dressing-room under the pit at His Majesty's Theatre, Haymarket. (*Consent.*)

Plan submitted by F. Matcham & Co., showing a proposal to erect gates across the open passageway from the Holborn Empire, Holborn, into Weststone Park. (*Consent.*)

Plan submitted by E. Stephens, showing certain alterations proposed to be carried out in connection with the exits from the Royal Victor Hotel (late Royal Victor Music Hall), Old Ford Road, Bethnal Green. (*Consent.*)

Notes and News.

The Baldachino at Westminster Cathedral, which Bentley is said to have considered the best thing about the building, is now being erected.

The Architectural Association of Ireland held its annual dinner last Wednesday at Dublin, Mr. H. Albergy, president, occupying the chair.

The new Episcopal Throne at Southwark Cathedral was dedicated on Friday last. It is of fumed oak, from the design of Mr. G. F. Bodley, R.A.

Llandaff Diocesan Architect.—The Bishop of Llandaff presided over a meeting of the Llandaff Diocesan Society at Cardiff on Friday, when Mr. F. R. Kempson, of Cardiff, was appointed architect in succession to the late Mr. John P. Seddon.

Sir William Richmond's Gladstone Memorial.—The recumbent effigies of the late Mr. and Mrs. Gladstone, upon which Sir William Richmond has been at work for some years, are now completed. The figures, in white marble, are life-size and lie side by side, a large crucifix between them. The top of the monument is of a shell-shape design, the flutings of which mingle with the feathered wings of the Angel of Watchfulness who, with outspread arms, supports a cushion upon which rest the heads of the recumbent figures.

Payment of District Surveyors by Salaries.—The Building Act Committee of the London County Council state, in connection with their proposal to pay district surveyors by salaries instead of by fees, that there are now eight districts vacant, two where the district surveyors are not acting owing to ill-health, and six where the surveyors are more than seventy years of age; "so that the present time is an exceptionally favourable one for a new system of payment." They recommend that the new scheme shall come into operation from April 1st next.

A Great Scheme of Rebuilding at Chelsea is to be carried out. Two big building enterprises have already been successfully undertaken there, by companies known as the Cadogan and Hans Place Estate Co., Ltd., and numbered 1 and 2 respectively. Now comes company No. 3, to carry out a huge clearance scheme involving some seven acres of much-built-upon land between the Fulham Road and the King's Road. It is said that 750 houses will be demolished, with churches, stables, &c., and that the majority of the existing streets will disappear. Two broad avenues, which will be planted with trees and will be called Sloane Avenue and Cadogan Avenue, will cross the estate in opposite directions. They will be each 60ft. in width. There will also be another 46ft. wide, to be called Draycott Avenue, running from the Fulham Road to King's Road.

CIRCULAR BACK URINAL.

patent partition bricks, Shoppee's patent dovetail bricks for vaulting and concrete floors, walls, &c., and Hall's patent hanging tiles.

We may mention, finally, that the glazes used by the company are all leadless, and are put on by only the most approved processes. The company also manufacture bathroom, w.c., and other metal fittings used in connection with their glazed goods. This is a good feature because only by such means can satisfactory results be guaranteed.

There are many coloured plates in the catalogue, but an adequate knowledge of the variety and excellence of the company's manufactures can only be gained by a visit to their showrooms.

"Durolite."

The grip or key with which "Durolite" opal tiling is fixed is non-rigid and thus allows for the difference in expansion and contraction of the tile and cement upon which and with which it is fixed. For this reason, when properly fixed, "Durolite" does not crack or craze. Moreover, as the key is not secured to the tile by a material affected by heat (such as pitch) it will not become detached from the walls to which it has been fixed. The fact that the backing "grips" immovably in any cement or plaster of good

Six new Secondary Schools for Cheshire are to be built at a cost of £62,000.

St. Mark's Campanile, Venice, will cost altogether £72,000 to rebuild. About half that sum has already been expended.

North Ormesby Hospital is to be enlarged at a cost of £6,875. Mr. J. W. Bottomley is the architect.

A new Vestry House to St. Mary's Episcopal Church, Aberdeen, has been built from designs by Mr. Arthur Clyne, F.R.I.B.A., of Aberdeen.

Woman Clerk of Works.—During the reconstruction of the Princes Theatre at Blackburn, just reopened, Mrs. Clarkson, daughter of the proprietor, Mr. Page, acted as clerk of works, exercising, we are told, "general supervision over the workmen and paying their wages."

The Kensington Borough Engineer, Mr. A. R. Finch (who has been in the service of the local authority for eighteen years), has been appointed engineer to the Kensington Borough Council, at a salary of £600 a year, rising to £1,000, in succession to Mr. W. Weaver, F.S.I., who resigns on a superannuation allowance of £500 a year.

A new Catholic Church at Bournemouth is being erected from designs by Mr. G. Gilbert Scott, of London. The nave will be 25ft. across, and the sanctuary narrowing to 18ft. The walls will be of brick, with Bath stone dressings. Messrs. G. McWilliam & Son, of Bournemouth, are the contractors.

A Bridge over the Surrey Canal, connecting St. George's Road and Neate Street, Camberwell, S.E., has been erected from designs by Mr. W. Oxtoby, borough engineer. The work was carried out by Messrs. Woodham & Sons, of Catford, at a cost of £3,969. The bridge is a steel lattice girder one of three spans, the total length, including approaches, being 410ft.

Asphalt Works for Ireland.—At Magheramorne, near the port of Larne, new asphalt works have been established by the Limmer Asphalt Co., Ltd. (Irish representative Mr. F. A. Porter, 13, Queen's Square, Belfast), for the manufacture of Limmer mineral rock asphalt and patent Lithofalt mineral paving. Magheramorne is a very favourable district, as it furnishes excellent limestone, free from flint and gritty substances—an important constituent in Lithofalt paving.

The Garden Suburb of Hampstead.—Of the 240 acres of the garden suburb proposed to be laid out at Hampstead, 55 acres would be for roads, 70 for industrial class cottages, 30 for the villas of clerks and persons able to pay about £60 a year, 20 for shops or houses from £60 to £100 per annum, 30 for houses of a value above £1,000 per annum, and 15 acres for still larger houses. Of £120,000 required to carry out the scheme, £65,000 had already been subscribed.

The Usher Hall: Latest Proposals.—In accordance with instructions from the Edinburgh Town Council, Mr. Thomas Hunter, town clerk, has prepared a report for the Lord Provost's Committee on the whole question of the new city hall for Edinburgh in connection with the late Mr. Andrew Usher's gift of £100,000 for the provision of a suitable building where good music might be heard by the people. There have been years of bother about this gift. Mr. Hunter suggests, as ways out of the difficulty, that the existing Synod Hall might be turned into an Usher Hall without extension and with only internal reconstruction; or the abandoned rebuilding and extension scheme might be taken up once more; or the present Synod Hall retained as an adjunct to a new Usher Hall fronting Lothian Road. None of these suggestions, however (says the "Scotsman"), can by any stretch of language be described as satisfactory.

The Brick Trade in the Black Country has been in a very depressed state for some time, but matters have now reached such a stage that in Oldbury (which is one of the largest brick-producing centres) there is every prospect of a number of works being closed.

New Council Schools at Blaenavon have been built at a cost of about £7,000, comprising a mixed school for 250 children and an infants' school for 150 children. Mr. J. B. Francis, of Abergavenny, was the architect, and Mr. Charles Cooke, of Hereford, the builder.

Duncan Street Corner, Leeds, has been transformed by the rebuilding of the north side of the busy thoroughfare running between Briggate and the Corn Exchange. Here two large shops and office blocks, with a small block between, have been erected in grey terra-cotta, the architect being Mr. Percy Robinson, of Albion Street, Leeds.

A Detailed Survey of the Site of Ancient Sparta is to be made the principal object of this season's operations of the British School at Athens—now that work in Crete is suspended. Serious attention will be given also to the remains of the Byzantine and Frankish periods, in which the province of Laconia is so rich. For this work the committee have secured the services of an able architect, Mr. Ramsay Traquair, of Edinburgh.

Sheffield Master-Builders' Association.—Mr. T. Roper has been elected president of this Association for the current year, Mr. G. E. Powell senior vice-president, and Mr. T. Eshelby junior vice-president. Committee: Messrs. J. Longden, J. Biggin, A. J. Forsdike, J. D. Cook, A. Mastin, F. Fidler, H. H. Hodkin, F. Turner, Walter Shaw, J. C. Warring, W. May, G. H. Bown, J. Vasey, W. Kirkham, J. S. Teanby, J. Dawson, junr., Charles Roberts and W. W. Mears.

Two Artesian Wells have recently been sunk at the Prince of Wales's Road Baths, Kentish Town, for the St. Pancras Borough Council, which give a supply of 30,000 gallons per hour. On account of the first of these wells having been reported as yielding no supply, it was on the eve of being abandoned when Messrs. C. Isler & Co. were consulted and proved a supply of over 15,000 gallons per hour by means of their system of pumping by compressed air. These satisfactory results induced the council to put down an additional well, which is carried to a depth of 480ft., and to permanently instal Messrs. Isler & Co.'s air-lift pumping machinery.

Calcutta and Bombay: A Comparison.—Calcutta has long been called the City of Palaces, but, said Mr. Charles Edward Buckland in a paper which he read before a recent meeting of the Society of Arts, the city is not generally considered to deserve the appellation, which has also been bestowed on Oxford, Bath and Genoa. Lord Lytton, with more truth, called Calcutta the City of Statues, of which there are a goodly number, chiefly of governor-generals and military heroes. If the appearance of Calcutta is compared with that of other cities of India it must be remembered that the grey stone which has made Bombay so beautiful is not available in or near Calcutta, and that the latter has to depend on burnt bricks and plaster as the material for its larger buildings. But Dalhousie Square would be a conspicuous feature in any town, with its fine public edifices and sheet of water. When Calcutta won the legend of "The City of Palaces," said Sir George Birdwood in the discussion following Mr. Buckland's paper, Bombay was an agglomeration of villages of tiled shanties and *kadjan* huts, and it was by the fervent genius of Sir Bartle Frere and the administrative ability and energetic devotion of Arthur Crawford that it was within five years transformed into "Bombay the Beautiful."

"The Sanitary Journal" (the organ of the Sanitary Inspectors' Association) now has its offices at 13, Victoria Street, S.W.

A Cottage Hospital is being completed at Moffat, on Selkirk Road, at a cost of about £1,000. Mr. Edward C. H. Maidman, of Edinburgh, is the architect.

An immense Ancient City of Mayos has, it is reported, been discovered in the Peten district of Guatemala by a French archæologist, Count Maurice de Péréguy.

"A Chat about Architects and Architecture."—Owing to the success of the first edition of this booklet, a second and enlarged edition of 5,000 copies has been published by the author, Mr. W. I. Chambers, architect, 11, The Green, Richmond, Surrey.

Messrs. Hukins & Mayell, architects and surveyors, of 76A, Westbourne Grove, W., have taken over the practice of the late Mr. W. H. Chaney, architect and surveyor, of 37 and 39, Essex Street, Strand, W.C. (and formerly of 30, Essex Street), and will continue the practice at these offices.

A Building in Memory of James Watt is to be erected at Greenock on the site of the house in which Watt was born, at the corner of William Street and Dalrymple Street. It will be Scottish Baronial in style and is estimated to cost £6,500. Messrs. H. & D. Barclay, of Glasgow, are the architects.

Dissolutions of Partnership.—The partnership between Mr. W. Clifford Parnell and Mr. J. Fred Fogerty, A.R.I.B.A., of Belfast House, Gervis Place, Bournemouth, has been dissolved, Mr. and Fogerty has taken into partnership Mr. George Brumell, A.R.I.B.A., with whom he will practice at the above address under the style of Fogerty & Brumell.—The partnership between Messrs. Davy & Salter, architects and surveyors, of Oxford and Maidenhead, has been dissolved; also that between Mr. R. A. Dean and Mr. P. Quinn, carrying on business as builders at Croydon.

An Excellent Advertisement has just been issued to the architectural profession by Messrs. Engert & Rolfe, Ltd., felt and asphalt manufacturers, of Barchester Street, Poplar, London, E., in the shape of an ingenious pair of pocket-dividers contained in a protective case upon which the firm's name is engraved. Such a memento is very serviceable and sure to be kept. Messrs. Engert & Rolfe's "Hair Bitumen" is now largely used for a variety of purposes, such as an underlining for every form of roof covering, as a sound-deadener in partition work, and in place of pugging under flooring. It is supplied in rolls 25 yds. long by 32ins. wide: thus each roll contains 200 sq. ft., or 2 squares. The list price is 9d. per yard by 32ins. i.e., 8 sq. ft. For sound-deadening purposes it is made of stouter substance than for underlining roofs.

The Stations on the Waterloo and Baker Street "Tube" will be all distinct by the employment of tiles of different colours. They have been designed by Mr. Leslie W. Green, A.R.I.B.A. The plans vary in shape and size according to the site available, but the elevations of those above ground are all alike, being carried out in glazed dark-red terra-cotta on a steel framework. The tile and glazed terra-cotta work is being executed by the Leeds Fireclay Co., Ltd. The Trafalgar Square and Regent's Park stations have no elevation. The former is under the south-east corner of the square, and has subways leading to the corner of the Strand (outside the post-office) on the one hand and to Cockspur Street on the other: while the Regent's Park station is under the flower beds in Park Crescent Gardens, and is approached, like that at Trafalgar Square, by a short staircase.

Complete List of Contracts Open.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
BUILDING:			
Feb. 22	London, N.—Portland Cement, &c.	Town Council	E. J. Lovegrove, Borough Engineer, Municipal Offices, Highgate, N.

Binding Cases for any of the above Volumes can now be obtained, price 1/9 each.

Contracts Open.

BOROUGH of DEVIZES.

TO BUILDERS AND CONTRACTORS, &c.
The Urban District Council of the Borough of Devizes invite TENDERS for the ERECTION of TWELVE COTTAGES and OFFICES, &c., in Gain's Lane, Devizes.

The plans and specification may be seen and a copy of the bill of quantities obtained, at the BOROUGH SURVEYOR'S Office, Devizes, on and after MONDAY, 26th inst., on payment of a deposit of £1 1s., which will be returned upon the receipt of a bona-fide Tender.

Sealed Tenders, endorsed "Tenders for Cottages," on the special forms to be obtained from the Surveyor, to be delivered on or before TWELVE NOON, MARCH 2, 1906, at the Surveyor's Office.

The Council do not bind themselves to accept the lowest or any Tender.

F. G. BILLINGHAM,
Town Hall, Devizes. Borough Surveyor.

CHELTEMHAM EDUCATION COMMITTEE.

TO BUILDERS.

Tenders are invited for the ERECTION of new SCHOOL BUILDINGS, to accommodate 1,100 children, for the Naunton Park District of Cheltenham, in accordance with Plans, Specifications, and Conditions of Contract, to be seen at the Offices of Messrs. CHATTERS and SMITHSON, Architects, 17, Regent St., Cheltenham.

Early application is requested for bills of quantities, which will be supplied by the Architects upon receipt of a deposit of £2 2s., to be returned upon receiving a bona-fide Tender.

Tenders, sealed and endorsed, must be delivered to the undersigned by TWELVE o'clock, on THURSDAY, the 22nd FEBRUARY next.

No pledge is given by the Committee to accept the lowest or any tender.

WILLIAM PRESTON,
Education Officer, Secretary.
Rodney Road, Cheltenham.

and Sold by
SIMPKIN, MARSHALL, & Co.,
Stationers' Hall Court.

And may be ordered of any Bookseller.

If you
have anything
to sell

or if you want to buy anything, if you require a situation, or if you have a berth vacant, the best medium for advertising your want is **THE BUILDERS' JOURNAL**. Advertisers in our Miscellaneous Columns obtain most satisfactory results, and we frequently receive letters stating that an advertisement in the Journal brings immediate replies.

"A first rate medium for Situations wanted, I have received several answers to my advertisement," writes an advertiser who obtained a situation after inserting an advertisement in our columns. This is only a sample of what we are constantly hearing. Write your advertisement clearly and send it to the Manager, Builders' Journal, Great New St., Fetter Lane, E.C.

It will
bring you
results.

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.

OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C.

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Ruffling the Associates. ASSOCIATES of the Royal Institute of British Architects up and down the country—more especially at Leeds—have been getting very uneasy about what they deem to be wholesale elections to the Fellowship. We have published letters in other issues. Now comes a further protest from Leeds. The Associates there say that, if they could have the actual position and purpose of the Fellowship definitely explained, they would all know better where they stood. "Surely it may be assumed that the original idea was to make the Fellowship a sign of eminence, more or less; otherwise, why have a second class at all? And is not this confirmed by the fact of the subscription being higher? And does not the much-discussed resolution of the Institute—to shortly elect this class only from the ranks of the Associates—prove the same? If the contention that every competent architect has a right to election as Fellow is correct, it seems not only a hardship but an inconsistency to force him after this year to go through an examination. We cannot see what purpose of a worthy kind the Fellowship fulfils, unless it be to recognize a select or eminent class of men." In reply to this the Institute Council say they are convinced it is to the interests of the Institute that thoroughly qualified architects' whose age and busy practice preclude them from entering for examinations should become Fellows before the door is for ever closed against them: but they hasten to add that no further elections of that nature will be possible after December 3rd, in accordance with the resolution of the General Body passed a year ago. However, the Leeds Associates proceed thus: "Our views—which we have reason to know are very widely shared—seem to be much misunderstood in London. We are working solely for fair play and for the dignity of the Institute. So far are we from holding that the Associate's examination is the main essential, that we would willingly see entrance to our class widened, and a man's practical work accepted in substitution for some (or even all) of the examination work; so long as it was definitely ascertained that the conception and details were entirely his own. But, knowing the educational value of preparation for the examination, and remembering the constant emphasis hitherto placed upon it by the leaders of the Institute and the local societies, we are bound to insist that it is (1) unfair to the examined men, (2) derogatory to the dignity and consistency of the Institute, and (3) unworthy of the candidates as architects and gentlemen, to bring about this unseemly scramble for easy entrance to the Institute. . . . We must protest, and have already effectively protested, against the official recognition of men who hope by the Fellowship to obtain that entrance to the Institute which they have

been unable or unwilling to obtain as Associates. We also demur to men whose practice is chiefly connected with estate agency or kindred work. One other remark in conclusion. Of the present members of the Institute Council—excluding, of course, the representatives of the allied societies—we find that more than 75 per cent. have at some time qualified as Associates. The members of the Council have themselves justified our contention by starting to reach their exalted position by the Associate's gate." This is, of course, largely a personal matter, as well as one of wide bearing on the general attitude which should be adopted in regard to the Fellowship, and we do not intend to touch the personal aspect. With regard to the other side of the question, however, we certainly feel that the Associates are quite right in much of their contention. There can be—and possibly has been—too much of the "open door," and though a body of eminent men has recently gone in through that portal—men who for many reasons have hitherto desired to remain outside—we have a feeling that the influx has swept in some who do not really merit the honour. Still, whatever is the upshot of it all, we think the protest from Leeds will at least have the merit of calling to mind in future what Fellowship of the Institute really should be.

Registration Sub-Committee: Statement. THE Registration Sub-Committee of the R.I.B.A., consisting of the president, Sir Aston Webb, R.A., Mr. Edwin T. Hall, Mr. T. E. Collcutt, Mr. John Slater, Mr. J. S. Gibson, Mr. A. W. S. Cross, Mr. W. H. Seth-Smith and Mr. George Hubbard, appointed "to take evidence for and against the principle of registration and to suggest the course of procedure to be adopted at the general meeting when the present scheme of registration comes up for discussion," desire to state that they have held twelve meetings and taken the *viva voce* evidence of twenty-one architects practising in London and the provinces, a verbatim report of which has been preserved, and they hope soon to be in a position to report to the Registration Committee. This is a very interesting announcement. We shall await the report with much interest. The Sub-Committee is quite representative of both sides, and their views on this much-debated question should be valuable.

ROYAL ACADEMY EXHIBITION, 1906.

THE sending-in day for architectural works is Friday, March 30th, from 7 a.m. to 10 p.m. as hitherto. Will architects let us have their drawings as early as possible. We shall be glad to deliver them free of charge after making reproductions of such as we desire.

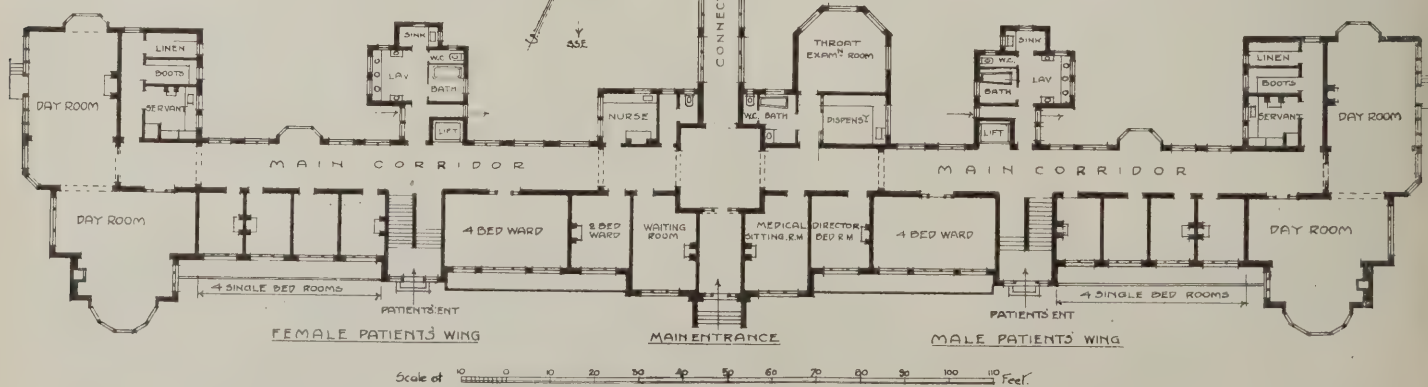

NURSES' HOME, CROSSLEY SANATORIUM.

CROSSLEY SANATORIUM.

THIS sanatorium, illustrated by the accompanying plans and photograph, and the general view given as a centre plate in this issue, is the gift of Mr. W. J. Crossley to the Manchester Hospital for Consumption. It has been built in Delamere Forest, Cheshire, occupying an elevated site, of about 66 acres in extent, two miles due north of Mouldsworth station. The sanatorium was opened last year. The terrace in front of the main building is 480ft. above sea-level, and to the south-east and west are magnificent views of the great Cheshire plain. As will be seen from the accompanying plans, the sanatorium comprises the following buildings:—The main building, where the patients are housed, the nurses' home, a pair of cottages for engineer and gardener, laundry-block and engine-house, bacteriological laboratory, and stables. At some distance from the main building (to the east) is the pumping station, where a perfect system of engines and pumps has been put down for the supply of water from the well, 504ft. deep. The main

building provides accommodation for ninety patients, medical director and two assistants; the patients being arranged in four wards of six beds each, ten wards with four beds, one with two beds, and twenty-four single-bedded rooms—all on the southerly side of the building. The windows of all these rooms are sufficiently wide to enable the beds to be placed lengthways at the same when open, or lifted on to the balcony outside. The building is basemented throughout, providing ample accommodation for douche-rooms, patients' cloak-rooms and dressing-rooms, X-ray room and storage spaces. The plan is self-explanatory; but it will be seen that a spacious dining-hall (60ft. by 32ft.) and chapel are provided in addition to the usual kitchen and stores, and separate dining-rooms for nurses and servants. The nurses' home is somewhat larger than present requirements demand, in the event of any extension of the sanatorium in the future. The other subsidiary buildings need little or no description. Suffice it to say that all the appliances in the engine-house and laundry are of the most modern

THE CROSSLEY SANATORIUM DELAMERE FOREST O

E. W. CECIL HARDISTY ARCHITECT.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

description. In the bacteriological laboratory no expense has been spared to equip it in the most thorough manner with the best-known scientific appliances. The whole of the "sputum" from the patients is taken here to undergo careful examination, and it is hoped that by the special attention given to this branch of the work of the sanatorium much increased knowledge will result. With regard to the architectural treatment of the buildings externally, an effort has been made to secure a bright and cheering effect by means of the colour of the materials employed rather than by elaboration of detail. The walls are faced in red Ruabon bricks to the first-floor level, the upper portions of the elevations being rough-casted in white spar with red brick quoins and strings. All the woodwork is painted cream-white, and the roofs are covered with red Ruabon tiles. The whole of the work has been carried out from designs prepared by and under the superintendence of Mr. W. Cecil Hardisty, architect, of Manchester. The general contractors were Messrs. I. Hamilton & Son, of Altrincham, and the clerk of works was Mr. John Broadbent. The cost of the buildings and furniture has amounted to more than £70,000.

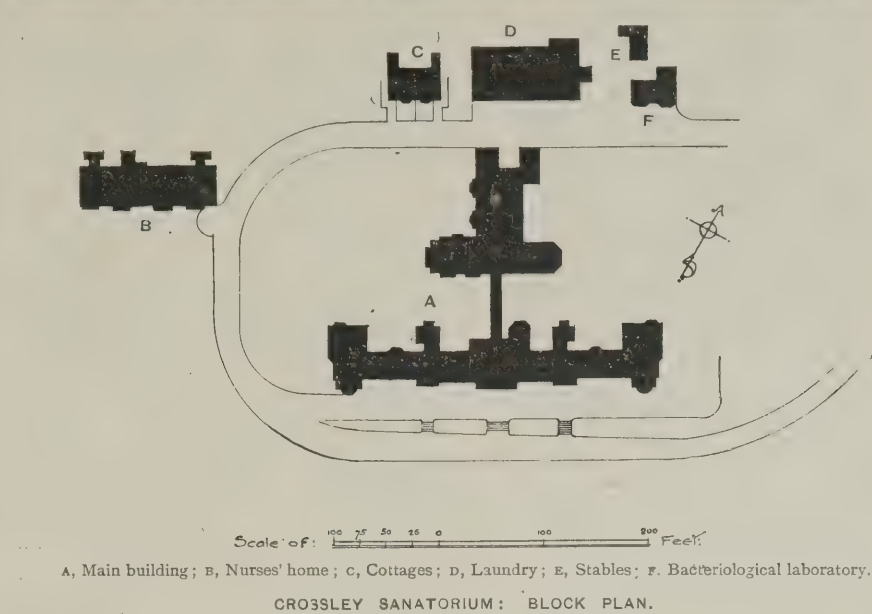

LABOURERS' COTTAGES.

An Irish Architect's Opinions.

IN a paper which he read recently before the Architectural Association of Ireland Mr. R. M. Butler gave interesting practical details of labourers' cottages. He said that to build a cottage—decent, roomy and commodious, and of so permanent and substantial a character as to need little or no repairs for several years—was simply impossible for less than £130 to £140. But, on the other hand, it was equally the fact that with £140 to £160 per house they could do this without having recourse to the bad expedient of temporary or semi-temporary materials. A good brick or masonry cottage could, and was being built, all over Ireland, for £150 or less, and that notwithstanding that building was at least as dear as in England. How did the difference arise? Merely that the Irish planned more simply. Of course,

The Average Irish Plan

was capable of much improvement. Generally, it consisted of a structure about 16ft. by 24ft. inside dimensions, divided into a kitchen, 12ft. by 16ft., and two bedrooms, each 12ft. by 8ft. Other plans provided a kitchen 16ft. by 12ft., and a single large bedroom on the ground floor of the same size, with one or two attic bedrooms, each about 12ft. by 6ft. In Mr. Butler's opinion the two-storey cottage was the best and cheapest type. Many Irish authorities, however, thought otherwise, but he held, as a *sine qua non*, that no cottage should contain more than three bedrooms, one of which should be of good size, and two at least should have fireplaces, more for the sake of ventilation than for heating.

Coming to details. Wherever masonry was cheap it was the best material to use, but 14in. brick or 10in. good concrete were also excellent. The use of 9in. brick walls or thinner concrete was bad. His ideal was a 20in. masonry wall, pebble dashed. In his opinion,

The most Economical Plan

of cottage was two rooms over two, or two over three, never three over two. The plan should not be frittered up in pantries and offices, but kept straightforward and simple, all within four rectangular walls. No return buildings or excrescences; these meant money. If a scullery and pantry were needed, and means permitted, he thought the best arrangement was a little lean-to. The practice adopted in England of frittering away the ground floor area in sculleries, and so forth, was bad in a two-storey, and ruinous in a one-storey, cottage. They had to build for in or about £150 in really substantial materials. Labourers neither required nor understood the use of pantries, larders, sculleries, parlours, baths or even privies. It would be well to educate them, but the time was not ripe, and the first essential was decent healthy housing. All the space within the walls should be devoted to kitchen and bedrooms.

Position of the Staircase.

The best place for the staircase (if there were an upstairs) was in the kitchen, and it should not be too steep, on account of children. The heights of the rooms was an important point. He thought 8ft. clear from floor to ceiling on the ground floor was abundant, and he saw no objection to omitting the plaster ceiling where there was an upper storey, and whitewashing the joists. In single-storey cottages it was a great mistake to make the roof open to the ridge, or the ceiling too high; it made

the house intolerably cold. Any money they could save was best spent in enlarging the area. The upper floor rooms should be about 4ft. to the wall-plate, with a good sized dormer, and even in the dormer he would use up-and-down sashes; casements caused great trouble. There should be three bedrooms in all cases, and in no instance ought one to open out of the other. In England some labourers' wives took great pride in having a little "parlour," but it was a non-essential, and in Ireland would be out of place. If there was no pantry, one or two cupboards and a few feet of shelving were most useful to poor labourers.

Everything should be strong and cheap. Hearths should be of firebrick on edge, set in cement. A stone set in the floor should be provided for chopping sticks. Cottages should be built near a supply of good drinking water, and all roof water should be collected in a big well-painted barrel, which was better than a galvanized tank. Plastering was best of two coats, twice lime-whitened. He did not favour concrete floors; he thought Chester tiles were much better, and nearly as cheap.

The Exterior.

As to the exterior, cement dashing was the only thing that would keep wet from getting through the walls in exposed situations. Projecting porches, unnecessary gables and ornament added to the cost; good ornament was very dear, and bad or commonplace ornament only an eyesore. In two-storey cottages a little string-course at the ceiling level improved the proportions by making the cottage look lower—and it cost little. He would like to see all cottages whitewashed with lime mixed with tallow, for it gave a nice clean appearance, and protected the walls from the driving rain.

THE CROSSLEY SANATORIUM FOR CONSUMPTIVES, DELAMERE FOREST, CHESHIRE. W. CECIL HARDISTY, ARCHITECT.

CONCRETE MIXERS.*

By J. S. OWENS, M.D., B.A., A.M.I.C.E.,
F.R.G.S.

(Concluded from p. 100, No. 576.)

PASSING on to the actual mixing of the ingredients after they are duly proportioned, we find that the processes employed fall under four separate heads:—

- (1) Hand-mixing.
- (2) Mechanical mixers of the continuous type.
- (3) Mechanical mixers of the batch type.
- (4) Gravity mixers.

"Dry" and "Wet" Mixing.

There are two methods of mixing, known as the "dry" and the "wet." In the former all the ingredients are mixed together before water is added, and again after the addition of the water. This is the method adopted in England.

The "wet" process consists in making the cement or lime and sand into a mortar with water, and then adding this mortar to the broken stone or shingle. This is not used in England, but is common in France.

The usual way in which hand-mixing is carried out here is well known and needs no description. The mixing is carried out on a smooth platform or "banker," and the "turning" is done with shovels.

There are certain drawbacks which are inherent in hand-mixing. The turning of materials with a shovel does not necessarily result in a thorough mixture, as much depends upon the way in which the shovel is handled. It should be given a certain twist, which it is difficult to describe and which results in a scattering of the materials. Again, it is necessary to exercise constant supervision over the mixing gang, or the work will be scamped. It is a process which may result in very well mixed concrete, or concrete which is neither mixed nor wetted properly.

The Two Types of Mechanical Mixers.

Turning now to mechanical mixers. There are, as pointed out, two types—"continuous," giving a continuous delivery and requiring a constant and steady feed; and "batch" mixers, which take a single charge of materials into a receptacle, where it is mixed. On being discharged the vessel receives another supply, and so on.

Some engineers object to the continuous methods of mixing on the ground that the concrete does not always contain uniform proportions of the various ingredients. Mr. S. B. Newbery stated, in a paper read before the Association of American Cement Manufacturers, that "for the preparation of cement for blocks, in which thorough mixing and use of an exact and uniform proportion of water are necessary, continuous mixing machines are unsuitable, and batch mixers, in which a measured batch of the material is mixed the required time and then discharged, are the only type which will be found effective." This statement must be taken as an individual opinion, and it appears to point rather to inefficiency of the feeding apparatus than to bad mixing. In the author's opinion excellent results can be obtained from continuous mixers provided they are efficiently and continuously fed. If the feeding is done by hand it is necessary to give the materials a preliminary rough turning before shovelling them into the machine.

The most Common Type of Continuous Mixer

is one in which the materials are fed into one end of a long revolving cylinder with internal projections, and the discharge takes place from the other end. At first cylinders without projections were used, but not with much success. One of the first machines employing this means of mixing, but with projections on

the internal surface of the cylinders, was Le Mesurier's, designed for the Birkenhead Docks. It was said to mix about 150 yds. per day, at 4d. per yd.

A modification of this principle is seen in Mason's mixer (Fig. 9). In previous machines in order to cause the materials to travel along the cylinder to the discharge end it was

MASON'S MIXER.

necessary to incline the axis. In Mason's mixer the axis is horizontal and the place of the cylinder is taken by the frustum of a cone, the wider being the discharging end; thus there is always a tendency for the concrete to travel from the narrow or feeding end to the wide or discharging end.

There are a great number of machines in which the mixing apparatus consists of a long revolving box open at each end and inclined towards the delivery end. The shape of this box in cross-section varies. In some it is circular, with shelves as described; in others square, as in one made by the Cockburn Barrow and Machine Co., N.Y. In Weller's machine it has a section somewhat like a cross. The principle is the same in all; and all alike claim that the particular shape adopted has some very special advantages.

There is a type of continuous mixer in which a long cylinder or trough has a spindle revolving inside, carrying arms or paddles arranged round it in the form of a screw. The cylinder or trough is fixed in this case and the material is propelled towards one end by the screw arrangement of the blades, aided sometimes by an inclination of the whole towards the outlet.

The following is a description of

The Huge Cary-Latham Continuous Machine,

designed specially for use on the Newhaven Harbour works and capable of delivering 100 tons of concrete in twenty minutes*: "It consists of two measuring turntables, one for shingle and the other for sand, divided into boxes of the proportionate sizes required. The bottoms of the boxes are hinged so as to drop at a given point in the revolution of the turntable, the hinge-joint being specially contrived to prevent clogging. The cement is also driven, in the required proportion, through a screw-creeper fed from a hopper. All three ingredients are then discharged into a circular pan, from the centre of which radial arms, carrying scrapers, work and level the materials, thus mixing the concrete to a certain extent dry. They also push the mass forward to the delivery chute, where water is added; and the resulting concrete passes to a cylinder, which revolves on outside rollers on a cradle inclined at an angle of 8 degs. to the horizontal. Longitudinal dash-boards are fixed inside the cylinder, and in its revolution the concrete is turned over by them as if by shovels, finally discharging into the vessel moored below it." This machine was driven by a 20-h.p. engine, and was used for making the 100-ton "sack-blocks" used in the harbour works. The cost of a 100-ton block mixed by hand, piece-work, was £5 5s. for labour, but with the above machine the cost of mixing was only £1 15s.

Another excellent machine of the revolving cylinder type for continuous work is the "Ridley." The cylinder revolves upon rollers, and is open at both ends. It is provided with straight or spiral mixing plates

or blades fixed to the internal surface, and is driven from a spur ring encircling the cylinder.

A Point worth noting

about these revolving cylinder machines is that the nature of the aggregate has an influence upon the amount of inclination of the cylinder towards the outlet which is necessary to give a free discharge. A small aggregate requires greater inclination than a coarse, and one containing a large proportion of sand requires a greater inclination of cylinder than one containing little sand.

Sometimes the projections on the inner surface of the cylinder are placed in a sort of spiral to assist the discharge. In the first cylinder machines they were placed in a straight line parallel to the axis of the cylinder. The spiral arrangement is also adopted in Ransome's mixer, to give a better mixing movement to the material.

"Batch" Mixers

usually consists of either (a) a revolving box which takes the charge and churns it about until mixed (Fig. 10); or (b) a fixed box, in

BATCH MIXERS.

which are placed one or more revolving spindles carrying arms or paddles (Fig. 11 and 12).

The revolving box type may take an infinite number of forms. The Lee mixer consists of a cylinder through which a spindle passes in a rather remarkable way. It enters through the side, near one end, and passes out through the opposite side, near the other end. The revolution of the cylinder, after it has received its charge through a door for the purpose, tosses the materials about inside, and so mixes them.

Other Types.

Another form of mixing vessel is the "cubical"; the spindle passes along one of the diagonals of the cube and causes the box to revolve, mixing as before. This machine is made in two forms by the United Concrete Machinery Co. In one the cube is filled from the top through a hopper in the staging supporting it, a door being provided to take the charge. In the other machine the vessel is fed at one of the corners through a large pipe and trunnion, the emptying taking place through a door provided for the purpose.

* A paper read before the Civil and Mechanical Engineers' Society on December 7th, 1905.

* Min. Proc. Inst. C.E., vol. lxxvii.

TAYLOR'S MIXER.

Another type has a cylindrical vessel revolving on its axis, and provided with steel projections from its inner surface, which carry up the material, like shelves, and discharge it before reaching the top of the cylinder. The Ransome Concrete Machinery Co. make a machine of this type.

Taylor's Mixer

is a batch machine of the revolving vessel type (see Figs. 13 and 14). The mixing chamber is shaped somewhat like two hollow cones placed base to base, with the axis of revolution passing through their apices. A spindle or trunnion projects from one apex and is supported by a bearing; through this trunnion water is admitted by a pipe. The other apex is cut off or truncated to form a circular opening, round which is fixed a roller path supported by and revolving upon rollers. The axis of revolution is horizontal. The materials are fed from a hopper through the above opening, and discharged when mixed through a series of doors round one of the cones near its base. These doors can be opened or closed while the machine is in motion by means of levers actuated from a collar sliding upon the trunnion.

Another form of the Taylor machine (Fig. 15) has a different arrangement for discharging. An opening is provided at the opposite apex from the feed. The vessel is supported and revolves in a frame, which latter is supported by a pair of horizontal trunnions at right angles to the axis of rotation. By this means the vessel can be tilted so as to discharge its contents. This is a great improvement upon the one previously described, as you can see into the vessel and gauge the water and time of mixing.

The following is the actual time of three operations of the machine. —

Secs.	Secs.	Secs.	
0	0	0	Hopper opens and empties into mixer.
60	60	60	All material in mixing cone.
105	90	90	Concrete properly mixed.
115	95	100	Cone turns over so as to empty.
140	120	140	Cone back in position, ready for filling.

The capacity is about 10 to 24 cub. yds. per hour, twenty to twenty-seven batches being mixed in that time.

The "Gauhe" is another of the closed vessel mixers, having a revolving drum for mixing and an arrangement of feed hopper and discharging doors. The capacity may be anything from 4 to 40 cub. yds. per hour, according to the size.

"Messent's Closed Mixer"

is a batch machine. The charge is fed into an irregular-shaped vessel revolving on an axle. The shape of the vessel is such as to thoroughly mix the material after a few revolutions. An interesting development of this mixer is a machine designed by Mr. A. H. Owles, M.I.C.E., and used on the Dover Harbour Works. It is thus described by Mr. Appleby in his "Handbook of Machinery." "The mixing vessel, the capacity of which is 1 cub. yd., is of the well-known 'Messent' type. It is mounted on a strong steel-frame carriage provided with two electric motors, one of which revolves the mixing vessel whilst the other gives a travelling motion to the carriage, so that the operations of mixing and travelling can be performed simultaneously. The proper charges of material are fed into the mixer from hoppers, and the charging door is closed; the machine is then travelled to and over the block mould, the mixing vessel being meanwhile rotated by the motor provided for that purpose. The number of revolutions are indicated by a dial . . . and when about fifteen revolutions are registered . . . the mixer motor is stopped . . . the mixed concrete discharged, and the machine returned for another charge."

A Curious Machine

is described in the "Engineering News" of September 6th, 1900, as follows: "Instead of using steam power to churn the concrete in a box, like the common mixer, the box or drum is placed on wheels and is so connected to them as to slowly revolve while a horse is drawing it from the place where the ingredients are piled to the place where the concrete is to be used . . . The capacity of the

drum is 21.6 cub. ft. or 0.8 cub. yds., and it is designed to hold sufficient ingredients to make half a cubic yard of rammed concrete in place. The ingredients shovelled in separately will nearly fill the drum, but they shrink rapidly as the cart moves off, and they become incorporated with each other.

"At the point where it is desired to dump, the driver raises a lever and releases an unlatching bar, which opens the latch holding the two halves of the drum together, and it at once dumps its contents and at the same time automatically goes out of gear." This machine is the invention of Mr. Isaac H. Fisher, and can be drawn by one horse. It has been christened the "Dromedary," owing to the open half of the drum resembling a hump.

Fawcett's and Oehler's Machines.

The type of batch mixer having a fixed vessel to contain the concrete, and revolving paddles to mix it, is well represented by Fawcett's machine and Oehler's (a Swiss make).

The former mixer has a drum of a peculiar shape which contains two parallel spindles (as in Figs. 11 and 12), each carrying three sets of arms or paddles. There are four arms in each set, and the spindles revolve in opposite directions, an arm on one spindle coming into the space between two arms on the other. This arrangement gives as thorough a mixing as it is possible to obtain; and when the delivery door is open the movement of these arms clears out the drum of all concrete, as the flukes on the ends are designed to scrape clean the whole surface from side to side as they revolve. The remarkable kneading and mixing which this machine gives the materials in the drum makes it one of the best for reinforced-concrete work, in which the quality of the concrete surrounding the steel must be specially good.

In the Oehler machine the mixing mechanism consists of a single spindle having arms and flukes much the same as the last. But the arrangement for emptying the drum is different. In this case the whole drum, which is open above, turns upside

FIG. 15.—MIXER OF TAYLOR FORM.

GRAVITY MIXERS.

down, and, as before, the flukes of the revolving arms scrape it clean. The general design of the Oehler mixer is practically the same as Fawcett's, but with the two important differences just mentioned.

Arthur Koppel's Machine

(illustrated in connection with the first part of this article, Figs. 4 and 5) is another excellent type of batch mixer. In this the materials are fed into a revolving drum with a special arrangement of paddles and scraper. A very neat arrangement of single-bucket elevator gauges the ballast, and the water is measured in a tank by a ball tap.

Gravity Mixers.

There now remains only the class of machine known as "gravity" mixers. These are mixers pure and simple.

As the name implies, they work by the force of gravitation and consist of means whereby the materials in falling through a certain height have their ingredients thoroughly incorporated together.

The first of these machines was invented by Jackson and patented in 1882. It consists (Fig. 16) of a chute provided at the upper end with a hopper and at the lower with a contracted outlet. "The main trunk or chute has in its interior shelves which incline downwards and project alternately from opposite sides of the interior of the said trunk or chute, and are so situated relatively the one with the other that when the materials to be mixed are thrown into the hopper they fall down the first inclined shelf and therefrom on to the next inclined shelf, and so on from shelf to shelf until they pass from the open bottom."* Water may be admitted in a spray near the top of the chute.

The idea of this mixer is very simple, but there are certain drawbacks inseparable from the arrangement. By a series of experiments the author has found it to be impossible by shelves alone to obtain a practicable mixer suitable for all kinds of material. The mere action of directing a stream of materials from shelf to shelf does not necessarily mix if the complete stream is diverted as in this machine; and it has also been found that if the shelves are inclined at an angle sufficient to ensure throwing the stream from shelf to shelf, the adhesion of the ballast and cement prevents its slipping off, and so the apparatus clogs. On the other hand, if the inclination

is sufficient—and it must not be more than about 25 degs. to the vertical—the materials slip off the shelves but the apparatus does not mix. Further, the inclination necessary for one kind of aggregate is not the same as for another. The finer the particles and the more sand contained the greater is the tendency to clog.

Messrs. Mason Brothers, of Leicester, attempted to get over the latter difficulty by having the shelves hinged and the inclination capable of being altered. But the other dilemma remains.

In 1885 Stockman invented a gravity mixer (Fig 17) consisting of a series of superimposed cones and funnels in a chute, the funnels dropping the materials on to the points of the cones. The inclination difficulty remained the same in this as in the chutes with shelves, and, as a matter of fact, both Jackson's and Stockman's patents were allowed to become void.

There is an American mixer in which a series of round pins are arranged in a "staggered" pattern down the chute. The pins pass from front to back, and are arranged in horizontal rows one above the other, the pins of one row under the spaces of the row above. On throwing materials into the hopper provided at the top they are mixed by these pins in falling. Unlike the mixers previously mentioned, which hang vertically, this must be worked on a slope.

The great difficulty in such mixers is the efficient wetting of the concrete. They appear to mix dry materials fairly well, but there is a tendency for the water, which is admitted near the top, to run down the back of the chute in a stream separate from the ingredients of the concrete. A box, therefore, is provided in some near the bottom, into which the concrete falls and is allowed to soak for a short time with the water.

This mixing with the water has always been a serious difficulty in gravity mixers.

Dr. Owens' Machine.

In the author's machine certain new principles are introduced (see Fig. 18). The chute is the same as before, but all the bafflers or inclined surfaces are placed at a very steep slope to ensure the materials sliding off, and there is no complete diversion of the materials. Provision is also made to ensure a proper wetting of the concrete and prevent the water running down as a separate stream. This object is attained as follows:—

The water is forced to follow either a central path, in a spray, down the mixer, there mingling with the concrete, or to spread in a thin film over the working surfaces, upon which the particles of dry materials fall and become wetted.

The mixer consists of a chute, with large baffle plates on alternate sides, as in Jackson's, but fixed at about 25 degs. to the vertical. A series of sinuous bars or springs pass down the centre of the chute, spaced at equal intervals apart. They are bent in a zigzag way to perforate the free edges of each large baffle plate. These springs are formed of thin bars about 2ins. by $\frac{3}{8}$ or $2\frac{1}{2}$ ins. by $\frac{3}{16}$, and are so twisted—in addition to the bending above mentioned—as to deflect the material in opposite directions as it falls from each large plate. Water is admitted in a spray behind the top plate, and thence follows three separate paths—

- (1) down the sinuous bars in a film,
- (2) from one large plate to the next below it,
- (3) in a spray with the materials as they fall down the chute.

The chute hangs vertically, and the sinuous bars split the materials into columns. One of each pair of columns falls between these bars, in the spaces; and the other column strikes the inclined surface of the bars or springs, and is deflected into the one falling in the space. This is what is referred to as a partial deflection. The process is repeated where the narrow bars pierce the free edge of each large plate. It also takes place to some extent from the large plates themselves, which do not project far enough into the chute to cause a total deflection.

The action of this mixer is very satisfactory. As in all gravity mixers, it is best to give the materials a rough turning before feeding into the hopper. When feeding begins the water is turned on and a steady stream of materials shovelled into the chute. The amount of water is easily regulated.

For work below ground level, where it is not necessary to lift your materials up before letting them fall, this machine is especially useful. When fed properly it turns out from 80 to 120 yds. per day, and as no power is used it is very economical. Several machines are at present in successful use. They are being made by Messrs. Arthur Koppel.

To attempt a thorough description of all the concrete mixers in use would require too much space. The author can therefore only hope that the members of this Society will deal leniently with his attempt to give even this imperfect account of the processes involved in producing a good concrete. The subject is a large one and growing in dimensions day by day as the advantages of concrete either plain or reinforced are becoming more and more widely recognized.

The author begs to acknowledge his indebtedness to Mr. A. E. Carey, M.I.C.E., Messrs. J. H. Wilson & Co., Messrs. Arthur Koppel and Orenstein & Koppel, Mr. Henry Puplett, M.S.E., Mr. E. N. Trump, Syracuse, N.Y., Messrs. the Ransome Concrete Machinery Co., N.Y., the National Concrete Machinery, Chicago, and the Link-Belt Engineering Co., Philadelphia, for their kindness in supplying him with drawings, photographs and particulars relative to their respective machines for the purpose of preparing this paper.

Liverpool Architectural Society.—Last week's meeting of this Society was given up to a further discussion of Mr. T. T. Rees's paper on "The Improvement of our Cities." Mr. T. Myddelton Shallcross opened the discussion, and was followed by Mr. Hastwell Grayson, Mr. Rathbone, Professor Riley, Mr. H. B. Bare, Mr. P. C. Thicknesse and others. Resolutions were passed that the city of Liverpool should be worthy of its commercial greatness and should express its dignity, which was only to be done by the combined efforts of worthy citizens. "It therefore suggests to the Council of this city the advisability of having a committee to deliberate as to the best means of attaining that end."

* Jackson's specification, 172, 1882.

CROMPTON LIBRARY COMPETITION.

THE Crompton Urban District Council of Shaw (adjoining the borough of Oldham) having been offered £3,000 by Mr. Carnegie for a library, have just concluded the final stage of a very successful competition. Forty-six designs were submitted, the majority from Lancashire, several from London, and others from Belfast, Newcastle, Coventry, Gosport and other towns. Mr. G. H. Willoughby, F.R.I.B.A., a most experienced assessor, adjudicated on the designs. His award was announced in our columns two week ago. The total outlay on the library, to include everything except furniture, was limited to the £3,000.

Mr. Jesse Horsfall, F.R.I.B.A., of Manchester, gained the first premium of £30. He sent in two separate designs, rough plans of which are given below.

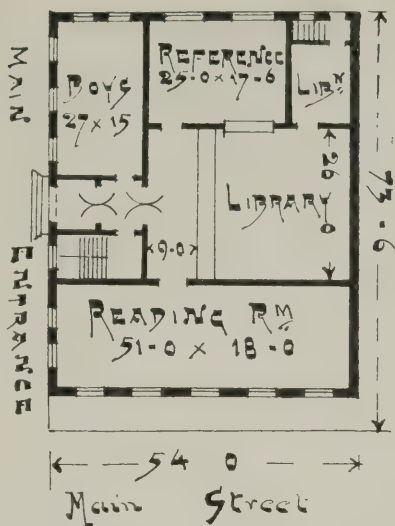

SELECTED PLAN, BY JESSE HORSFALL, F.R.I.B.A.

ALTERNATIVE PLAN BY JESSE HORSFALL, F.R.I.B.A.

The one with the octagon hall has been selected for erection, and it will, no doubt, be generally admitted by those who inspected the designs when on exhibition that it has well merited the place of honour. A vestibule about 9ft. wide, with an entrance in the centre of the main elevation, opens to an octagon hall with an octagon dome light. On the right-hand side, most conveniently planned, is the lending counter; on one side, facing the front, is the boys' reading-room, 21ft. by 18ft., with two tables and benches; and on the other side the reference library. Leading from the octagon hall is a staircase of two flights, one down to a men's lavatory in the basement, and the other up to a ladies' reading-room (20ft. by 16ft.) on the first floor, with a lavatory adjoining. The general newsroom adjoins the side street and is well

PLAN PLACED SECOND, BY A. E. DIXON, A.R.I.B.A., AND CHARLES H. POTTER.

lighted. It contains four reading tables accommodating thirty-two readers, and two stands for sixteen newspapers. The lending library facing it has a skylight over and contains two ranges of bookshelves placed at right angles to one another. The librarian's room, with a small fireplace, is lighted by windows from the back street, the staff entrance and stairs to basement being close by. In the basement are the heating chamber, staff lavatory and workroom. The elevation is Italian in feeling, designed to be erected without great expense. The central entrance is square-headed, with radiating key and arch stones. On either side is a small circular window, and above, under a gable, a three-light window into the ladies' reading-room. At each corner are stone quoins. The side elevation has a bold gable accentuating the staircase.

Mr. Horsfall's alternative design shows all the public rooms on the ground floor. The elevations are artistically designed in Gothic with mullioned windows. The front elevation has two gables and a side range of three-light windows. If this elevation could be applied to the other plan a most successful library building would be the result.

Mr. A. E. Dixon, A.R.I.B.A., and Mr. Charles H. Potter, both of Manchester, gained the second premium of £20. They selected the less important street for their main entrance, which opens into the lending library and public counter. The boys' reading-room is placed on one side and the public reading-room on the other. The reference library and librarian's room are well placed. The ladies' reading-room is above, approached by a staircase placed close to the entrance.

Another Manchester architect, Mr. Thomas J. Hill, was awarded the third premium of £15, while the fourth (£10) was gained by Messrs. J. Eaton, Sons & Cantrell, of Ashton, Lancs.

Three good designs were sent in by London architects—one by Mr. E. W. Poley with a central corridor and an octagon hall, very similar to the first-premiated plan, with all the public rooms placed on the ground floor; another by Messrs. Fair & Meyer, who, however, unfortunately forgot that in the North of England the librarian's room must overlook the library, having placed his room above, and so rendered their effort futile; and the third by Mr. J. A. Minty.

A very clever plan and design came from Belfast, by Mr. E. Sharp Hill, and another good plan was that by Mr. H. Lord, of Manchester (here shown).

Mr. T. B. Walters, of Coventry, was one of those who placed his entrance in the side street. He arranged the lending library on

PLAN BY H. LORD, F.R.I.B.A.

the ground floor and the reference library over it. In a large building with a numerous staff that may be desirable, but for a small Lancashire town it is a defective arrangement; otherwise the plan was an excellent one.

Messrs. Walker, Carter & Walker, of Windermere, sent a plan with a large first floor occupying the whole length on the main street. Their elevations were extremely successful. Two very well-studied designs came from Messrs. Hope & Son, of Bradford, and from Messrs. Crouch & Butler, of Birmingham, and others from Mr. E. Cratney, of Willington-on-Tyne, and Mr. S. M. Mould, of Newcastle, with an octagon hall.

One of the best plans in the room was that submitted by Mr. W. Norman Twist, of Birmingham, the entrance being arranged in the side street, with lavatories on each side and the library counter in front.

Altogether the designs submitted were very competent.

DRAWINGS OF ANCIENT ARCHITECTURE.

Proposed National Collection.

TWO or three weeks ago we published a note stating that the Spiers Testimonial Committee had handed over to Mr. R. Phené Spiers the sum of £79, being the balance in hand of the fund after paying the costs of the medallion, presentation of books, dinner to Mr. Spiers, and the publication of his volume of essays "Architecture, East and West." We now understand that Mr. Spiers proposes to hand over this sum to a small committee consisting of himself, Professor Lethaby and Mr. R. Weir Schultz, to deal with as the nucleus of a fund (to be added to by subscription or otherwise) for the purpose of forming a collection of drawings of ancient architecture in continuation of the work of the Spiers Testimonial Committee, such drawings to be deposited at the South Kensington Art Library or at the British Museum, and to be available for access by students of every kind. The committee now invite architects and others who possess such drawings to place them at their disposal for this purpose. They will also be glad to receive any information as to the existence of such drawings or of sketch-books or other material of a similar kind. Photographs of buildings which no longer exist, or which have been materially altered, will also be received for the collection. Communications in reference to the matter should be addressed to Mr. R. Phené Spiers, 21, Bernard Street, Russell Square, W.C.

NOTES ON COMPETITIONS.

The following is a list of competitions open:—

DATE OF DELIVERY.	COMPETITION.
March 1	NEW COLLEGE BUILDINGS AT BANGOR (Names only).—Particulars from Mr. J. E. Lloyd, Secretary, University College of North Wales, Bangor.
" 5	NEW COUNCIL OFFICES FOR HOLBORN.—Names only (from which a selection will be made by the Committee) to Mr. Lionel Walford, Town Clerk, 197, High Holborn, W.C.
" 5	HOSPITAL AT LEUCHARS.—Particulars from Mr. J. L. Macpherson, clerk to Hospital Committee, St. Andrew's, Fife.
" 12	SCHOOL AT GREENOCK.—Premiums of £42 and £31 10s. for designs placed second and third. Particulars from Mr. A. F. Niven, Municipal Buildings, Greenock.
" 17	LIBRARY AT PEEL (I.M.).—To cost £500. Single premium of £10. Limited to architects in the Isle of Man. Particulars from Mr. George Cannell, Town Clerk, Douglas.
" 20	FREE LIBRARY AT BANGOR.—Premiums of £25 and £15. £1 is deposit for conditions. Particulars from Mr. W. H. Worral, Municipal Offices, Bangor, North Wales.
" 24	FREE LIBRARY AT SWADLINCOTE.—Premiums of £25, £15 and £10. Particulars from Mr. W. A. Mussion, Clerk, Council Offices, Swadlincote.
" 31	BIRMINGHAM COUNCIL HOUSE EXTENSION (Sketch Plans).—£1 is deposit for conditions. Particulars from Birmingham Town Clerk, Council House.
April 2	PUBLIC LIBRARY AT SOUTHWARK (to cost £7,000).—Premiums of £50, £30 and £20. £1 is deposit for conditions. Particulars from Mr. J. A. Johnson, Town Clerk, Town Hall, Walworth Road, S.E.
May 31	NATIONAL CONGRESS HALL FOR BRAZIL.—Premiums of 15,000, 10,000 and 5,000 milreis (equivalent to about £1,685, £1,125 and £562 respectively). 5,000 milreis also for designs not premiated but desirable to be acquired. The conditions of the competition can be seen at the offices of the Commercial Intelligence Branch of the Board of Trade at 73, Basinghall Street, E.C.
No date	ISOLATION HOSPITAL AT STONE.—Limited to architects in the district. Particulars from Mr. J. J. Chapman, clerk to the Stone Joint Hospital Board, Stone, Staffs.

Central Public Library, St. Pancras.

There is consternation in St. Pancras over the proposed public library. On the one hand are the economists who are alarmed at what they regard as the too progressive tendencies of the borough council, an alarm which has been augmented apparently by a councillor's remark that theirs was to be the finest library in London. On the other hand are those persons who consider that architect ratepayers practising in the borough should have, at the least, a chance of competing for a building the cost of which they will be called upon to bear a share. This latter section is headed by Mr. Inglis, a local architect, who is conducting a very active campaign to secure an open competition. It will be remembered that at the request of the borough council Mr. Belcher, president R.I.B.A., nominated six architects whose names were accepted for a competition limited to that number, each competitor to receive an honorarium of £40. Mr. Inglis contends that this is great extravagance and that a considerable amount of ratepayers' money might be saved by an open competition with premiums of £100, £50 and £25, the first premium to merge in the commission payable to the successful competitor. Groaning is a relief to a sufferer, even when suffering is borne with the knowledge that it is but an inevitable means towards ultimate good. This simile may be applied to ratepayers and public libraries. Assuming that libraries are a benefit to the community, there yet remains the inconvenience of paying for them, and the person who does not groan when this stage of affairs is reached is a *rara avis* indeed, no matter how advanced

his principles may be. So there is excuse, if not reason, for the fears of the St. Pancras economists, but with the action of the architect who desires an open competition it is impossible to sympathize. The profession is divided in its views as to whether competitions are an advantage or otherwise, and much argument has been adduced on both sides. However divergent opinion has been upon the principle of the matter, there has been no question as to the superiority of the method of paying a limited number of competitors something for their trouble, over the other method so wasteful in labour where much is done for little. St. Pancras having decided to possess a library, it was the duty of the council to take steps to obtain for those it represents the best building possible in the circumstances. This it appears to have done, and it has moreover shown evidence of an intention to deal fairly with an overworked profession by offering some sort of remuneration for the valuable designs which will be at its disposal to select from. Mr. Inglis not only intends to prevent this if he can, but he desires in his cheese-paring open competition scheme to rob the successful competitor of a well-earned premium; and all to save a paltry sum of £165—paltry indeed when compared with the probable cost of the building, i.e., £20,000. It is evident the council was not aware that there were architects in St. Pancras capable of producing free libraries, for if it had been there is no doubt it might have acted differently. As it is, the Council has committed itself to a certain course of action, and in view of this fact it is a matter for deep regret that anyone calling himself an architect should be guilty of an endeavour to wrest honour and commission from six highly capable fellow-practitioners who have had the good or bad fortune to be selected to occupy a position the which has been attained without any previous solicitation on their own part. Such conduct can only be stigmatised as undignified, unprofessional and savouring of the dog in the manger.

Building for the National Congress of Brazil.

It is not likely that this competition will be much sought after in this country. It is curiously described in the Board of Trade Journal as "a competition for the presentation of plans for the construction of a building for the National Congress of Brazil." It is further stated that "projects destined to compete will be received in the secretarial department of the Federal Senate up to 4 p.m. on the 31st May next." Prizes of 15,000, 10,000 and 5,000 milreis are offered to the authors of the three best plans presented to the judges, and a further sum of 5,000 milreis is to be expended in acquiring the plans which the judging committee regards as the most deserving of being acquired for the National Congress. If anybody considers these particulars alluring, they may obtain further information at the offices of the Commercial Intelligence branch of the Board of Trade, 73, Basinghall Street, London, E.C.

Saxon Snell Essay Prize.

This prize, the outcome of a legacy by the late Mr. Henry Saxon Snell, F.R.I.B.A., is to be awarded by the council of the Royal Sanitary Institute at intervals of three years. The subject for 1906 is: "Suggestions for improvements in sanitary appliances for use in workmen's dwellings and labourers' cottages under the varying conditions of water-supply and drainage usually obtaining in towns and villages." The prize is of £50; together with a medal of the Royal Sanitary Institute. The essay is to be of not more than 5,000 words and must be delivered before 4 p.m. on September 30th next, addressed to the Secretary, Royal Sanitary Institute, 72, Margaret Street, W. Two com-

petitors of different professions or crafts may join in sending an essay and plans.

Secondary School for Girls at Liverpool.

At last Thursday's meeting of the Liverpool Education Committee considerable discussion took place in regard to a competition for the new secondary school for girls which is proposed to be built on a site in Aigburth Vale, to accommodate about 300 girls, with a junior department for about 100 scholars. The sites and building sub-committee recommended that the competition should be limited to architects in Lancashire and Cheshire, with premiums of £50, £30 and £20, and this recommendation was ultimately adopted.

Carnegie Library, Southwark.

The committee of the Competition Reform Society disapproves of the conditions in the above competition because the designs are to be assessed by a committee of councillors and the borough surveyor. Members are requested to abstain from competing unless the conditions are satisfactorily revised.

A Leeds Sunday School.

The trustees of Holdforth Street Chapel, New Wortley Leeds, having decided to build a new Sunday school adjoining the chapel, architects were invited to submit competitive designs. The assessor (Mr. C. H. Channon, of Malton) has placed first the design submitted by Messrs. T. A. Buttery and S. B. Birds, of Leeds and Morley, and the trustees have accepted his award and instructed the architects to proceed with the building.

Obituary.

Mr. William Barratt, builder, of Bowes Park, N., poisoned himself recently.

Mr. J. T. Gresty, builder, of Willaston, Nantwich, died last week in his sixtieth year.

Mr. Ernest Godman, architect, died last week at Banstead, Surrey. For many years he had been associated with Mr. C. R. Ashbee, at Chelsea, and with the Guild of Handicraft, now removed to Campden, Glos. He was also the secretary of the Committee for the Survey of the Memorials of Greater London. Quite recently we reviewed his book on "Mediæval Architecture in Essex," and we now have before us his later book on "Norman Architecture in Essex." Mr. Godman was only 30 years of age.

Mr. J. E. Tuit, a director of Sir William Arrol & Co., died last week, aged 46. He was discovered by Sir William Arrol on the Forth Bridge work, and was assistant to Sir John Fowler and Sir Benjamin Baker on that great undertaking. He was responsible for the design of the staging and other temporary works which enabled the workmen to carry out their difficult operations on the great high projecting members of the giant cantilevers; indeed, it is not too much to say that it was Mr. Tuit's mathematical ability in determining wind-pressures and stresses, and in devising the above, in association with the practical experience and judgment of Sir William Arrol and Mr. A. S. Biggart, that made the Forth Bridge an accomplished proof of the ingenuity and genius of Sir John Fowler and Sir Benjamin Baker. Mr. Tuit, on the completion of the Forth Bridge, came to London, and was in sole charge of the erection of the Tower Bridge for Sir William Arrol & Co. Later he was occupied on various work for his firm, and some of the finest roofs in Clyde shipbuilding and engineering works were designed by him. His latest great bridge work was the structure across the Nile at Cairo, now being erected. The design prepared by him for this bridge, nearly two miles long, was accepted in international competition.

Notes and News.

A new Bison House at the Zoo is being erected, adjoining the deer house. Work on the new otters' pond is well in hand.

Cost of erecting Elementary Schools.—A committee of the London County Council is to submit a full report on this subject.

"A Chat about Architects and Architecture."—In our issue for last week we stated that the new edition of the above booklet had already been published. The author (Mr. W. I. Chambers) informs us that this is not the case, the date fixed for publication being May 1st.

Messrs. Joseph Kaye & Sons, Ltd., of Leeds, have received an order from the Admiralty for 8,100 of their patent seamless serrated oil feeders, also a similar number of their patent seamless spouts, to be delivered to H.M. naval establishments as may be required. This order is part of a contract which is to extend over the next three years.

The late Mr. Saxon Snell's Bequest.—At next Monday's special general meeting of the Royal Institute of British Architects Mr. A. Saxon Snell will call attention to the terms of the bequest by his father, the late Mr. Henry Saxon Snell, and will ask what steps have been taken by the Council to formulate a scheme for the proposed scholarship or prize.

A Complimentary Dinner to Professor Henry Adams, M.I.C.E., M.I.M.E., F.S.I., F.R.S.I., was given last week at the Holborn Restaurant by students of the City of London College who had worked under his direction while he was there as professor of engineering, which position he held for thirty-five years. Professor Adams was presented with an illuminated album and a gold chain.

The 23rd Annual Congress of The Royal Sanitary Institute will be held at Bristol from July 9th to 14th next. Sir Edward Fry will preside, and the following will act as presidents of sections 1, 2 and 3 respectively:—Section 1, "Sanitary Science and Preventive Medicine," Sir William J. Collins, M.D.; section 2, "Engineering and Architecture," Mr. Edwin T. Hall, V.-P.R.I.B.A.; section 3, "Physics, Chemistry and Biology," Mr. W. N. Shaw, M.A., D.Sc., F.R.S.

The new Carlton Hotel at Johannesburg, just opened, has been entirely built and equipped by Messrs. Waring & Gillow, and when it is realized that everything except the stone employed in the construction had to be shipped from England, the magnitude of the work will be evident. The building is of six storeys and has a frontage of 620ft. There are more than 200 bedrooms. The accommodation includes a rotunda in the Charles II. style, a Louis XVI. palm court, a ballroom or restaurant with modelled ceiling and galleries at the ends, a public dining-room, billiard-room, Adam drawing-room, ladies' writing-room, grill-room and smoking-room. Turkish baths are also provided.

Craigmillar Asylum, Edinburgh, is to be reconstructed according to plans prepared by Messrs. Henry & Maclellan, architects, of Edinburgh. A new upper storey is to be erected in place of the present roof storey, and a new top storey added. On this top floor the kitchen offices (now in the basement) will be located, together with additional dormitories and servants' accommodation. The present dining hall is to be considerably lengthened, and the laundry and washhouse (at present in an outside building) placed in the basement under the dining hall. Various alterations will be made on the other floors, and the whole of the lavatory and bathroom accommodation will be remodelled and brought up to date. The cost of the work contemplated will be about £15,000.

For the Grand Hotel, Worthing, the design of Messrs. Mitchell & Raine, architects, of London, has been accepted.

An Office Tower Forty Storeys High, reaching to a height of 594ft., is to be built in New York at a cost of £300,000. Mr. Ernest Flagg is the architect. The highest skyscraper at present in New York is in Park Row, comprising twenty-nine storeys, 382ft. high.

The Annual Dinner of the Surveyors' Institution was held last Wednesday. The president, Mr. Charles Bidwell, said that the membership of the institution was rapidly approaching 4,000, and the entries for the examinations for this year were 700. Scholarships for students had been instituted at Cambridge, at the University of North Wales, and at the Armstrong College, respectively of the values of £80, £50 and £50 per annum, tenable for three years.

"Modern Buildings: their Planning, Construction and Equipment."—Vol. I. of this new work (edited by Mr. G. A. T. Middleton, A.R.I.B.A., assisted by numerous special contributors) has just been issued by the Caxton Publishing Co., 84-86, Chancery Lane, W.C., price 10s. 6d. nett. It deals with "Office Practice and Draughtsmanship," "Cottages and Country Houses" and "The Construction of a Building's Shell," and is very fully illustrated, some of the reproductions being in colour. We shall review the volume in our next issue.

The Mutilation of Sculpture is a vogue of to-day, said Mr. W. R. Colton, A.R.A., last week in his second and concluding lecture at the Royal Academy. Apparently, to lop off a leg or two legs, or an arm and a leg, greatly enhanced the artistic value of sculpture. Well, it certainly had one quality—it left more to the imagination. One genius had even gone farther and split off a piece of a face. This was not a joke; it appeared in a recent exhibition of high class, where a considerable proportion of the sculpture was more or less mutilated. "But seriously," said Mr. Colton, "is not this the hypocrisy of art—a juggle to deceive the observer? Sculpture should not lend itself to the absurd or grotesque; it should be the expression of an idea." Mr. Colton spoke of the fountain as perhaps the finest expression of decorative sculpture. He instanced a number of examples, among them being two at Versailles, several in Rome, and others at the Alhambra, Pompeii, Cambridge and Lyons. Dalou's Paris fountain, "The Triumph of the Republic," was also illustrated.

The Teaching of Mathematics to Building Workmen.—Mr. Harold Busbridge, A.R.I.B.A., chief lecturer in building subjects at the L.C.C. Technical Institute at Paddington, dealt with this subject in a paper which he read before the recent meeting of the Association of Teachers in Technical Institutes at the Regent Street Polytechnic. In considering the requirements of evening students, Mr. Busbridge held that the part which mathematics played in the training of builders' workmen was a very limited one. For this reason he thought that the Board of Education syllabus in practical mathematics, admirable as it might be for the engineer, was nevertheless quite unsuited to the needs of workmen. An average student who patiently plodded through the whole prescribed course would never be likely to make effective use of one-half of what he had learned—in fact, he would probably not retain more than one-tenth as a working modicum—and the time he had been spending in acquiring some degree of proficiency in the use of logarithms, trigonometrical formulæ, &c., would in nine cases out of ten have been far better spent on other subjects bearing more directly upon his work or upon some useful artistic training, in which most workmen were so lamentably deficient.

THE ARCHITECTURAL ASSOCIATION.

A SPECIAL general meeting of the Architectural Association was held at 18, Tufton Street, Westminster, on Friday night (Mr. E. Guy Dawber, F.R.I.B.A., president, in the chair) to consider a proposal of the Council to add the words "Editor of the A.A. Journal" after the word "librarian" in by-laws 21 and 30, and to substitute "nine ordinary members" in by-laws 21 in place of ten. The Council felt that the Editor should be ballotted for annually, as in the case of other officers, and that he should be an ex-officio member of the Council. This would still bring the total of the Council to seventeen members as before. The proposal was unanimously agreed to.

The ordinary meeting followed, when the following new members were elected:—Messrs. A. D. Leroy, J. A. Mettham, D. Kibbler, E. S. Coldwell, H. Cyril Chatfield Clarke, J. E. Lee, F. G. Geary, C. W. Ferrier and G. E. G. Leith.

The re-instatement of Mr. C. L. Fleming-Williams was announced; also the following further donations to the Building Fund:—

Mr. Frank T. Baggallay, F.R.I.B.A., then read a paper on "Porches and Approaches." Our report of it is held over till next week, by reason of the great pressure on our space.

Law Cases.

Guards on Moulding Machines.—At the Loughston County Court last week an apprentice machinist named Wood claimed damages under the Employers' Liability Act, 1880, from Messrs. Young & Son, builders, of Longton, for the loss of his thumb on July 5th, 1905, while working a spindle moulding machine belonging to the defendants, which, it was alleged, was not provided with a proper and efficient guard. Wood said he had to rebate about 100 strips of oak, about ½ in. thick and 2½ ins. wide; he had to push the strips along the table of the machine in front of a spindle making 3,000 revolutions a minute. He was pushing one strip along when, in consequence of the curly or knotty nature of the wood, it kicked back, and his left hand slipped on to the knives, cutting off his thumb. On behalf of the plaintiff it was stated that the machine was regarded by the trade as "most dangerous," so much so that in 1902 the Operatives' Society sent out a circular asking for better fencing. In many places a better protective guard had been adopted, and it was contended that if such a contrivance had been in use on this machine Wood's accident could not have happened.—The judge asked why the case had not been brought under the Workmen's Compensation Act, remarking that he did not want two actions to arise out of the matter.—Mr. Brough, for the defendants, said that 7s. 10d. weekly had been allowed under the Workmen's Compensation Act until last November, when it was refused; the defendants were then told the matter was to be proceeded with under the Employers' Liability Act.—The judge said that Wood, having received half wages, was indemnified up to the present, and all his Honour had to consider was how the accident affected plaintiff's future. Undoubtedly he was a less competent workman, but after all not so much. He therefore should name £40 as compensation and £10 in addition for costs.—It was agreed that the action under the Employers' Liability Act should be withdrawn, and a memorandum filed under the Workmen's Compensation Act.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Stability of Church Roof.

Roof writes: "I send drawing showing proposed framing of roof of nave for a new church 24ft. wide, with transept 19ft. wide. Are the sizes of timbers suitable for the span, and are the walls and buttresses sufficient to resist the thrust of the roof? I should also like to know the best method of constructing the roof of nave and transept where they intersect to form the valley shown on plan."

The scantlings of the roof trusses will probably be sufficient if the buttresses are made of the dimensions shown in elevation (Fig. 1) and plan (Fig. 2). The vertical dead load from one-half of the roof truss, amounting to 94.5 cwt., is assumed as acting on the wall-plate $4\frac{1}{2}$ ins. from the inner edge of the wall, and this is combined with the whole of the wind-pressure on the roof, amounting to 63 cwt., acting in a direction normal to the slope of the roof-surface and striking the opposite wall where shown on Fig. 1. The result is then combined with the weight of the wall and buttress acting at their mutual centre of gravity, the length of wall being taken as between assumed window openings, the positions and sizes of which are not stated. Having obtained the final resultant, the maximum stress per square foot

will be found by the formula $\frac{W}{A} \pm \frac{M}{Z}$, where

W = vertical component of resultant, A = sectional area of wall and buttress in square feet, M = bending moment, and Z = modulus of section. Then $\frac{404}{17'15} \pm \frac{404 \times 1'43}{9'4} = 23'55$

$\pm 61'5$ = say 85 cwt. = 4.25 tons per sq. ft. maximum compression on material of buttress. For the framing of roof timbers at the junction of the nave and transept roofs the arrangement will be as shown by dotted lines on plan (Fig. 3), section along ridge of nave (Fig. 4) and cross-section of nave (Fig. 5). The ridge of transepts may be continued right through, and short principal rafters from the ridge of the nave carried down and halved to it. The valley rafters, into which the ends of purlins are framed, should not be less than 11 ins. by 7 ins., and they should have their ends firmly secured to the junction of the transept ridge and short principal rafters.

HENRY ADAMS.

Damp Walls.

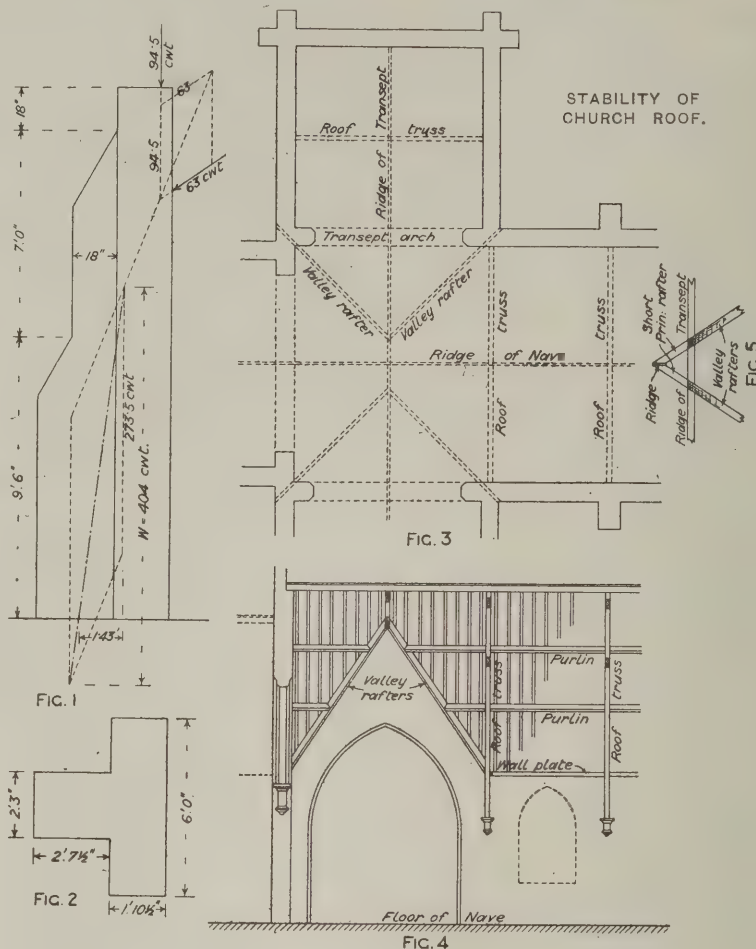

HARROW.—H. W. writes: "(1) Two years ago I had a house plastered inside with 'Sirapite' plaster, and a few months later, when it appeared to be fairly dry, some of the walls were coated with 'Duresco' distemper, and other walls papered. Soon afterwards the paper in many places showed signs of discoloration and the distemper in several places became covered with small tear drops of a gummy consistency. The distemper was of colours said to resist the action of caustic lime. The house has recently been repapered and the ceilings whitened with ordinary distemper, but although two and three coats have been applied to the ceilings they look very dirty, and appear to show the lines of the laths above. In one room, which has been papered with a red paper, the colour

has faded downwards for about 12 ins. from the picture-rail on the walls, which are built of brick, but not on one side which is a stud partition. The frieze above the picture-rail in this room also looks dirty and patchy on the three brick walls, but not on the partition. Papers in the other rooms are satisfactory. Can you explain the reason for this, and any method of preventing the ceilings looking dirty? (2) In one corner of the above house facing south-west there is a considerable amount of damp showing on the inside of the wall just above the skirting for several feet each side of the angle. The walls are 14 ins. thick, built solid to the first floor, with 9 in. rough-cast walls above. Can this be due to the walls becoming saturated by driving rain and the damp-course preventing its passing downwards, causing it to come out on the inside of the wall, or can you suggest any other reason and a cure for this?"

(1) There is little doubt that the discoloration in question is caused by damp and not by the caustic lime at all. The plaster on the ceilings must be very thin and inadequate if it allows the lime of the laths to show. I suggest that you paper the ceilings, or, if that be objected to, distemper them with "Hall's Distemper." I have found this better for ceilings than other preparations. (2) This damp undoubtedly rises from the subsoil, and the matter should be properly investigated. Is there any soil at that corner above the damp-course? Is there a leaky rainwater spout or downpipe there? Generally, I would advise investigation as to whether the rainwater does not run down the face of the rough-cast, especially on south and west aspects, and soak into the lower brickwork as soon as it gets to the lower edge of the rough-cast. If so, will it not be well to form a small tilting ledge along that line to discharge the water clear of the brickwork?

F. S. I.

STABILITY OF CHURCH ROOF.

Cowhouses.

LEEDS.—A.R.I.B.A. writes: "A client owns some old farm buildings. The cowhouse is considerably under the regulation size, and lacks light and ventilation. The local authority (in a country district) give notice for it to be pulled down and rebuilt, or they will close it. Have they power to do this, as it is a comparatively easy matter to enlarge the building so as to give the requisite cubic feet of air-space, light and air. My client is willing to do this but will not rebuild. What is his legal position in regard to the local authority? They have no by-laws relating to such buildings. What shall I take as the standard? In preliminary sketches I have allowed 700 to 800 cub. ft. per animal. The building has a lean-to roof 6 ft. at eaves and about 15 ft. at the highest point."

Section 34 of the Contagious Diseases (Animals) Act, 1878, empowered the Privy Council to make Orders for the lighting, ventilation, cleansing and water-supply of cowsheds and dairies, and for authorizing a local authority to make regulations for the purposes aforesaid. In 1885 the Privy Council made an Order under the Act (and that Order has the same effect as though it were an Act of Parliament). By section 8 of that Order it was provided that it should not be lawful for a cowkeeper to occupy any cowshed—whether old or new—"as long as the lighting and the ventilation, including air-space and the cleansing," were not such as were proper. By section 13 of the Order power was given to the local authority to make rules for regulating cowsheds, and it has been held (*Baker v. Williams*, November 1st, 1897) that this also includes power to make regulations as to "ventilation and air-space." Though the Privy Council have never issued a direction on the subject, it has become a very usual practice to insert in the local regulations a clause calling for 800 cub. ft. per cow as the minimum to be allowed, and such a figure (though variable

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics* :—

Parish hall on the northern side of Waynflete Street Earlsfield, and a house on the western side of Tramere Road, to abut upon Waynflete Street, on the application of F. E. Halford, on behalf of the Rev. D. Tudor Craig. (*Consent.*)

Projecting shops in front of Nos. 210, 212, 214 and 216, Mare Street, Hackney, on the application of Hodson & Whitehead, on behalf of H. & H. W. Rowlandson. (*Consent.*)

Iron and glass shelter in front of No. 17, Pembridge Square, Kensington, on the application of S. Dowsing & Sons, Ltd. (*Consent.*)

Retention of a wood, glass and zinc roof at the side of No. 144, Coldharbour Lane, Brixton, abutting upon Eastlake Road, on the application of J. Karno. (*Consent.*)

Buildings on the south side of Broughton Road, Fulham, on the application of Badenoch & Bruce, on behalf of the directors of Loud & Western, Ltd. (*Consent.*)

Extension of the period within which the erection of a Welsh Congregational Chapel on the northern side of Willenhall Road, Woolwich, was required to be commenced, on the application of J. M. Peate. (*Consent.*)

Buildings on the northern side of Mitcham Road, Tooting, to abut upon Ensham Street, on the application of H. J. Marten, on behalf of the Council of the Metropolitan Borough of Wandsworth. (*Consent.*)

Porch in front of the Baptist Chapel on the west side of the Bloemfontein Road, Hammersmith, on the application of R. N. Hewitt, on behalf of the building committee of the chapel. (*Consent.*)

Addition (jointing chamber) in front of the Barnsbury Telephone Exchange, Barnsbury Grove, Islington, on the application of C. Elliott, on behalf of the National Telephone Co., Ltd. (*Consent.*)

Re-erection of Nos. 95 to 103, Maida Vale, Paddington, with projecting porches and bay windows, on the application of Boehmer & Gibbs, on behalf of F. Britton. (*Consent.*)

Projecting clock in front of Nos. 127-130, Long Acre, Strand, on the application of E. R. Burch, on behalf of Morgan & Co., Ltd. (*Consent.*)

Projecting porch in front of No. 121, Victoria Street, Westminster, on the application of Farebrother, Ellis & Co., on behalf of V. S. & F. T. Galsworthy. (*Consent.*)

Porch in front of St. Paul's Church, Kingsdown Road, Islington, on the application of A. B. Cook. (*Refusal.*)

Iron and glass covered way in front of St. Mark's Vicarage, Kennington Oval, on the application of W. Fitch, on behalf of the Rev. J. Darlington. (*Refusal.*)

Iron illuminated sign at the Queen's Hotel, No. 104, Oxford Street, on the application of T. Holland. (*Refusal.*)

Retention of a wood and glass showcase in front of No. 8, Grafton Street, St. George, Hanover Square, on the application of F. Sage & Co., Ltd. (*Refusal.*)

Additions to No. 17, Sutton Place, Hackney, to abut upon Urswick Road, on the application of W. Gibbins, on behalf of A. Escott. (*Refusal.*)

Retention of a one-storey building at the rear of No. 54, Winsted Street, Battersea, abutting upon Surrey Lane, on the application of Greenfield & Cracknall, on behalf of F. C. Greenfield. (*Consent.*)

Four houses on the southern side of Tressillian Road, Brockley, on the application of H. J. Glanville. (*Consent.*)

New street for carriage traffic to lead from Eastmearn Road to Chatsworth Road, West Dulwich Lambeth, on the application of C. J. Bentley, on behalf of L. S. Rogers and A. & E. Rowberry. (*Consent.*)

Bay windows and porches to twenty-six houses on the south side of Oxford Gardens, Kensington, on the application of Trant, Brown & Humphreys, on behalf of Daley & Franklin. (*Consent.*)

Extension of the periods within which the erection of a projecting pent-roof to the fire-brigade station on a site on the north-east side of Eltham Road, Lee, and western side of Meadow Court Road, on the application of O. Fleming, on behalf of the Fire Brigade Committee of the Council. (*Consent.*)

Projecting sign in front of No. 45, New Bond Street, St. George, Hanover Square, on the application of G. & F. Kent, on behalf of E. Charvet. (*Consent.*)

Retention of an illuminated sign in front of No. 14, Hanover Court, Long Acre, on the application of J. P. Choate, on behalf of F. H. Berry. (*Consent.*)

Re-erection of No. 4, George Street, Woolwich, on the application of J. O. Cook, on behalf of J. Frankling & Son. (*Refusal.*)

New streets for carriage traffic upon the Hilly Fields Park estate, Vicar's Hill, Lewisham, on the application of W. H. Collier on behalf of the trustees of the Jerrard estate. (*Consent.*)

Deviation from the plan approved on December 18th, 1905, for the formation or laying-out of a new street for carriage traffic to lead from Fernhill Street to Auberon Street, North Woolwich, so far as relates to an alteration in the levels of the proposed street, on the application of Tapp Jones & Son. (*Consent.*)

New streets for carriage traffic out of Wavertree Road and Nuthurst Avenue, Brixton, on the application of Briant & Son, on behalf of A. A. Coffee and the Westminster Investment Society, Ltd. (*Consent.*)

Houses for persons of the working class on the north side of Beckett Street, the east side of Toulon Street and the east and west sides of Baily Street, Wyndham Road, Camberwell, on the application of — Oxtoby, on behalf of the Council of the Metropolitan Borough of Camberwell. (*Consent.*)

Deviation from the plan approved on January 23rd, 1906, under sections 13 and 22 of the London Building Act, 1894, for the erection of artisans' dwellings on the north-eastern side of Pond Place, Chelsea, so far as relates to an alteration in the position of the forecourt fence at the corner of Pond Place and the roadway leading to nslow Dwellings, on the application of Joseph & mithem, on behalf of the Council of the Metropolitan Borough of Chelsea. (*Refusal.*)

Open shed on the north side of Sumner Street, Southwark, on the application of F. Bailey, on behalf of the City of London Electric Lighting Co., Ltd. (*Consent.*)

Deviation from the plan approved on April 11th, 1905, for the formation or laying-out of a new street for carriage traffic, to lead from Fulham Palace Road to Colehill Lane, Fulham, and, in connection therewith, the erection of buildings, so far as relates to the substitution for the two blocks of residential flats of four shops, on the application of A. Blackford. (*Consent.*)

Building at the rear of No. 363, High Street, Lewisham, on the application of the Magneto Motor Cycle and Electrical Engineering Co. (*Consent.*)

Removal of a fence at the rear of No. 2, Kelso Place, Kensington, and also to the closing of openings in the rear wall of such building, on the application of G. E. Bucknill. (*Consent.*)

Uniting of No. 45, Piccadilly, with a building on the eastern side of Albany Courtyard on the application of G. D. Martin. (*Refusal.*)

The Theatres and Music Halls Committee also reported the following :—

Plan with regard to a sale of work to be held at the Portman Rooms on March 8th. The arrangements shown on the plan appear to be satisfactory. (*Consent.*)

Plan, submitted by the Thames Electrical Joinery Co., Ltd., showing a proposal to cover with asbestos millboarding the enclosure of the lift from the beer cellar to the first floor of the Café Vaudeville, Strand, with a view to complying with one of the Council's requirements with regard to the building. The Committee think the existing matched-board enclosure should be replaced by one of hard or non-inflammable wood. (*Refusal.*)

Plan, submitted by the Town Clerk of the Royal Borough of Kensington, showing a proposal to provide a gas-heated plate warmer on the landing of the gallery staircase of the Kensington Town Hall. By the proposed arrangement the landing would be reduced in width from 7ft. to about 5ft 6ins., and would be further obstructed by persons using the apparatus. The Committee do not consider that an exit staircase should be used for the purpose proposed. (*Refusal.*)

Snow Hill Station, Birmingham, built in 1871, is to be reconstructed. When finished the new station will be considerably more than twice the size of the present building, for it will stand upon land bounded by Colmore Row, Snow Hill, Livery Street and Water Street. The Great Western Hotel is to be materially altered and improved, and the existing buildings on the Snow Hill side are to be taken down and several blocks erected in their place, these including waiting-rooms, refreshment-rooms, a small booking-office, telegraph offices, stationmaster's apartments, cloakrooms, and a left-luggage department. On the lower side of Snow Hill, near Great Charles Street, a spacious parcels yard about 200ft. long is to be provided.

Sheffield Society of Architects and Surveyors.—Before this Society on Thursday last Mr. J. B. Mitchell-Withers delivered a lecture on "Early Eighteenth-century Architecture." He commenced by referring to Greenwich Hospital as the building where the work of Inigo Jones and Sir Christopher Wren could be seen to advantage; but portions of which were built by various architects in the eighteenth century, of whom Sir John Vanbrugh and Hawksmoor were the most celebrated. He then dealt with buildings in London, the chief of these being St. Mary Woolnoth, St. Mary's-in-the-Strand, and St. Martin's-in-the-Fields. He also referred to the buildings erected at Oxford and Cambridge, such as the Fellows' building at King's and the Senate House at Cambridge, and the Radcliffe library and buildings to the High Street at Oxford. Domestic and street architecture of this period was illustrated by a number of views of buildings at Bath and Stamford, concluding with views of Blenheim Palace and Castle Howard, both of which were built by Sir John Vanbrugh.

Correspondence.

The Architects' Enrolment Bill.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—As some of your readers are doubtless aware, a sub-committee of the R.I.B.A. is sitting to collect evidence concerning the above measure. Before this I was recently summoned as a provincial architect, and attended with the approval of the president of the Bristol Society of Architects. There I upheld the cause of registration, pointing out that Western architects were practically unanimous in their desire for a measure that should protect both the profession and the public. But I hardly expected that so good an illustration of the efficiency of registration would appear so shortly in my own city as that afforded by the recent medical prosecution. I, therefore, venture to send you a report of the proceedings, taken from the "Western Daily Press." Stripped of all extraneous matter, it reads as follows :—

"Mr. Wansbrough, in opening the case, said . . . the Act of Parliament under which the proceedings were instituted was the Medical Act of 1858, which stated that it was expedient that persons requiring medical aid should be enabled to distinguish qualified from unqualified practitioners. Section 15 set out the conditions of registration. Under section 40 of the Medical Act it was provided that any person who should wilfully or falsely pretend to be, take, or use the title of doctor contrary to the provisions of the Act, should be liable to a fine not exceeding £20. Defendant was not registered, as would be conclusively proved. . . . What defendant had done was to use the prefix to his name of 'Dr.' He called himself 'doctor,' and he (Mr. Wansbrough) submitted that it was as clear as daylight that if a person practising in any way in the curing of people called himself 'doctor,' the suggestion was that he was a doctor of medicine; and if he was not registered he was undoubtedly liable to conviction. . . . According to advertisements, defendant practised as a medical electrician, and represented himself to be such. If in that connection he represented himself to be a doctor, then he (Mr. Wansbrough) submitted that, beyond question, he contravened the provisions of section 40 of the Medical Act, and that, not being registered, he was unquestionably liable to the fine provided for under that Act for each offence.

"Mr. Wethered, on behalf of the defendant . . . remarked that the use of the word 'doctor' did not necessarily imply that he was a registered practitioner under the Act. . . . To bring him within the Act, defendant must use some title which implied that he was a practitioner registered under the Medical Act. That he had not done. What was more, he never practised medicine, but practised treatment; nor did he hold himself out to be a medical practitioner in the ordinary sense. . . . The magistrates . . . were of opinion that—first, the defendant intended the public to believe that he practised as a doctor in healing disease; second, that he wrongly called himself doctor; and, third, that he did this for his own personal benefit, and thereby gained a livelihood."

Here, then, we have an instance of how the registering of a title or designation has again proved effective in protecting both the public and the fair name of an honoured calling. The Bench, moreover, appear to have been of opinion that the public had become habituated to associating those who use a certain title with those who discharge certain duties. Hence, if the Enrolment of Architects' Bill became law, the public would gradually come to understand that architects were only those who had received a certain training and pursued a certain calling. Thus the Bill would bring about a reform which, in the opinion of the vast majority of architects, is now become imperative.—Yours truly,

BRISTOL. HAROLD SMITH, A.R.I.B.A.

"Competition Design by Proxy."

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In your recent leader under the above head you say that "if they (draughtsmen) have the ability to win competitions for their employers, they have it also for themselves." True, but if compelled by necessity to spend the best hours of the day "ghosting," only the most robust are able to compete on equal terms with those who can give all their time and attention to their own work. Competitive work, even when successful, means capital to start with. An architectural student does not become a draughtsman should he be able to provide for himself and his own without resorting to such speculative work as competitions.—Yours truly,

BARNES. ASSISTANT.

Electrical Notes.

On Testing the Efficiency of Electric Lights.

Just as with heating apparatus it is difficult to determine the precise efficiency of any particular form, so in regard to the candle-power of artificial illuminants considerable difficulty is often experienced in ascertaining the exact figure. In this connection it is interesting to turn to the paper on "Some Recent Electrical Measuring Instruments" which Mr. Kenelm Edgcumbe, M.I.E.E., A.M.I.C.E., read before a recent meeting of the Junior Institution of Engineers. He made extended reference to photometers, which, though perhaps not strictly electrical instruments, are intimately connected with electric lighting. He observed that so long as lights of the same colour—or nearly the same colour—were to be compared, the difficulties were not great, and either a Lummer-Brodhun or a Trotter photometer would give perfectly consistent and accurate results. If, however, the lights differed in colour the problem became extremely involved. Some authorities had even gone so far as to say that it was incorrect to speak, for instance, of the "candle-power of an arc lamp" on account of the physiological effect of so white a light being different from the more yellow light of a candle. However that might be, it became absolutely essential to find some basis on which the illuminating power of various sources of light might be compared, even when as different in colour as the mercury vapour lamp and the flame arc. In all ordinary photometers the measurement consisted almost invariably in the comparison of two surfaces illuminated respectively by the two sources of light to be compared.

The brightness of one or both of these illuminated areas was then varied until, as nearly as could be judged by the eye, equality of illumination was attained. From a knowledge of the candle-power of the standard and the respective distances of the two lights from the screens the candle-power of the other light could be at once calculated: though in making this calculation it was to be remembered that the illumination decreased inversely as the square of the distance of the light from the screen. With any such photometer it was found, as might well be imagined, that to obtain a balance of illumination when the lights were of different colours was a matter of extreme difficulty.

To Overcome the Difficulty.

Mr. A. P. Trotter had suggested a method of getting over this difficulty, which consisted in employing two differently tinted screens to receive the two lights. For example, if an arc lamp was to be compared with a glow lamp standard, an orange-yellow screen might be employed for the arc and a bluish screen for the glow lamp. By choosing suitable tints the screens could be made to appear almost identical in colour when illuminated by their respective lights, and an accurate balance was easily obtained. The objection to this method was that a constant had to be found for each pair of screens, and this constant would depend upon the relative colours of the lights under test. Moreover, it could only be determined by comparing two known lights of the same colour by means of the screens, so that the difficulty of obtaining the constant, and the inaccuracy thereby introduced, was considerable.

The "Flicker."

Of late years the "Flicker" photometer had been coming into favour. The principle of this device, which was originally due to

the work of Hood, Whitman and others, was that the surfaces illuminated by the two lights to be compared were alternately presented to the observer's eye in rapid succession. If they differed to any extent in brightness a distinct flickering was noticeable, which diminished and eventually disappeared altogether as the two illuminations were made more and more nearly equal. It was, moreover, found that a perfectly definite point of balance could be obtained, in spite of all ordinary differences of colour.

All photometry was largely a matter of experience, and a practised observer could probably obtain more accurate results with a spot of candle grease on a sheet of note-paper than a novice could with the most perfect photometer extant, and one advantage possessed by the "Flicker," as compared with the ordinary photometer, was the great ease with which an ordinary observer could form an opinion as to whether or not any flickering was present in the field of view. In the hands of an experienced worker, however, so long as the two lights to be compared were of the same or nearly the same colour, the "Flicker" photometer was more sensitive than the ordinary Bunsen grease spot, though not so sensitive as either the Trotter or the Lummer-Brodhun; and, as regards lights dissimilar in colour, accurate results could be obtained by its means, as already pointed out, in cases where the ordinary photometer completely failed.

For street lights, too, photometers constructed on the "Flicker" principle were used. Associated with them was the vexed question of whether candle-power or illumination measurements should be made. All things considered, however, Mr. Edgcumbe thought that the best standard was a small 8 or 10-volt glow-lamp worked off a portable accumulator having a capacity of 15 or 20 ampere-hours.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

DRAUGHTSMAN and CLERK OF WORKS, 25 (Ferro - concrete), desires RE-ENGAGEMENT. Sound practical experience; measuring, checking, plotting and construction, tracer and colourist; excellent references; salary moderate.—Box 1658, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S ASSISTANT. Three years' London office experience. Hard worker, good designer, details, working drawings, and specification writing. Highest references. Could take charge of small office, town or country. Very moderate salary if good opportunity for advancement.—H. J. W. E., 2, Stone Villas, Camberwell Grove, S.E. 1639

ARCHITECTURAL ASSISTANT (Scotch) wants situation in London office. 12 years' city experience. Energetic, enterprising. Successful in office and school, and gained some reputation as a plodder. Quick draughtsman and good at perspective.—G. M. STEWART, 308, Possil Road, Glasgow. 1642

ARCHITECT and SURVEYOR'S ASSISTANT DISENGAGED shortly; 10 years' all-round experience; design, general and detail drawings, specifications, surveying, levelling, &c. Honours, South Kensington; ex. testimonials.—Box 1646, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S JUNIOR ASSISTANT (23), 5 years' experience, good draughtsman, design, working drawings, detail, and general routine. London or country.—B. A. E., Glebeside, Preston Park, Brighton. 1649

ARCHITECT and SURVEYOR'S JUNIOR ASSISTANT (23) open to engagement, 6½ years' experience, abstainer, excellent references, 25s. per week. Box 4, "Herald" Office, Carnarvon. 1652

ARCHITECTURAL ASSISTANT (27) desires re-engagement. Nine years' varied London and Provincial experience. Design, details, working drawings, perspective, &c. Excellent testimonials. Moderate salary.—Address Box 1651, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S ASSISTANT (23), 6½ years' Midland experience on competitions, surveys, working drawings, details, &c., domestic and public. Low salary.—Box 1654, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECTURAL DRAUGHTSMAN desires engagement with a London firm of Architects; 7 years' London and Provincial experience. Neat and accurate draughtsman. Good references. Design, working and detail drawings, perspective and general routine. Moderate salary.—Apply A. C. E., 98, Elspeth Road, Clapham, S.W. 1655

ARCHITECT'S JUNIOR ASSISTANT (23), five years' experience, neat draughtsman, quantities, good refs.—W. P. WALKER, Chantry Drive, Ilkley, Yorks. 1660

ARCHITECT'S ASSISTANT (23) requires ENGAGEMENT; 6½ years' experience; working drawings, details, perspectives, assist quantities, &c.; excellent references.—DAVIES, New Park House, Shrewsbury. 1681

ARCHITECT and SURVEYOR (Young) is prepared to assist in the preparation of contract and competition drawings; also surveys for dilapidations and alterations, &c. 10 years' London experience. Terms moderate.—E. C., 100, Archway Road, N. 1685

BUILDER'S CLERK (20) seeks engagement; 4 years' experience book-keeping and general office routine, quantities and estimates, good references.—W. M., Olive House, New Dalton Street, St. Albans. 1679

BUILDER'S CLERK, experienced, double-entry, book-keeping, time sheets, correspondence, and general routine, plans, &c.; town or country; moderate salary.—E. W. H., 11, Archibald Road, Tufnell Park, N. 1661

BUILDER'S CLERK or ASSISTANT (30) seeks RE-ENGAGEMENT. Proving a experienced, estimates, quantities, bookkeeping, adjustments, p.c.'s drawing. Ten years public works and office. Best references.—Box 1657, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

CARPENTER and JOINER'S IMPROVER (18) requires situation; 4 years' experience, own tools, well up in work, town or country.—Wm. B. MACLACHLAN, Burnside Cottage, Tarbert, Harris N.B. 1643

CARPENTER and JOINER (young) requires EMPLOYMENT. Capable, and of varied experience.—A. BLADE, 43, Clifford Gardens, Kensal Rise, N.W. 1612

ELECTRICIAN, experienced, requires berth. Used to management of department, estimates, specifications, installations, &c., of lighting, bells, telephones, and motors; West-End experience. Practical man; good references. Box 1664, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

FOREMAN of PAINTERS; thoroughly practical, energetic, and reliable; town and country experience; good refs.—S. A., 116, Fernhead Road, Paddington, W. 1638

GENERAL WORKING FOREMAN CARPENTER seeks RE-ENGAGEMENT; well up in plans and details; practical in all branches; just finishing job.—AUSTIN, 122, Bathurst Gardens, Kensal Rise. 1645

JOINER. Used to Hand and Steam Joinery work. Competent throughout; got all tools; sober and reliable; non soc.; London and suburbs.—D., 123, Vicarage Lane, Stratford, London, E. 1640

JUNIOR DRAUGHTSMAN, age 18, requires SITUATION. Neat drawing, tracing, colour-work, &c.; experience in architect's office; salary, 18s.; Specimens of work can be sent.—J. H. D., 11, Colville Road, Bayswater, W. 1683

PAPERHANGER, PAINTER, &c. Thoroughly experienced. If piecework, can estimate for new or old work, with or without materials; if daywork, good colourist and manager.—Address, PAPERHANGER, 162, Walmer Road, Notting Hill. 1614

PLUMBER (experienced, Registered), Gas and Hot Water Fitter, wants JOB or CON-STANCY, Good Lead-layer. Well up in latest sanitary work. Town or country. Suit builder or good jobbing shop. References.—F. H., 45, Newry Road, St. Margaret's, Middlesex. 1662

QUANTITIES.—Surveyor, with London office, prepares Quantities, Estimates, Variations, &c. Terms by arrangement.—Box 1468, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

SHOP FOREMAN of JOINERS seeks ENGAGEMENT; reliable, practical with machinery, country preferred.—Box 1680, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

SURVEYOR or ARCHITECT'S ASSISTANT (20) requires ENGAGEMENT; 3½ years' practical experience in Surveyor's office, good draughtsman, surveyor and leveller; certificates in building construction, mathematics, mechanics, and geometry; salary, 21s. weekly.—RICHARD J. WICKES, 39, Oxford Road, Kilburn, N.W.

TO ARCHITECTS.—Your QUANTITIES TAKEN OFF in your own office at reasonable terms per hour or job. Fourteen years' experience with leading London surveyors.—NUNN, 23, King's Rd., Willeeden Green n. 1682

WORKING FOREMAN PLUMBER, Gas and Hot Water Fitter, 35, well up in all trades. Thoroughly experienced in management and carrying out any kind of work. Draughtsman, and up to specification and contract. Town or country. Reliable and good character.—"EXPERIENCED," 124, Saltcott Road, Clapham Junction. 1684

Drawings, Tracings &c.

ARCHITECTURAL ARTIST.—Academy Exhibitor; perspectives in line, wash, and colour for competitions, exhibitions, &c.—B., 77, Dartmouth Road, Forest Hill, S.E. 1588

DRAWINGS from rough sketches, designs, details, specifications, drain plans, and quantities prepared; terms moderate.—J. W., 8, Rylett Crescent, Shepherd's Bush, W. 1615

PERSPECTIVES effectively executed. General architectural drawing.—C. H. SIMPSON, 12, Titchborne Street, Cambridge Square, W. 1650

WORKING DRAWINGS, DETAILS, DRAINAGE PLANS, TRACINGS, &c., prepared.—F., 35, Oxford Road, Kilburn, N.W. 1663

Appointments Vacant.

ARCHITECT'S PUPIL. VACANCY in busy West-End office; small premium, but must be fond of drawing.—STANLEY-BARRETT and DRIVER, Architects, 23, York Place, Baker Street, London.

CLERK wanted, young, for Builder's office, country town, well up in routine. State experience and wages required. One as above, smart, could have interest in the Business.—HAWKESFORD, Builder, Market Drayton, Salop.

PAVEMENTS.—WANTED AGENCY for Euboeolith, Lithosilo, Torgament, and Stonwood Pavements for Ireland.—Apply Box 1686, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

SMART YOUTH WANTED for Builder and Contractor's office in the Midlands. Good opening for gentleman's son to learn the whole business. If suitable to be bound for four to five years according to age. Premium required.—Apply O. P. DREVER, Builder and Contractor, Kettering, Northants.

WANTED at once, **DRAUGHTSMAN** who thoroughly understands Reinforced Concrete and Structural Steel Work. State qualifications, experience, age, and salary wanted. All applications treated in strict confidence.—Write H. S., c/o HASTINGS BROS., Ltd., 1, Arundel Street, Strand, W.C.

WANTED, by an old-established firm of Manufacturers in London, a capable and energetic REPRESENTATIVE, acquainted with Builders, Contractors, and Engineers, to travel in part of London and Suburbs, and other places. Not more than 35 years of age. Unexceptional character and gentlemanly appearance. Remuneration, partly salary, partly commission. Good permanent post for suitable man.—Apply in first instance, with copies of testimonials, and stating remuneration required, to "MANUFACTURERS," Box 1678, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

Businesses Wanted & for Sale

FOR SALE (by private treaty).—Plumbing, Decorating and Job Building Business, situate in the neighbourhood of Stroud; disposal solely through ill-health; excellent opportunity for carpenter and plumber; ingoing about £200.—For full particulars apply to NELMES, POOLE & ATKINS, Auctioneers, John Street, Stroud.

FOR SALE.—**BUILDER AND CONTRACTOR'S BUSINESS** in West of England Genuine concern, in same family nearly a century. £600 required or valuation.—Box 1673, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

Miscellaneous.

CENTROLINEAD, "Rivington's Construction, Materials," Vols. II., III.; "Quill's Encyclopedia," all good condition, cheap.—Box 1656, BUILDERS' JOURNAL Office, 6, Great New Street, E.C.

HAND-POWER JOIST SHEAR (second-hand, but first-class condition) for cutting girders up to 12 in. by 5 in., and channels, angles, tees, flats, &c., correspondingly, with Punching Attachment, to be sold on account of erecting a power machine; exceptional bargain for girder merchants, contractors, light roof makers, &c.—Apply XX., BUILDERS' JOURNAL Office, 6, Great New Street, E.C.

POLING BOARDS, selected lengths and thicknesses (best quality and full measure). Also Scaffold Boards, Putlogs, Scantlings, Deals, Battens, and Boards. Lowest wharf prices.

C. H. GLOVER & Co., Ltd., Importers, Hatcham Saw Mills, Old Kent Road, S.E.

TO ARCHITECTS, BUILDERS, and ENGINEERS. MARTIN & SANDER, of 4, Manor Road, Stoke Newington, N., photograph this class of work, and can operate on short notice.

WOOD BLOCK FLOORING. Builders' own material laid; labour only or labour and composition; work done any time and any distance.—Address, A. KENT, 141, Church Road, Battersea, London S.W. 1637

WOOD MANTELPieces, CHEAP (Showroom Clearance). Special value, worth seeing.—12, New Oxford Street, London, W.C.

WANTED—Quotations, lowest cash price for one each of the following:—"Fletcher's History of Architecture"; "Rivington's B.C.," Part 3; "Moore's Sanitary Engineering"; "Pea's Estimating"; "Quantities," Davies; "Specifications," Leaning.—Address E. D. DENNIS, Sedburgh, Yorks.

YORK Stone Sills, Steps, Templates, and other worked stone cheap. Send for price list.—KELLY & Co., Stone Merchants, Mill Hill, N.W., and Kilburn, N.W.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

February 28th, 1906.

CONTRACTORS' SUPPLEMENT (MONTHLY).

FOREWORD.

IT is our opinion that a trade paper such as THE BUILDERS' JOURNAL should provide information on every side of the architectural profession and the allied building trades, so as to be not only a means of intercommunication, but sufficiently comprehensive to save busy men—and who is not busy nowadays?—from having to seek in several journals the news connected with their business.

With this object in view we are continually extending our sphere. Lately we have directed particular attention to the structural side of architecture, and also have added a supplement devoted to fire-resisting construction and fire-prevention. We feel now, by adding the "Contractors' Supplement," that we reach the "headstone of the corner" of the journalistic edifice which we have been building these eleven years.

The special information that this "Contractors' Supplement" will deal with may be briefly summarized as follows:—

Lists of current prices of specialties and of commodities sold in the open market.

Reports on the various trades that make up the building industry and from the chief centres, contributed by special correspondents, such as:—

The Stone, Granite and Marble Trades.

The Slate and Tile Trades.

The Clayworking Industry.

The Cement Trade.

The Ironmongery Trade.

The Timber Trades.

The Paint Trade.

The Metal Trades.

The Glass Trade.

The Wallpaper Trade, &c.

Reports on openings for trade at home and abroad.

Notes on the labour market and current rates of wages.

Illustrated articles by eminent authorities on innovations in the erection of buildings, &c., the organization and office work of builders' businesses, contractors' plant, new materials, new appliances and new methods of manufacture, &c., &c.

Interesting personal news and notes.

Information on Contracts open for tendering, in extended form.

The ordinary issues of THE BUILDERS' JOURNAL will be enlarged when necessary to include news of momentary currency, such

as contracts open, tenders, market prices, bankruptcies, &c., upon the lines adopted in this supplement.

It is always impossible to perfect the organization of a new feature by the first issue, and we therefore ask the indulgence and assistance of our readers. There are many details which have not yet been worked out, and we feel that the information as regards prices and trade reports on the various industries are not complete. We shall be glad to receive information regarding business happenings, changes in prices, openings for trade, &c., and shall be pleased to consider articles and illustrations on subjects of interest to contractors and others engaged in the execution of building works, new methods of construction, &c.

No extra charge will be made for these monthly supplements. We feel they are needed, and that our efforts to make THE BUILDERS' JOURNAL strong in character, attractive in contents, and necessary in information will compel the attention of all architects and builders, thus making this publication one of the essentials of their business life.

We count on the support of our many friends to make these supplements valuable aids towards the advancement of the building trades.

BUILDERS AND BUILDING.

By Howell J. Williams, L.C.C.

I HAVE been asked to contribute to this "Contractors' Supplement" the first of a series of articles by builders and others connected with the building trades. The only difficulty I experience is as to the special side of building or builders' work which I should take as my subject, but perhaps I cannot do better than give a series of observations upon the changes that have occurred during my own business career of more than twenty years. That there have been great changes from the builder's standpoint during the past quarter of a century will be readily apparent to everyone.

Masters and Men.

The old order, when the builder was practically an autocrat and could "say things" to workmen and foremen, has now almost passed away, owing to the more or less successful combination of the men in their trade-unions—combinations of considerable strength which have resulted in much greater independence for the men. The great strikes of former years have taught both sides useful and necessary lessons. The builder has learnt that workmen are entitled to consideration as regards their hours of labour and wages, and also in the way they are treated. He has realized that it is for the best that a minimum wage should be established in order to prevent unscrupulous employers obtaining an advantage over their more honourable competitors by beating down individual workmen to get their labour below the fair minimum. The strikes have also caused employers to strengthen their

FIG. 1.—FOUNDATION WORK AT THE "DAILY MAIL" BUILDING.

FIG. 3.—STEELWORK AT THE "DAILY MAIL" BUILDING.

position, by uniting in an association for their mutual protection; and now that the organizations of both sides have gathered such strength, the risk of disputes being decided by the old barbarous methods of strikes has been considerably lessened, for both have come to agreements in respect to rules for conciliation and arbitration. All this shows that there has been a general growth of good feeling not only among the men but also among the employers.

It is a matter for discussion whether the near future should not see this method of conciliatory settlement of disputes extended still further by the promotion of compulsory arbitration.

The Old and the New Builder.

The growth of these organizations, together with other causes, has, however, had a tendency to so increase the capital required in a large builder's business that the old-fashioned builder—the man who had risen

to be a large contractor from a bricklayer, a stonemason, a carpenter or even a navvy—is now almost passing away. Perhaps we may have cause to regret the disappearance of the builder who has had individual training and has become a master of one or perhaps more of the trades that constitute the building industry. Many of the chiefs of our large building concerns at the present time are financiers and gentlemen with office training who delegate to various heads of departments and foremen the control of the work, so that nowadays the personal heads of many businesses are not always intimately acquainted with the work they are carrying out. Particularly must this be so in the furnishing and drapery firms who are pushing into heavy building work by their financing "wheels within wheels" methods. It is not every builder whose name may be associated with the erection of an

important building who would be able to personally superintend the work in any one of the trades that might be concerned. The tendency is for builders to become less and less men of sufficient experience to be able to direct operations. This, owing to the rapidly developing modern system of contracting, is by the latest indications likely to be extended by

The Americanizing of the Building Trades.

I do not say whether it would be for better or for worse to see in London such a firm as the George R. Fuller Building Construction Co., of New York and Philadelphia, established with a capital of £20,000,000 sterling, whose operations include the buying-up of

FIG. 2.—CLEARING THE SITE FOR KLEINWORT'S NEW BANK IN FENCHURCH STREET, LONDON.

FIG. 4.—THE PARTIAL FRAME CONSTRUCTION AT THE "DAILY MAIL" BUILDING.

FIG. 5.—SHOWING PROGRESS MADE WITH MAIN WALLS WHILE WAITING FOR STEELWORK FOR FLOORS BETWEEN.

sites for the erection of buildings and the sale of the completed article to the customer, thus abolishing the present system of architect and builder; but if such companies really came into existence in this country they would certainly destroy the builder and very largely the architect too.

Increasing Difficulties for the Builder.

At the present day the builder has to encounter much greater difficulties than he had twenty years ago. There is the problem of rebuilding premises in increasingly congested centres. Then there are the greater difficulties created by amendments to the various building Acts, and the anomalies existing in the by-laws of central and local authorities, these being seldom administered with that common-sense and reasonableness which they should be, being too often interpreted in a cast-iron manner without any appreciation of the fact that circumstances alter cases. The responsibilities of the builder owing to the Workmen's Compensation and other Acts having a direct bearing on the trades are greater now than they were formerly, and they have given rise to the modern insurance system.

Again, far-reaching changes have been wrought by scientific progress in the direction of sanitation and ventilation and other matters that have resulted in the greater elaboration of modern buildings. Everything nowadays seems to be specialized, and the builder is only left to execute the carcass. All this tends more and more to make him

An Office Man

rather than a master of trades. I have an instance in mind of a job where the builder's actual priced work was a small sum of about £6,000, and the provisional sums were in excess, so that the total cost of the job was about £14,000. The builder is not only called upon to pay these provisional sums but has to pay the district surveyor's fees, and so act as the general financier.

Another of the great difficulties of the latter-day builder is the

Lack of Really Trained Men

with the ability and capacity, nerve and strength of will to take charge of works. This is undoubtedly due to the persistent decay in the apprenticeship system, although possibly it may also be due to the lack of prizes and rewards adequate to the enormous amount of detailed knowledge required. The salaries and wages of foremen are not such as to tempt men to devote the requisite time to technical instruction and training that is necessary in addition to the personal experience of a craft. We might do well to adopt some such system, to occupy the place of the apprenticeship system, as that of the Boule School in Paris, where in certain trades connected with the building industry boys are apprenticed to the municipality for four years, beginning at about the age of thirteen, and are thoroughly trained in both design and craftsmanship, their general education being continued for about one or two hours every day while they are learning their craft. We need some such set of highly-trained craftsmen to form a leavening in the building trades to-day in order to give the necessary stimulus to efficiency.

The almost insurmountable obstacles, however, to men with such qualifications being able ever to become master-builders on their own account under modern conditions is again a factor in preventing some of the best talent remaining in the building trades. The difficulties of obtaining an opportunity of securing sufficient capital and the necessary entrée into the "invited to tender" lists of the architectural profession are almost insurmountable, and the chances of young men establishing themselves as builders to-day are infinitely fewer than they were years ago. Many architects might be the making of young men in this direction, but

fail to give them the necessary opportunity, preferring to ignore the personal man with whom they might do business and to run after a name in connection with a firm the founders of which have passed away years ago, the management now being in the hands of the class referred to above.

The writer can never forget his indebtedness to two or three well-known architects in the City, particularly the late Mr. George Barnes-Williams, who gave him his first opportunity of a fair-sized job, which would now have been given to an established firm able to show photographs of fine buildings erected by them.

Competition.

The difference between competition in the architectural profession and in the building trades is that, whereas open competitions have given their chance to some of our most brilliant young architects with ability and genius, on the other hand the most brilliant of technically and manually trained artisans, even with all the qualifications necessary for master-men, never get a chance of showing their capacity as master-builders, for the competition has to be one of price, and the more reckless or the largest speculator—and sometimes the keenest candidate for the Bankruptcy Court—is the one who obtains the work.

Cheapness nowadays covers almost everything, and a good builder, master of his business and its detail, able to take personal responsibility and control, may be passed over, leaving him without a continuity of employment for his employees, the want of which is one of the greatest curses of the building trade of the present day.

On Behalf of the Workman.

One frequently hears the phrase, "A fair day's work for a fair day's pay," and talk of the difficulty the employer has to obtain it from his workmen, but it is to be wondered at that the workman's heart and soul is not in his work, particularly as regards expedition, when the probability is that directly he has completed his work the reward he will receive will be his discharge. It may be that some other method of remuneration than the hour wage is needed in the building trades in order to encourage and bring out the best in the British artisan. One may well doubt the all-sufficiency of technical institutes—even scholarships—to which he is expected to apply himself voluntarily after his day's work.

The question as to adequate reward and remuneration for the best services, either by masters or by men, apart from specialists, is

always worthy of consideration, provided there is a fair equivalent in value.

I now come to the second portion of my subject, namely,

The Methods of Building.

These have altered very considerably, together with the improvements and specializing in almost every branch of building work. This has led to contractors' work tending more to engineering than to building work.

Upon the more general aspect we may note a change in regard to the provisions of basements in buildings. Often, indeed, there are two basements. Owing to the electric light, however, they are no longer dark cellars but constitute valuable spaces.

The rebuilding of premises in restricted areas necessitates much greater care in demolition, and the existing regulations regarding the carriage of materials during certain hours, so as not to interfere with business in the City of London, and also with the object of avoiding nuisance from dust, give much more trouble to the builder. (See Fig. 2.)

Commercial interests have again required the builder to proceed with greater speed than formerly. He often has to work night as well as day.

Improvement of Plant.

There has been an improvement in plant for the erection of buildings. Firstly, we have the Scotchman (or derrick) on a gantry, and latterly electric lifts have been arranged to raise materials to their positions. There has also been a change in building construction.

When the writer first started in business, flitch-plates were introduced in a beam; when extra strength was required; then followed cast-iron stanchions and bressummers, these giving place to wrought-iron, and latterly steel and the numerous patent systems of concrete and fire-resisting construction.

Iron and Steelwork.

Iron and steel were first used to a very limited extent, and the building by-laws and regulations did not aid in the development, requiring brickwork to be supported by brick or stone to the foundations. In the "Daily Mail" offices (which the writer constructed in 1898) this system of using steelwork as an aid rather than a dominant partner in the construction is to be seen. Fig. 3 shows how the steel was encased in brickwork, the stanchions seldom extending beyond two floors, one of the longest being shown in Fig. 4. The girders generally took a bearing upon stone templates built into the brickwork. Such a system, it will be readily understood, is not

FIG. 6.—SHOWING UNDERPINNING OF GANTRY.

altogether satisfactory. It continually causes delays, because in some cases the contractor would be waiting for the steelwork, and as soon as he was started the steelwork contractor would have to wait for the general contractor. Fig. 5 shows how the writer found it desirable to proceed with the erection of the walls, leaving open a portion waiting for the steelwork. It is much more convenient, of course, to complete floor by floor, and thus such a partial frame system is undoubtedly not so advantageous as a complete steel frame such as was adopted recently at the Ritz Hotel. Here it will have been noticed that the steelwork was the most important part of the structure, this being erected complete and being self-supporting. The "Daily Mail" offices may be cited as one of the first examples where the steel grillage foundation was adopted (Fig. 1). It was almost an unheard-of thing at one time to extend the concrete in the foundation over the whole site as well as in the trenches, and of the same thickness, though the concrete raft has now become quite customary. In this instance, however, the foundation work was taken a step further by the steel grilles and frames being embedded in the concrete raft. This job was completed in the very short time of seventeen months, and is an instance of how the contractor is often interfered with by the client desiring to use a portion of the building before it is all completed. Fig. 6 shows the rolls of paper for the machines which were already working in the basements, although the construction had not proceeded above the first floor. This figure also has reference to the consideration of the steel frame in relation to the advantages afforded in

The Saving of Scaffolding.

In the American steel frame system the derricks are taken up with the steelwork, and the scaffolding consists of staging supported out from the steelwork. This view shows how at the "Daily Mail" offices the proprietors required to use the floors before the contract was completed, necessitating the underpinning of the Scotchman, the legs of which are to be seen supported on temporary steel girders.

These are a few only of the changes in methods of building, the limitation of space in these columns alone restricting reference to further examples, but they suffice to indicate the altered conditions of builders and building to-day, and the influence of the steel and other specialists dominating modern building.

New Companies.

WOLNA SCAR GREEN SLATE CO., LTD., Broughton-in-Furness. Capital: £1,128.

LONDON PAINT AND VARNISH CO., LTD., to acquire the business carried on at West Drayton, Middlesex, as the Resilta Co., and to adopt an agreement with Patents and Industries Ltd. Registered office: 3, London Wall Buildings, E.C. Capital: £10,000.

PEERLESS PATENTS CO., LTD., to acquire the business carried on by S. Booth at Bridge Mill, Warrington, as the Peerless Patents Co., and to carry on the business indicated by the title and that of builders' merchants, manufacturers of and dealers in stone, slate, clay, timber, &c. Capital: £7,500.

Portsmouth Master-Builders' Association.—Mr. G. R. Chamberlain has been elected president of this Association for the current year.

The Association of Master-Painters in Scotland held its annual meeting at Aberdeen recently, when Mr. Alexander Latto, of Aberdeen, was elected president. The next annual meeting will be held at Glasgow.

An "At Home" in connection with the Edinburgh and Leith building trades was held in the Royal Hotel, Edinburgh, on Thursday evening last. The function was under the auspices of the Master-Builders' Association and the Building Trades' Exchange.

THE LABOUR MARKET.

Board of Trade Returns for January.

THE Board of Trade returns show that employment in the building trades remained dull in January, and showed little change as compared with a month and a year ago. Returns from fifty-three London employers showed that in the last week of January they paid wages to 9,961 workpeople of all classes, compared with 9,745 in December and 11,127 in January, 1905. Employment generally in London was rather worse than a month ago, and much worse than a year ago. Returns from employers' associations in sixty-three districts outside London stated that in three-fourths of them employment was the same as a month ago, and in one-sixth, including Halifax, Birmingham, Swansea and Aberdeen, it was worse than a month ago. Compared with a year ago, employment was reported worse in twenty-six towns and about the same in thirty, while in seven it was better.

Bricklayers

have experienced bad employment generally, but it has been moderate at Stockton, South Shields, Oldham, Stockport and St. Helen's; fair at Bootle and Coventry; improving at Bath, Swindon and Croydon. At Glasgow and Greenock it was worse than a month ago. A report from Leeds states that some men were migrating from that town to Lancashire, where some large mills were in process of erection.

Stonemasons

found employment much the same as compared with a month ago, and in England as compared with a year ago, but it was worse than a year ago in Scotland. Employment improved at Bristol, but at Dundee it was worse than a month ago. The strike of 716 quarrymen at Nantlle which began on December 4th and lasted forty-five days has been settled by the men accepting the proposed reduction of wages of 10 per cent. 1,500 Weardale limestone quarrymen have secured a small advance.

Carpenters and Joiners

With carpenters and joiners employment on the whole was worse than a month ago, the decline being chiefly in London and the Midlands, while in the Eastern Counties there was an improvement. The percentage of trade-union members unemployed at the end of January was 10.1, as compared with 9.6 in December and 11.6 in January, 1905.

Slaters and Tilers

found employment very bad in England and Ireland. Much short time was reported. A strike began on January 15th of about 400 slaters in eleven towns in Northumberland, Durham, Cumberland and Cleveland, Yorks, against a proposed reduction in wages from 10d. to 9½d. per hour. No settlement is yet reported.

Plumbers

With plumbers employment was slightly better in the Northern Counties but worse in every other district, the greatest decline being in the Midlands and Ireland. Compared with a year ago there was considerable improvement in the Northern Counties and Ireland, and some improvement in Scotland, elsewhere there was a decline, which was most marked in London.

Plasterers and Painters

Employment with plasterers continued bad, and in Scotland was worse than a month ago, but with painters employment showed a general improvement as compared with a month ago. It was still generally bad, however, though fair at Bolton and Northampton, moderate at Birmingham, Dewsbury and Stalybridge, and fairly good at Stafford.

A joint conference was held last week at Newcastle between representatives of the Building Trade Employers' Association and the Newcastle and Gateshead and South

Shields branches of the National Association of Operative Plasterers, with a sub-committee of the Newcastle Education Committee acting as intermediary, when several alterations in the working rules governing the plasterers' trade were agreed upon, the revised regulations to come into operation from Monday last. It was mutually agreed that the standard rate of wages should be 9½d. per hour.

A. Done by bricklayers.

The Month's Trade.

(Reports by our Special Correspondents.)

STONE, GRANITE AND MARBLE TRADES.

We have heard on all sides that these industries are depressed, but quarryowners and stone and marble workers look forward to a revival of trade in the near future. The labour returns of the Board of Trade again show that employment in January was slack, as it has been for many months. As regards limestone, the reports for January show, however, that employment was good in Cumberland and Weardale. Employment was moderate in the Buxton district, where the weather interfered somewhat with work, but work was dull in the Plymouth district. It was dull also at the Bath stone quarries in the Bristol district, being about the same as a month ago and a year ago.

In other stone January showed that employment was moderate in the building-stone quarries in the Rowsley district and was slightly better than a year ago; employment was also moderate at Barnsley, but slack at Normanton. In Forfarshire employment continued bad, and short time was worked.

With granite workers employment continued dull on the whole in Aberdeenshire, and much short time was worked. It was bad also in Devonshire and Cornwall.

The monthly returns for imports of stones, slabs and marble, rough, hewn and manufactured, for the month ending January 31st, 1906, as compared with the same month in 1904 and 1905, are as follows:—

Tons.			Value.		
1904.	1905.	1906.	1904.	1905.	1906.
112,113	88,585	109,803	£125,429	£99,324	£122,174

Portland Stone.

The production of Portland stone on the island in Dorsetshire has, since the beginning of the year, been of a very fluctuating character; high winds, rain and gales such as are seldom experienced in London have prevented the steady output of this famous building stone. There are indications of a distinct falling-off in the sale of Portland stone, which appears to have been one of the last in the stone trade to feel the effect of the general depression in the trade. But Portland stone has been looked upon so much as an ideal stone for London that there is little doubt that when building schemes reach fruition it will again be in great demand. The output has grown with the demand, as the enormous Government buildings which have been erected, and are now being erected, in London have set the pace, and also the standard in both quality and workmanship. The Combefield Quarries, one of the largest in the island, are in full work, but those to the south of the cliff only work intermittently in consequence of the weather. Kingbarrow, from which the stone was taken for the new War Office, is not so busy, but we understand that the stone from this district has been booked for several large contracts.

Bath Stone.

The Bath stone trade was in a more or less depressed state throughout the whole of last year, and so far shows little signs of a revival. It is satisfactory to note that the principal demand is for those quarries which have created for themselves a name and standing for their high quality and soundness. The Monk's Park Quarries and the Box Ground are having a large share of the trade, while the masonry works at Box and Corsham are producing finished work in quantity equal to the corresponding month of 1905. There never was a time when greater care was exercised in the production of Bath stone of an approved quality, and the firms engaged in this industry look forward to increased trade when the turn of the tide comes. The prospects for the present year

are more favourable. Many large buildings are in contemplation, and numerous applications are daily received from contractors and builders for prices of block and stone worked ready for fixing. Bath stone is well known all over the country for its free working and handsome appearance, and durability as a weather stone if used on its proper bed. Large stocks are on hand of summer-dried stone ready to meet any emergency. A new quarry has been developed at Gastards, adjoining Monk's Park, which will largely add in the future to the output of the Bath stone series.

Marble.

The depression in the money market naturally affects the marble industry closely, because building owners are first to substitute other forms of decoration and imitations for such expensive work. The largest marble contracts of late have been the Lambeth municipal buildings, the Victoria Memorial and the Victoria and Albert Museum. These of course, are public works, and private persons and companies do not seem able yet to afford to use this most beautiful material to any large extent.

Granite.

Granite seems to be increasingly used in buildings, but much of the work is going to Norway, which is certainly supplying a good deal that is good. Aberdeen continues to hold a front place among native granites, but we hear of attempts being made to develop Irish and Cornish granite. New works in Galway will shortly be entering the market with very fine grey and red varieties. When trade revives, granite workers look forward to a large share of work.

THE SLATE AND TILE TRADES.

The slate trade still continues to be in a state of great depression. With the exception of Lancashire, South Wales and the neighbourhood of Leicester, no improvement seems to be taking place, and there appears to be little immediate prospect of better times during this year. Most of the quarries in Wales are at present working on short time, and with few exceptions there is little difficulty in obtaining supplies readily, but there is great difficulty in obtaining the larger sizes of Welsh slates, especially 24ins. by 12ins., unless considerable notice is given of requirements. The demand for this slate is very great in South Wales and Ireland, and it is to these localities that the bulk of the output of this size is sent.

In London and the south-eastern counties there seems to be a more general depression than in most other districts in England, especially in the country. There is a considerable demand at the moment for Westmorland slates in the northern counties, several large municipal buildings where these slates have been specified being now nearly ready. The demand for this roof covering in the London district has been very small, one reason being that the area covered with slates has decreased considerably during the past few years in favour of lead or asphalt flats, and the tendency in future would seem to point to a reduction rather than an increase in this respect.

The import of foreign slates has decreased very considerably during the past three years, the imports in 1903 having amounted to about 120 M tons, in 1904 to 87 M tons, and in 1905 to 72 M tons. A very large proportion of these slates find their way into the London market, most of them being used for speculative work in the suburbs. In spite of the large decrease in the import of these slates (which are obtained chiefly from France) it is still difficult to find a lucrative market for Welsh slates of any description.

The demand for tiles and tiling is much

better than in the case of slates, and there seems at the present time to be a distinct revival in favour of tiled roofs. The works producing hand-made sand-faced tiles appear to be holding their own, and they are still able to retain prices, whereas the prices for slates generally have fallen very considerably during the past year. The tiling works are able to be generally busy, and in certain instances are delaying dispatching consignments.

The tiles from the Broseley and Staffordshire districts seem most in favour. The prices are reasonable as compared with the country-made tiles. This is accounted for by the regularity of their make and the decrease in the cost of labour in making them, and a practical immunity of breakage in transit, and, as an instance, prices for these tiles compare favourably in the Brighton and Eastbourne districts with those in the immediate district. There is an increasing demand for old tiles, which in most cases there is great difficulty in supplying. There is no regular market for these, and country builders who may be fortunate in possessing them in any considerable quantities are not usually disposed to part with them on any terms.

Labour.

The labour market so far as slaters and tilers are concerned is fairly free, and the relations between employer and employee are on the whole satisfactory. Of late there has been a dispute between the masters and the men on the north-east coast over the question of a reduction in wages, a strike having lasted about five or six weeks. We understand, however, that a settlement has now been effected.

THE CLAYWORKING INDUSTRY.

The clayworking industry is very depressed at the present time. Bricks are so integral a part of the general building trade of the country that the limitation of building throughout the country has been felt very much by the manufacturers. The result has been excessive competition for the small volume of trade doing, and the consequence is that there is little profit to be made—the business is like giving two half-pennies for a penny. The common brick trade, such as in Flettons and stocks, is in a serious state, and it will be some time before it revives. The glazed brick trade is almost as bad. Flettons have now displaced stocks for general cheap work, and the latter are now being used mostly for facings. Makers find difficulty in getting rid of their inferior qualities, and builders are forced to pick the stocks themselves if the specifications require them. A few makers have been smart enough to spend their energies in producing porous clay fire-resisting floor and partition blocks and bricks, and have secured a good many large and remunerative orders recently. Terra-cotta is likewise largely unremunerative, except perhaps the glazed kind, *i.e.*, faience, which is coming more extensively into use in our smoky towns, for which it is most suitable. Glazed tiles are naturally likely to be increasingly used. Glazed sanitary ware is in less request than some time ago, but this is also a growing feature. Comparing the general level of wholesale prices for bricks in recent years with the Board of Trade index number of 100 for the base year of 1871, we see a general decline. The mean for 1871-1880 was 99.5, for 1881-1890 it was 84.9, for 1891-1900 97.3, for 1901-1905 92.21, for 1903 and 1904 90.09, and for last year 88.5.

The Board of Trade returns for January show that employment in the brick and tile trades generally was slack, and about the same as for several months past. It was still good, however, at Exeter, and fair in South Wales.

THE PORTLAND CEMENT TRADE.

Portland cement manufacturers have not yet shared in the briskness which prevails in the iron and general metal trades.

In the year 1900 a great change took place in the Portland cement trade. Some thirty manufacturers, having an annual capacity of nearly 1,500,000 tons, combined together, and now trade under the title of the Associated Portland Cement Manufacturers (1900), Ltd. It is an open secret that on the formation of this company consumers very generally became apprehensive as to the prices they would be called upon to pay for Portland cement in the future, thinking that the combine would adopt the policy which is so general in other directions of making use of their power to force prices upwards. So pronounced was this apprehension that many important buyers in this country, including one of the leading Government departments, actively concerned themselves in arranging for their future supplies from the Continent, but these fears were soon allayed, and consumers now generally recognize that new departure was telling to their interest. The exchange of ideas of managers controlling various works have naturally resulted in various economies taking place, coupled with a substantial improvement in quality, while the fact of one large organization working under one office has also tended towards the same result. This has benefited the consumers, as the company has by their efforts been able to reduce their prices during the five years by several shillings per ton.

A marked feature in the trade during the past few years has been the importation of large quantities of Belgium natural cement into this country, but owing to the introduction of the British standard specification, and a general awakening on the part of the consumers to the inferiority of the natural product, these importations have largely diminished, and it may now be safe to say that this indifferent and unreliable product is only used surreptitiously or for inferior work. In these days the Portland cement industry is not entirely dependent on the building trade, as concrete in which cement enters so largely is every year becoming more popular not only for building but for general constructional and civil engineering works, and this, with the expected increase of trade, leads manufacturers to expect better times.

Perhaps the brightest feature in the outlook, apart from the improved general trade position, is the growth in the number of uses to which Portland cement is now being put in this country. In this respect it is notorious that we have for a long while lagged behind other countries, notably the United States, France and Germany, but our engineers and architects appear at last to have begun to realize the advantages of reinforced concrete as a constructional system, and in the near future very great developments in this direction may be expected.

There are further very large schemes on the tapis in various parts of the world, such as the Grand Trunk Pacific Railway of Canada, various railways in the Argentine, Dock extensions in Chili; and in Europe there is a new Baltic canal in contemplation, also an expenditure of £10,000,000 on the Antwerp Docks, which together with the intention of many of our harbour authorities to provide increased accommodation for the very large mercantile boats that are now built, should lead to a very large consumption of cement.

It is the knowledge that these various civil engineering schemes are in contemplation, and the expectation that spring will bring an increased demand for the general building and contracting trades, that produces the feeling that exists amongst manufacturers that prices have now touched bottom, and that within a few months we shall see enhanced values.

THE TIMBER TRADE.

The Board of Trade reports that employment in January with mill-sawyers and woodcutting machinists continued dull, but was better than a year ago. Trade unions with a membership of 4,422, showed 231 (or 5·2 per cent) unemployed at the end of January, compared with 6·6 per cent. at the end of January, 1905. Employment was reported as good at Coventry and Wellington; as fair at Birmingham, Lancaster, Liverpool, Preston, Huddersfield, Reading, Edinburgh, Aberdeen and Glasgow; as improving in the Shields district and at Sunderland and Loughborough; and as moderate at Oldham, Bradford, Chorley and Darlington.

The London Market.

We have published a monthly report on the timber trade for some time now. January's news have already been given in our columns, and the full February reports are not yet to hand. The mid-monthly report with regard to hardwoods, from Messrs. C. Leary & Co., states that the consumption of mahogany is satisfactory, and with restricted supplies a practical certainty for the present values will doubtless tend to harden; with the exception of moderate quantities of Honduras and Cuba, first hand stocks are almost non-existent.

As regards cedar, Mexican, Honduras and Panama descriptions still command high prices. Cuba and Trinidad are in excellent request, and further shipments are wanted.

The Liverpool Market.

Builders' timber has been in good demand since the disturbance caused by the general election subsided. Much has been sent inland by rail. A considerable number of deals have been supplied to large users at Earlestown, Newton-le-Willows and the vicinity, where engineering and railway wagon work are carried on. Deals, flooring boards and other builders' woods have also been sent in some quantity to towns on the borders of Lancashire and Cheshire, between Warrington, Stockport and Ashton-under-Lyne, when important industries and some large new buildings are in progress. The prospects for the spring, so far as consumption is concerned, are good at present.

The regular "liners" have brought steady, though moderate supplies of these woods from St. John's, which have gone far towards counterbalancing withdrawals from stocks. The aggregate stock of New Brunswick spruce deals is slightly greater than a year ago while that of Quebec deals is less, though quite ample for demands which are likely to arise. The arrivals of Quebec deals have been small; much less than the extent of the deliveries from stock. The difference has not, however, any unfavourable significance as regards supplies and prices in the near future, the stock in hand being sufficient to serve for six months' consumption on the basis of recent deliveries. Baltic red deals and flooring boards have come to hand in small quantities, but fair consignments of boards have gone direct to Manchester. The arrivals of Norway boards at Liverpool have also been small. Stocks of Baltic red deals and boards at Liverpool are more than one-third greater than a year ago, and practically equal in quantity to what they were in the early part of 1904. The stock of Norway boards is slightly less than a year ago. From the United States, planks and boards have come to hand freely and large stocks of these are now held at Liverpool. Values of fair-to-prime quality wood are weak; poorer qualities are cheaper.

A good demand, small stocks and light arrivals have combined to make the position of pitch-pine strong. Higher prices are looked for and are talked of. Hewn timber has been in very fair demand, wood of superior quality finding a ready sale. The

present stock of hewn is equal to two-thirds of the stock held at the corresponding date last year. Sawn has come to hand in larger quantities but the deliveries have been large, and much in excess of arrivals. The stock is consequently very small, comparatively, being less than one-third of what it was in the early part of 1905 and less than one-fifth of what it was early in 1904. Prices are consequently higher and holders are very firm in their demands. Recent sales have been at the rate of about 1s. 6d. to 1s. 10d. per cub. ft. for sawn. Deals and boards have also been in good demand, and though recent arrivals have been on an average scale; stocks are light. These woods are, therefore, dearer; planks ranging from 1s. to 1s. 2d. per cub. ft., and boards of first quality from £16 10s. to £18 10s. per standard. British Columbian and Oregon pine has arrived in large quantity, and the stock is now heavy, more than double that of a year ago. Values have, however, kept steady.

Oak of United States growth is held in fair quantity, though the stock is smaller than that held last year. The consumption has not been on a large scale, and prices continue at the recent low figures. Planks have been in large demand, much in excess of arrivals, and the stock is now small in comparison with recent deliveries. Prices are well maintained, from 1s. 9d. to 2s. 1d. per cub. ft. being the range in late transactions.

Supplies of Java teak have come to hand somewhat freely, and adequate stocks are now held, the consumption only being on a moderate scale. From £13 to £20 per load has been the recent range of values. Planks have been in larger demand, but present stocks quite ample. Prices are very firm.

Auction sales of mahogany held by Messrs. Farnworth & Jardine on February 9th were marked by a readiness to take up lots of useful wood, which spoke well for business in general.

These and the ordinary sales of builders' timber showed that the trade at Liverpool was in a very healthy state.

THE GLASS TRADE.

The glass trade is better than a year ago, and is fair so far as relates to the building industry. The election interfered somewhat with trade. Figured rolled and plate and wired glass is increasingly used nowadays. The last is an excellent fire retardant, and will no doubt be widely adopted in future for commercial buildings. The figured glass is now being ornamented in colours, up to three different colours being combined in one sheet. This picks the pattern out distinctively and should meet with favour. The Board of Trade report that employment in January with sheet-glass makers and flatteners at St. Helens continued good. It was bad, and worse than a month ago, with pressed-glass makers in the Tyne and Wear district. With plate-glass bevellers and silverers at Birmingham it continued fair. Employment was good, and better than a month ago, with glass blowers in London. From the various glass works in Belgium the United States is continuing to be a heavy buyer in plate glass. England is sending orders with some briskness, while the Far East and Australia export trade is very favourable. Orders are, however, decreasing, especially for the inferior qualities of glass, and factories are suffering the effects of over-production. To counteract this a scheme has been proposed for the establishment of a central bureau for receiving orders which will be submitted to the manufacturers by the bureau and eventually given to the lowest bidder. The bureau would sell direct to the customer with a profit, the latter to be divided among all manufacturers supporting the bureau. In other words, competition among the manufacturers would remain free, but would be exercised to their own profit.

THE METAL TRADES.
Past, Present and Future.

After a long period of quiet trade, dismal prices and prospects which seemed to justify the pessimism which had become pretty deeply rooted in our minds, a faint evidence of change made itself felt last year, just in time to exert an influence on the twelve months' trade.

No order of things, however good or however bad, can continue indefinitely, but when the vagaries of time bring round a prolonged period of dulness our perspective becomes limited and our efforts circumscribed, and this tendency always results in our becoming acclimatized to prevailing conditions and ceasing to expect better things.

Gradually, as the year drew on, we were obliged to admit that the clouds were dispersing, and brighter tints were bearing upon the perspective. The promised boom has now come about with unmistakable vigour, and its influences have spread far and wide.

Confining ourselves to iron and steel products, which are gradually becoming a dominating factor in the building trade of this and all other progressive countries, the consistent advance in prices and increased output from the first indication of activity to the present day are important things to note.

We are not interested in the dead year or even the past month, but their influences upon to-day's affairs are not to be lightly passed by.

The questions which come foremost in importance are: Has the high-water mark been reached? Is the present congestion of many sources of supply and the consequent healthy prices and slow deliveries likely to continue for long? These questions are difficult to answer, but certainly there appears to be a tendency to steadiness of prices throughout, and in odd instances just a suggestion of falling-off in prices. This latter, however, is not sufficiently significant to be regarded seriously.

In present circumstances it would be futile to prophesy, but the general complexion of affairs gives the idea that prices all round will continue to advance for the present, so far as iron and steel are concerned, without necessarily implying that the advances will show anything startling.

Galvanized sheets, from more causes than one, have shown a steady increase from the commencement of the healthy period, rising from £10 to something in the region of £13; the advance has been consistent, and maintained pretty well without a break. During the past few weeks, however, the movement has been in a downward direction, but the change has only been slight. Makers have considerable orders on their hands, although they are not coming forward so quickly at the present moment. Prospects are, however, good, and it is fairly safe to assume that we need not look for any material shading of prices in the near future.

As regards lead, recent consumption has not been remarkably rapid. Prices are, of course, still at a pretty high pitch. Soft foreign stands at something like £15 15s., and English but slightly higher; pipes £19, and sheets £18 10s. These of course show a very fair shading off, but do not necessarily indicate a consistent movement.

In copper there is not a particularly hopeful tendency, and prices have also been slightly shaded latterly, but nothing considerable; touching sometimes £77. The current price of £78, therefore, shows an advance of £10 over the prevailing figure this time last year. This market is always more or less sensitive, and rather more than less at the present moment, and those affected will watch its movements in the near future with particular interest.

English Iron and Steel.

English manufactured iron and steel, being the most familiar products, have of course

displayed the most obvious advance over the past twelve months. Taking Staffordshire marked bars as a criterion, the present price of £9 represents an enhancement of just 20s. over the price of a year ago. A corresponding advance has taken place in "common" bars, which are now pretty firm at £7 5s. These prices have not changed much during the past few weeks. New business has not been very great, but manufacturers have plenty of orders on their books, and there are no indications of any falling off in trade in the near future. The trade in rolled steel for constructional purposes continues to be brisk. Makers have plenty of orders on their hands, and good enquiries continue to come forward.

In Scotland the increased activity in the shipbuilding trade during the last few weeks has had the usual effect of improving prices. All makers are fully engaged and the income of business is steadily maintained. Middlesbrough has been affected from the same cause, and the demand for all classes of manufactured steel continues steady, and makers are kept pretty well employed.

Foreign Steel.

Various circumstances have combined to make the building trade of this country look to Germany and Belgium as important sources of supply. Comparatively cheap production and easy freights have enabled the manufacturers of those countries to put their material on the English market in increasing quantities. The trade, conducted through the medium of the English merchants, has reached considerable dimensions, and prevailing conditions on the Continent are deserving of attention. Steadier markets are now the order of the day, as a result of the creation and successful organization of the export sale arrangements in Germany in so far as rolled steel joists and channels are concerned. Belgium has followed the example of her stronger neighbour in these very important products, and its organization becoming complete, a degree of co-operation between the controllers of the two markets has been the result. To-day, and we may safely assume for some time to come, the prices of German and Belgian joists will not enter into mutual conflict to the advantage of the British consumer. At the same time it is only just to say that although a marked and steady increase has taken place since this time last year, there is nothing absolutely crushing in to-day's market prices. During the period mentioned the advance in prices of Basic steel joists for a fair specification has been from about £4 16s. to £5 16s. per ton c.i.f. Thames, or equal East Coast ports. The tendency is of course still an upward one, and works are full up with orders. Advances may perhaps be looked for, although not of very alarming character.

Merchants on this side who keep well in touch with the progress of events on the

Continent are handling large quantities of joists rolled to British standard shapes, some German works having turned rolls to the precise dimensions laid down by the Engineering Standards Committee. These include pretty well all the sections up to 12ins. high, and some of the heavier shapes.

Basic steel angles and tees stand on a somewhat different footing to the heavier sections, and the tendency is not in the direction of steadiness of prices. However, since this time last year prices have kept more or less in sympathy with the general advance, and have in fact shown latterly a somewhat rapid development. The larger demand at home has had something to do with this, and the mills are heavily booked with orders. The last twelve months has seen an increase in the price of angles from £5 5s. to £6 12s. in the Thames, and tees from £5 11s. to £6 17s. in the Thames or equal East Coast ports.

Needless to say, to-day's prices in these lines do not show up very well in competition with English prices in many parts, especially to consumers who are well situated as regards freights for the latter. Forward bookings, however, are still being made in Continental bars, and many buyers, not in immediate requirement, are content to watch and wait for the events of the near future.

THE IRONMONGERY TRADE.

The builders' ironmongery trade is very bad, and although every one is looking forward to the promised revival in the building trade it will be some time before the ironmongery trade receives much stimulus from speculative building, which forms such a large portion of the demand. We have heard on all sides of the scarcity of orders, and the Board of Trade returns for January are also depressing. Employment in January at Wolverhampton continued bad in the lock and latch trade, much short time being worked. It was fair on cast-iron hollow-ware, and good on iron fences and hurdles. In the hollow-ware trade it was slack at Sheffield, but continued to improve at Birmingham and West Bromwich. In the edge-tool trade it was fair at Sheffield, Birmingham and Wolverhampton. Employment in the stove, grates, &c., trades was slack at Sheffield and Rotherham, fair at Falkirk and Glasgow, and better than a month ago at the latter place. Employment with nut and bolt makers continued good in Darlaston and Winlaton, and fair at Birmingham and in South Wales. With wire nail, shoe rivet, and cut nail makers at Birmingham it continued fair; at Black Heath with rivet and nail makers it was fairly good.

THE WALLPAPER TRADE.

The wallpaper trade has continued fairly good. Foreign competition is not a very serious amount, although imports are more than last year. Our exports have, however, also increased.

THE PAINT TRADES.

The paint trades are fairly good considering the time of year. As regards materials, the returns for imports and exports

for the month ending January 31st, 1906, as compared with the same month in 1904 and 1905, are as follows:—

	IMPORTS.					
	1904.	1905. Cwts.	1906.	1904. £	1905. Value.	1906. £

Complete List of Contracts Open.

VERY nearly all building contracts are nowadays obtained in competition, and immediate and full information regarding contracts open for tendering is so important (indeed it is almost essential) to every contractor that we propose to devote special attention to the provision of such news. Each week we shall publish full information upon all contracts open in a way which no other building journal attempts. No pains will be spared to render this list accurate in its information, and inclusive of the latest news from all parts. News of large contracts abroad open to international competition will also be a special feature.

[Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of *bona fide* tenders.]

BUILDING.

Mar. 1. Manchester.—*Stable, male and female conveniences, &c.*, for the Parks Committee. Drawings may be seen and specification and bill of quantities obtained at office of City Architect, Town Hall, upon payment of £1 rs. Sealed tenders, enclosed in the official envelope, to W. Henry Talbot, town clerk, Town Hall, Manchester, by 5 p.m. on Mar. 1.

Mar. 1. Shrewsbury.—*County buildings*, for the County Council. Drawings and specifications may be seen and quantities obtained at County Surveyor's Office, Shrewsbury, on payment of £3 3s. Sealed tenders on the form supplied, endorsed "County Buildings," to A. T. Davis, county surveyor, Shirehall, Shrewsbury, by Mar. 1.

Mar. 1. Accrington.—*Public library*, for the Corporation. Plans and drawings may be inspected and forms of tender, with specifications, general conditions, bill of quantities, &c., obtained on application to the architect, William J. Newton, M.S.A., A.M.I.C.E., borough engineer, Town Hall, on payment of £5. Sealed tenders, endorsed "Tender for Public Library," to be delivered to A. H. Aitken, town clerk, Town Hall, Accrington, by Mar. 1.

Mar. 1. Llanelli.—*Re-modelling of Park Street School Buildings*, for the Education Committee, in accordance with plans and specification prepared by William Griffiths, F.S.I., architect, Llanelli, which can be seen at the Education Office, Llanelli. Sealed tenders, marked "Tender for Re-modelling Park Street School Buildings," to Ior W. Watkins, clerk of committee, Education Office, Llanelli, by noon on Mar. 1.

Mar. 2. Navan.—*Banking premises*, for the Belfast Banking Co., Ltd. Drawings and specification may be inspected at the architects' offices, where bill of quantities may be obtained upon deposit of £3 3s. Sealed tenders, endorsed "Tender for Belfast Bank, Navan," to Anthony Scott & Son, architects, 34, Lower Sackville Street, Dublin, by Mar. 2.

Mar. 2. Stockport.—*Three shelters*, for the Parks Committee. Plans and sections may be seen and bills of quantities, specification and forms of tender obtained from Borough Surveyor, Stockport. Tenders sealed, and endorsed "Tenders for Shelters, Vernon Park," to John Atkinson, A.M.I.C.E., borough surveyor, Borough Surveyor's Office, Stockport, by Mar. 2.

Mar. 2. Devizes.—*Twelve cottages and offices, &c.*, in Gain's Lane, for the Urban D. Council. Plans and specification may be seen and copy of bill of quantities obtained from Borough Surveyor's Office, Devizes, on payment of £1 rs. Sealed tenders, endorsed "Tenders for Cottages," to F. G. Billingham, borough surveyor, Town Hall, Devizes, by noon on Mar. 2.

Mar. 3. Dalraddy.—*Two workmen's houses* at Dalraddy Loop, near Aviemore, for the Highland Railway Co. Plans and specifications may be seen with William Roberts, engineer-in-chief, Inverness, or with the station agent at Aviemore. Sealed tenders, marked on the outside "Houses, Dalraddy," to Robert Park, secy., Highland Railway Co.'s Offices, Inverness, by Mar. 3.

Mar. 3. Glasgow.—*Public conveniences* in (a) Nelson Street, S.S., and (b) Rutherglen Road, for the Corporation. Specifications and forms of offer may be had on application at the Office of Public Works, City Chambers, 64, Cochran Street. Sealed offers, marked outside "Offer for — Convenience," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, by Mar. 3.

Mar. 3. Dalkey.—*Working-class dwellings*, for the Dalkey Urban D. Council. Plans and specifications may be seen at the Council's Office, Town Hall, on any weekday between 10 and 2. Tenders, including the names of two solvent sureties, to be under cover and marked "Tenders for Dwellings" to J. P. Gahan, clerk of the Council, Town Hall, Dalkey, by Mar. 3.

Mar. 5. Sheffield.—*Extension of the Training College*, Collegiate Crescent, for the Education Committee. Specifications and drawings may be seen and copies of the bills of quantities obtained from Gibbs & Flockton, 15, St. James's Row, Sheffield. Tenders to John F. Moss, secy., Education Committee, Sheffield, by Mar. 5.

Mar. 6. Clitheroe.—*Public slaughter-houses* to be built at Fouliskeys. Plans and specifications may be seen and quantities obtained at the Borough Surveyor's Office. Tenders sealed, and endorsed "Tender for Slaughter-houses," to be delivered at the Town Clerk's Office by noon on Mar. 6.

Mar. 6. Alfreton.—(a) *Cemetery lodge, Leabrooks*; (b) *steam-roller house and cart-sheds at Cotes Park*. Plans may be seen and copies of the specification and bills of quantities obtained from E. Houlton, surveyor, on payment of £1 for each set. Tenders enclosed in sealed envelopes, and endorsed "Cemetery Lodge" and "Cart-sheds" respectively, to E. Houlton, surveyor, King Street, Alfreton, by noon on Mar. 6.

Mar. 6. Blackpool.—*Additions and extensions* to the Victoria Hospital in Whitegate Drive. Plans can be seen and bills of quantities obtained on application to the architect on deposit of £1 rs. Sealed tenders,

endorsed "Hospital Extensions," to R. B. Mather, hon. architect, 34, Birley Street, Blackpool, by Mar. 6.

Mar. 6. Witton.—*Alterations, repairs, &c.* at Witton Hall for the Guardians. Drawings and specifications can be seen, and the building inspected, on application to the Caretaker, at the Hall. The person whose tender is accepted will be required to pay to his workmen not less than the recognised rate of wages current in the district. Sealed tenders must be sent to John North, clerk to the guardians, Union Offices, Vauxhall Road, Birmingham, by noon on Mar. 6.

Mar. 6. London, E.—*Alterations to kitchen* of the Bromley Asylum, in accordance with plans and specifications prepared by J. & W. Clarkson, architects, 136, High Street, Poplar, E. Drawings and conditions of contract to be seen at the offices of the architects and a copy of specification and form of tender obtained upon payment of £5. Tenders sealed, and endorsed "Tender for Alterations to Kitchen," to Walter R. Foskett, clerk to the managers, Devon's Road, Bromley-by-Bow, London, E., by 10 a.m. on Mar. 6.

Mar. 6. Belfast.—*Four one-storeyed pavilions*, laying water mains, constructing drains, walks, tanks, &c., erecting a two-storeyed hospital for a mortuary, and also for additions and alterations to Administrative Building, at "The Abbey" Sanatorium, for the Guardians. Copy of schedules of quantities and forms of tender from S. C. Hunter, building surveyor, Scottish Provident Buildings, on payment of 6d. Tenders made out on the forms, and endorsed "Abbey," to be lodged in the Tender-box, Boardroom, Union Workhouse, Belfast, before noon on Mar. 6.

Mar. 7. Kinsale.—*Completion of three unfinished labourers' cottages*, which are situated in the townland of Horsehillbeg, Horsehillmore North, and Shanavally, respectively, for the Rural D. Council. The contractor shall remedy all defective work, including defective chimneys, and have the entire completed before June 1. The amount for each cottage must be given in tender. Tenders will be received by John Murphy, clerk of the council, Council Office, Kinsale Workhouse, by 11 a.m. on Mar. 7.

Mar. 7. Stamford.—*Buildings*:—(1) Pulling down old buildings, excavation, brickwork and stonework; (2) carpenters' and joiners' work; (3) slaters' work; (4) plumbers and glaziers' work; (5) plasterers' work, and (6) painters' work. Required in connection with the erection of buildings at the town hall. Drawings may be seen and specifications and bills of quantities with form of tender obtained on application at the office of Frederick R. Ryman, borough engineer, on payment of £1 each for Nos. 1 and 2 and 20s. each for Nos. 3, 4, 5 and 6 specifications. Tenders, endorsed respectively "Tender for Brickwork, Stonework, &c., Carpenters' and Joiners' Work, Slating, Plumbing and Glazing, Plastering and Painting," to Charles Atter, town clerk, Town Clerk's Office, Stamford, by Mar. 7.

Mar. 8. Little Eaton.—*School and chapel*, for the United Methodist Free Church. Plans and specifications may be seen and bills of quantities had on payment of £1 rs. Tenders to be sent to A. E. Eyre, architect, Almond Villas, Almond Street, Derby, by Mar. 8.

Mar. 8. London, E.C.—*Lighthouse, dwelling, &c.*, at Strumble Head, for Trinity House. Plans may be inspected and forms of tender and specifications obtained either at the Trinity House, London, between 10 and 5, or on application to the Officer-in-charge, Coastguard Station, Fishguard, Pembrokeshire. Copies of surveyor's quantities may then be obtained on application to Corderoy, Selby & Corderoy, 21, Queen Anne's Gate, Westminster, London, S.W. Tenders, sealed and marked outside "Tenders for Strumble Head Lighthouse," to A. Owen, secy., Trinity House, London, E.C., by Mar. 8.

Mar. 8. Dorchester.—*Works* for the Town Council as follows:—(1) For renovating and improving the south and west fronts of the Town Hall. (2) For alterations and additions to the Corn Exchange. Plans and specifications may be inspected at the Borough Surveyor's Office during usual office hours, where also forms of tender can be obtained. Tenders, made out on the proper form, enclosed in separate sealed envelopes and endorsed (1) "Tender for Town Hall Repairs," and (2) "Tender for Alterations to Corn Exchange," must be sent to A. G. Symonds, Town Clerk, 11, South Street, Dorchester, by Mar. 8.

Mar. 9. Wenaston.—*Enlargement of Wenaston Council School*, for the East Suffolk County Education Committee. Drawings, specification and form of contract deposited at Wenaston School, in charge of the Managers, and application for permission to inspect same should be made to Wallace Ellis, Wenaston, corresponding manager. Tenders on the prescribed form in sealed envelopes, endorsed "Tender, Wenaston School," to W. E. Watkins, secy., White House, Tower Churchyard, Ipswich, by Mar. 9.

Mar. 10. Bakewell.—*Extension of board room and out-buildings*, and steam boiler and heating apparatus for the guardians. Plans and specifications of the work are deposited at the office of the Board's Architect, E. M. Longsdon, Town Hall, Bakewell, and may be inspected at all reasonable hours of the day. The Architect will

supply a copy of the bill of quantities on deposit of 10s. (extensions) and 5s. (heating apparatus). Forms of tender may be obtained from the Architect. The person whose tender is accepted will be required to find sufficient security for the satisfactory completion of the contract. Tenders, properly sealed, and endorsed "Tender for Extensions, &c.," must be delivered to Alfred Hawes, clerk to the guardians, Union Offices, Bakewell, by 11 a.m. on Mar. 10.

Mar. 10. Salford.—*Alterations* at the Union Infirmary, Hope, near Eccles, also for laying drains and other sanitary works for the Guardians. Plans may be seen and bills of quantities obtained at the office of the Architect, Henry Lord, 42, Deansgate, Manchester, by payment of a deposit of £1 rs. Tenders must be delivered to F. Townson, clerk to the guardians, Union Offices, Eccles New Road, Salford, by 9 a.m. on Mar. 10.

Mar. 10. Leeds.—*Police-station, &c.*, for the Watch Committee of the Corporation. Plans and specifications to be seen, and bills of quantities, together with the general conditions of contract and forms of tender, obtained at the offices of William H. Thorp, F.R.I.B.A., architect, Phoenix Chambers, South Parade, Leeds, on payment of £1 rs. Tenders, endorsed "Tender for Meadow Lane Police-station," to Robert E. Fox, town clerk, Town Hall, Leeds, by Mar. 10.

Mar. 10. Prussia Cove.—*Alterations and additions* at Trenalls Farm, also additions and alterations to King's Cottage, Prussia Cove, for the proprietor, L. W. F. Behrens, of Prussia Cove. Drawings and specifications may be seen at the office of the architect, Oliver Caldwell, F.R.I.B.A., Victoria Square, Penzance. Sealed tenders, endorsed "Tenders for Trenalls and King's Cottage," to be sent under separate cover to the same address by Mar. 10.

Mar. 12. Poole.—*Secondary School* at Seldown, Poole, for the Education Committee. Drawings and specification may be seen and forms of tender, together with bill of quantities and other particulars, may be obtained from G. A. Bligh Livesay, F.R.I.B.A., architect, Fir Vale Chambers, Old Christchurch Road, Bournemouth, any day during office hours upon payment of a deposit of £2 2s. Sealed tenders in the envelopes provided, endorsed "Tender for New Secondary School," together with sealed priced bill of quantities, must be delivered to Charles Lisby, secretary, Fish Street, Poole, by noon on Mar. 12.

Mar. 12. Gobowen.—*School*, for the Elementary Education Department. Plans and specifications may be seen and bills of quantities obtained at the offices of Shayler & Ridge, architects, Oswestry, or F. H. Shayler, architect, 16, Pride Hill, Shrewsbury, on payment of £1 rs. Sealed tenders, endorsed "Gobowen Council School," to H. E. Wade, secy., 11, College Hill, Shrewsbury, by 11 a.m. on Mar. 12.

Mar. 13. St. Erith.—*Renovation, re-seating, new roof* and other alterations and additions to the Wesleyan Methodist Church, St. Erith. Drawings and specifications may be seen at the offices of the architect, Oliver Caldwell, F.R.I.B.A., Victoria Square, Penzance, by appointment. Sealed tenders, endorsed "Tenders for St. Erith Wesleyan Methodist Church," to be sent to the same address by Mar. 13.

Mar. 14. Warrington.—*New post-office*, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification and a copy of the conditions and form of contract may be seen on application to the Postmaster between the hours of 10 and 5. Bills of quantities and forms of tender may be obtained on payment of £1 rs. Tenders must be delivered to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., endorsed "Tenders for Warrington Head Post Office," before noon on Mar. 14.

Mar. 15. London, N.—*New blocks and additions*, for the Guardians of the parish of St. Mary, Islington. Further information can be obtained from William Smith, architect, 65, Chancery Lane, W.C., where also, on depositing £5, form of tender and copy of bills of quantities and conditions of contract can be obtained, and plans and specifications can be inspected until Mar. 2. Sealed tenders, endorsed "Tender for Works," addressed to the Guardians' Offices, St. John's Road, Upper Holloway, N., by 4 p.m. on Mar. 15.

Mar. 15. Feniscowles.—*Public elementary school* at Feniscowles, near Blackburn, for the Lancashire Education Committee. Plans may be seen and bills of quantities obtained from Henry Littler, county architect, 16, Ribblesdale Place, Preston, on payment of £2. Tenders, sealed and endorsed, to Mr. C. E. Bygrave, Union Offices, Cardwell Place, Blackburn, by Mar. 15.

Mar. 20. Great Wratting.—*Elementary School*, to accommodate eighty children. Drawings, specifications, and form of contract may be inspected at the Education Committee's Office, 5, Crown Street, Bury St. Edmunds, and at the office of A. Ainsworth Hunt, building inspector, Sudbury. Sealed tenders, endorsed "Great Wratting Council School," must be sent to F. R. Hughes, secretary to Education Committee, 5, Crown Street, Bury St. Edmunds, by Mar. 20.

Mar. 20. Haverhill.—*Addition of a Class-room*, to accommodate forty-six children, with a cookery-room built over, for the West Suffolk Education Committee. Drawings, specifications, and form of contract may be inspected at the office of the Education Committee, 5, Crown Street, Bury St. Edmunds, and at the office of A. Ainsworth Hunt, building inspector, Sudbury, Suffolk. Sealed tenders, endorsed "Haverhill Council School," must be sent to Fred R. Hughes, Secretary to the Education Committee, 5, Crown Street, Bury St. Edmunds, by Mar. 20.

Mar. 21. Bushey.—*Elementary school and cookery centre* at London Road, Bushey, for the Education Committee. Persons desirous of tendering for the work may see the drawings, specification, agreement, &c., at the County Surveyor's office, Hatfield, after Mar. 8, between 10 and 4 (Saturday 10 to 12). A copy of the schedule of works and prices (quantities) and a form of tender can be obtained at the County Surveyor's Office upon payment of £2 2s. Sealed tenders, endorsed "Tender for School, Bushey," must be delivered to Urban A. Smith, county surveyor, County Surveyor's Office, Hatfield, by 5 p.m. on Mar. 21.

Mar. 21. St. Albans.—*Additions and alterations* to the Priory Park County Council School, St. Albans, for the Education Committee. Persons desirous of tendering for the work may see the drawings, specification, agreement, &c., at the County Surveyor's Office, Hatfield, after Mar. 8, between 10 and 4 (Saturday 10 to 2). A copy of the schedule of works and prices (quantities) and a form of tender can be obtained at the County Surveyor's Office upon payment of £2 2s. Sealed tenders, endorsed "Tender for Additions and alterations to Priory Park C.C. Schools, St. Albans," must be delivered to Urban A. Smith, county surveyor, County Surveyor's Office, Hatfield, by 5 p.m. on Mar. 21.

April 2. Lytham.—*Elementary school* at Commons Lane, Ansdell, Lytham, for the Education Committee. Plans may be seen, and bills of quantities obtained at the office of the County Architect, Henry Littler, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered, sealed and endorsed, to F. H. Brown, Fyde Union Offices, Kirkham, by noon on April 2.

April 2. Penzance.—*Business premises*, in the Green Market, Penzance, for the Public Benefit Boot Co., Ltd. Drawings and specifications may be seen at the offices of the architect, Oliver Caldwell, F.R.I.B.A., Victoria Square, Penzance, by appointment. Sealed tenders, endorsed "Tenders for New Premises, Penzance," to be sent to T. J. Leonard, Queen's Road, Bristol, on or before April 2.

No date. Penarth.—*All Saints' Parish Church Rooms*, Penarth. For bills of quantities and to inspect drawings, apply J. Coates Carter, Bank Buildings, Cardiff.

No date. Swansea.—*Extensions and renovations* to the Mermaid Inn, Port Tennant, Swansea, for E. Evans Bevan, Neath. Plans and specification and bills of quantities may be seen at the offices of J. Cook Rees, architect, Neath, to whom tenders must be sent.

Sealed tenders, endorsed "Tender for Bridge and Road at Aberdare," to T. Phillips, clerk to the Council, Town Hall, Aberdare, by Mar. 10.

SANITARY.

Mar. 1. Nottingham.—Sewers, for the Works and Ways Committee. Drawings may be seen and copies of the specification, bill of quantities and form of tender obtained from Arthur Brown, M.I.C.E., city engineer, Guildhall, Nottingham, on payment of deposit of £2 2s. Sealed tenders, endorsed "King's Meadows Outfall Sewer," to Samuel G. Johnson, town clerk, Guildhall, Nottingham, by Mar. 1.

Mar. 1. Greenwich.—Underground convenience for both sexes on a site near the junction of Creek Road with Evelyn Street, Deptford, for the Borough Council. Copies of the drawings, specification and conditions (which are to be returned), forms of tender, and other particulars, obtainable at the office of the Borough Engineer and Surveyor, Town Hall, Greenwich Road, S.E., between 10 and 4 (Saturdays between 10 and 12), on deposit of £2 2s. Tenders, which must be made on the forms to be obtained at the Town Hall, must be sealed up and endorsed "Tender for Construction of Convenience," to Francis Robinson, town clerk, Town Hall, Greenwich Road, S.E., by noon on Mar. 1.

Mar. 1. Surbiton.—Reconstructing the combined drain belonging to Nos. 7 to 12, Woodside Villas, Ewell Road, for the Urban D. Council. Plan and specification and form of tender from William Nesfield, A.R.S.I., sanitary inspector, at the Council Offices during office hours, on payment of a deposit of 10s. 6d. Sealed tenders to Council Offices, Surbiton, by 10 a.m. on Mar. 1.

Mar. 1. Tillington and Castlechurch.—About 6,800 yds. of cast-iron and stoneware sewers, manholes and appurtenant works, for the Rural D. Council. Drawings may be seen and copies of the specification, bill of quantities and form of tender obtained from R. & W. Berrington & Son, engineers, Bank Buildings, Wolverhampton, on payment of £5 5s. Sealed tenders for each parish, endorsed "Tender for Drainage of Castlechurch" or "Tender for Drainage of Tillington," to William Morgan, clerk to the Council, Council Offices, 4, Martin Street, Stafford, by noon on Mar. 1.

Mar. 1. Guildford.—Surface-water drainage as follows, inclusive of all necessary manholes, gulleys and connections, outfalls, &c., for the Town Council:—318 yds. run of 36in. armoured concrete tubes, 209 yds. run of 30in. armoured concrete tubes, 204 yds. run of 30in. unarmoured concrete tubes, 170 yds. run of 24in. armoured concrete tubes, 213 yds. run of 24in. unarmoured concrete tubes, 915 yds. run of 18in. armoured concrete tubes, 791 yds. run of 18in. unarmoured concrete tubes, 613 yds. run of 15in. unarmoured concrete tubes, 1,808 yds. run of 12in. stoneware pipes, 1,233 yds. run of 9in. stoneware pipes. Plans and sections may be seen and copies of the specification, bill of quantities and form of tender obtained on application to C. G. Mason, A.M.I.C.E., borough engineer and surveyor, upon payment of £2 3s. Sealed tenders, endorsed "Tender for Surface-Water Drainage," to be sent to F. S. Miller, town clerk, Town Clerk's Office, Bridge Street, Guildford, by noon on Mar. 1.

Mar. 5. Yardley.—Construction of the following foul-water sewers and drains (mostly in bad ground and running sands), viz., 630 yds. of 15in. sewer, 288 yds. of 12in. sewer, 261 yds. of 9in. sewer, 330 yds. of 6in. house drains, together with manholes, lampholes, flushing chambers and other works appertaining thereto, in

accordance with plans, drawings, specification and conditions of contract, which may be seen on application to the Engineer and Surveyor, Arthur W. Smith, Council House, Sparkhill, near Birmingham, between 10 and 1 and 3 and 5 (Saturdays, 10 and 1). Specification, bill of quantities and form of tender can be obtained on payment of £3 3s. Tenders, endorsed "Re-sewerage of Stratford Road, Sparkhill," to be delivered to Francis Ladbury Thompson, clerk of the Council, the Council House, Sparkhill, near Birmingham, by noon on Mar. 5. The contractor whose tender is accepted will be required to pay his workmen not less than the minimum standard rate of wages in the district for each class of labour respectively, and to observe the recognized hours and conditions of labour generally, and shall forfeit to the Council the sum of £1 for each infringement of this clause and a further sum of £1 for each day such infringement continues after his attention has been called to it.

Mar. 5. Pembroke.—*Pater ward sewerage*, being a rearrangement of the penstocks and penstock chambers and lowering of the 30-in. cast-iron outfall pipes for a length of 300ft., and other works connected therewith, for the Borough Council. Drawings and specification can be seen and forms of tender supplied at the office of the Borough Surveyor, 37, Bush Street, Pembroke Dock, from 10 to 4, or by appointment. The borough surveyor will give intending contractors full particulars by letter of the scope and nature of the work. Sealed tenders to be delivered to the Town Clerk, Municipal Offices, Pembroke Dock, by noon on Mar. 5.

Mar. 10. Colchester.—*600 tons of best hand-picked Buxton or Derbyshire stone lime* for sewage precipitating purposes. The contract will commence on April 1, 1906, and expire on Mar. 31, 1907. Specifications and forms of tender can be obtained upon application to Herbert Good-year, A.M.I.C.E., borough engineer and surveyor, Town Hall, Colchester, to whom sealed tenders, endorsed "Tender for Lime," must be sent by Mar. 10.

MISCELLANEOUS.

Mar. 1. Birmingham.—*Supply of the following materials*, for the Interception Sub-Committee:—Iron and steel ware, timber, brushes and miscellaneous stores. The tender of any person or firm paying less than the minimum standard rate of wages current in the district will not be accepted. Specifications and forms of tender may be obtained on application to the Superintendent, Montague Street Wharf, to whom tenders are to be sent by noon on Mar. 1.

Mar. 2. Sheffield.—*Undermentioned labour and materials*, for the Corporation, for the year ending Mar. 25, 1907:—Asphalting (labour and materials) for two years; bricks: red, blue, square and radiated; castings for sewer and other work; cement and lime (including lime for sewage works); earthenware, pipes, blocks, traps, &c.; freestone and gritstone: flags, kerbs, setts, concrete flags, quarry sand, &c.; granite: kerbs, ringsmall, setts, &c.; limestone: lump and chippings; pitch, tar and creosote oil; slag; lump and shingle. Particulars and forms of tender may be obtained, and samples of materials and workmanship inspected, at the office of Charles F. Wike, city surveyor, Town Hall, Sheffield, on payment of the sum of 10s. Applications to be endorsed "Annual Contracts." Tenders enclosed in official envelope provided, and accompanied by samples, addressed to the Chairman of the Highway and Sewerage Committee, to be delivered at the City Surveyor's Office by 10 a.m. on Mar. 2. The contract will comprise the fair wages and conditions of labour clause which has been adopted by the Sheffield Corporation, particulars of which will appear in the specification.

Mar. 2. Bishop Auckland.—*Supply of the following materials and stores*, for the Rural D. Council:—Road metal, creosoted fencing, timber, cement, plate bricks, sanitary pipes, shovels, hacks, brooms, water grates, coal tar, oils, nails, scoria bricks, paint, fire bars, &c. Forms of tender and any further information from John Heslop, surveyor, Cockton House, Bishop Auckland. Tenders properly endorsed to Sam Adams, clerk to the Council, Union Offices, Bishop Auckland, by Mar. 2.

Mar. 3. Coventry.—*Supply of the following materials* during the year ending Mar. 31, 1907:—Broken road stone, granite kerbs, granite setts, stoneware pipes, castings and workmen's tools. Forms of tender and full particulars obtainable from the City Engineer's Office, to whom tenders, sealed and endorsed "Tenders for Materials," must be sent before 10 a.m. on Mar. 3.

Builders' Current Price List of Specialities.

WE have received numerous letters and verbal suggestions from readers pointing out the various difficulties they experience in ascertaining the cost of the many specialities employed in buildings. Their requirements range themselves under the following heads:—

- (1) A record of fluctuations in the price of specialities to be published more frequently than the yearly builders' price-books.
- (2) A list of new specialities with registered names which give no indication of their makers or agents, as well as of older goods still on the market.
- (3) A price list of new materials and goods which will serve to place such goods prominently before the attention of architects and contractors.
- (4) More direct means of inter-communication between buyer and seller.

Architects when preparing drawings and writing specifications require to know what goods are available, and their cost, while builders often have to prepare estimates hurriedly, without sufficient time to write for quotations. Estimating then becomes guesswork, and a contractor often learns his tender is out of the running, or else learns after he has obtained a contract that he is bound to lose on certain items.

Yearly price-books have been published with the idea of offering a ready means of consultation for estimating purposes. These are no doubt valuable for roughly approximating prices of goods, but are quite unreliable for practical estimating, because the prices of specialities fluctuate so quickly.

We believe this list will meet these requirements. Our space is restricted, but in future numbers the list will be enlarged and the prices of other goods substituted,

so that by keeping these special monthly issues of "The Contractors' Supplement" contractors and other purchasers will have ready to hand an accurate compendium of prices for quick consultation.

We shall be glad to receive from readers suggestions as to any improvements and additions to this list of prices which would render it of still greater service to the architectural profession and the building trade.

This list is not intended to promote undercutting, and prices are subject to discounts for a quantity and for cash. Readers are advised to write for these. Where prices for goods are standardised and fluctuation takes place in trade discounts, our prices have the discounts deducted. In some cases it is difficult for firms to quote prices, and we have stated where they will be pleased to send catalogues and quotations immediately on application.

The Degenerates. A CONFERENCE of representatives of municipal, educational and labour interests convened by the Plumbers' Company and held last Wednesday at the Guildhall, to consider the question of the registration and training of plumbers and other skilled workmen, was an occasion which brought out some interesting speeches and pointed a moral which we think deserving of careful consideration. Mr. W. D. Caröe, Master of the Plumbers' Company, said that the three things which they had in view were the education, the examination and the registration of plumbers, and in all they had done they had had the hearty support of the men themselves. It had been borne in upon him, as an architect, that the only real system of training for craftsmen was that of apprenticeship. The work which the craftsmen of the past did, as was to be seen by an inspection of ancient buildings, could not be surpassed in the present day, and was seldom equalled. It was surprising to see, as he often had seen, work done thirty or forty years ago in restoring old buildings falling into decay, whereas the work of 600 years ago was perfectly sound. It was marvellous to observe

the way in which in the fifteenth and sixteenth centuries, particularly in Spain, the small technicalities of dealing with masonry were carried out without the slightest effort apparently, and yet always right. Architects nowadays had to give workmen a drawing for all those things. Dr. Macnamara, M.P., spoke more generally in regard to the way in which boys start life nowadays without any training, and end in joining the great army of unemployed when there is slackness of trade. In England and Wales they had 200,000 boys going out on mere errands every year. Under the age of twenty, there were 2,000,000 of them in the country, and between four and five millions under the age of thirty. Modern civilization has no room for the inefficient, and the unskilled workman has grown to be one of those sores that will have to be removed before we can expect to overcome the misery and want that exists owing to lack of employment. The skilled worker is a producer, and his labour is of value, and consequently he can be kept in full employment, because he is earning food for himself, but the unskilled workman has to be found employment. There is, however, another side to the question, which we have urged before, namely, that there should be some guarantee that the man protected by the trade unions (who insist upon a standard wage) shall be an efficient workman. They ought to see that their members are proficient. We can no more put up with the charlatan among the workers than we can among professional men, and if registration is necessary for the plumber, still more so is it necessary for the architect and the engineer. Every man who offers his services to the public should be capable. The public have a right to see that they are not deceived in this respect, and no doubt the time is soon coming when everyone will be forced to be a skilled workman. Our civilization cannot support the parasite.

Colour Effects.

THERE has been a good deal of talk at one time or another of colour in our streets, and the architectural profession has made many gallant attempts to remove the prevailing depression (as it has been called) in the appearance of our buildings by the use of strongly coloured materials, but so far as one can see the result has not been happy; in fact, the cry now is for less colour in our streets. The oppressive effect of strong gaudy colours toned down by dirty streaky soot marks is made worse when it occurs with an absorptive surface, like that of bricks or sand-faced terra-cotta, but strongly-coloured glazed materials are also somewhat too garish. The fact is, all colour combination in towns should be of a very low tone; indeed our atmosphere requires this always to be observed. Although in the open in bright sunshine strong colours are somewhat less garish, the ill-effect of too

great a use of colour in mass may be observed where we find a collection of modern-built houses in red brick with red-tiled roofs. A red house situated amidst trees looks very charming and gives just that necessary touch of colour to the landscape, but when a number of such houses are gathered together and the materials of which they are constructed do not afford opportunity for vegetable growths to tone them down, such as the hard-pressed bricks and vitreous "boiler plate" tiles, the note becomes too dominant—too blatant. The variegated tiles of Cambridge may be referred to as a thing to be desired in buildings instead of the uniform tiles in common use. If colour effects are aimed at, these should be, as stated above, of low tones, except perhaps in single instances. In a clear atmosphere, as in the open country, white is very pleasing, but it would hardly be in towns, although the white glazed ware is put forward as a solution of the problem, and certainly it seems to be fairly satisfactory. There is, too, another way of obtaining a satisfactory surface by the use of some stone which decays moderately, so as to always present a clean surface, such as Portland stone. In regard to bricks, the strong evenly coloured ones, like the hard-pressed terra-cotta bricks that do not tone down, should be used sparingly, and it seems unwise to employ them in association with red tiles, especially if the latter present such a shiny surface that they give no hold for verdure. Many of our bricks are not all good coloured; they are far too staring. The London stock, for instance, as now made, is too even, and of a bilious colour. Some stocks can be obtained which are soft and harmonious, and grizzles can be had which are uneven in colour, but our brick-makers do not seem to have learnt the lesson that too much manipulation of the clay and the desire for evenness can go too far. Luton bricks are coming into use because of their variegated colour. The Fletton brick, so largely used for cheap work, is much worse than the old stock because, although it is irregular in colour, it is striped like a zebra. Red stone looks very well in the locality where it is quarried, but the little pieces used in connection with red brickwork, and in districts where the surrounding tone is more of a bluish colour, as in Edinburgh, are altogether out of place. There is a possibility, however, of obtaining very fine effects by the use of light brown or yellow stones, which, in a clear atmosphere, weather to most beautiful soft tones. Marble, too, used in the rough unpolished state, gives some wonderfully fine colouring in some continental towns where the houses are built of the local material, and it is quite possible to use this in the form of rubble walling to a much greater extent. But however colour effects may be obtained, they will always be unsuccessful in this country unless they are quiet and restful.

MR. BAGGALLAY ON PORCHES AND APPROACHES.

THE following is a summary of the paper on "Porches and Approaches" read by Mr. Frank T. Baggallay, F.R.I.B.A., before the last meeting of the Architectural Association, our report of which was held over from last week on account of the great pressure on our space :—

Mr. Baggallay dealt with his subject historically. In this country, he said—at any rate from the time of the Druids until the last few years—there had never been any attempt to form those grandiose and impressive approaches which most other nations, ancient and modern, had deemed appropriate in the case of especially important or sacred edifices. We had no porches, which would compare, for instance, with those of some of the French cathedrals. But from the Tudor period down to the beginning of the last century the art of contriving decent and dignified approaches to private houses was well understood both in England and Scotland.

The Victorian Idea.

The ideas and circumstances of the nineteenth century led, however, to a deplorable change. Formal approaches almost disappeared with formal gardens in a vain and childish attempt to imitate the beauties of natural landscape. The stately gateway, the straight avenue, and the spacious forecourt gave way to a sort of glorified field-gate and a serpentine road which seemed to turn every few yards to avoid a laurel or a nettle, revealing, by carefully-arranged accidents, occasional glimpses of the surrounding scenery, and at last ending, sideways and unexpectedly, at the door of the mansion.

A Fine Processional Road.

From the point of view of this paper, however, it was specially worthy of note that the most striking sign of the better spirit now prevailing had been the scheming of a grand processional approach road to London's Royal palace. It was true that an untimely (and, considering the occasion, unlooked for) parsimony on the part of the public had shorn the work, for the present at any rate, of most of its architectural adornments, but the mere fact of its inception and execution was an encouragement to consider the question of architectural approaches generally.

Egyptian and Assyrian Examples.

First to consider were the great Egyptian temples as among the notable examples of the grand manner, their most striking feature—and one unique in the history of architecture—being the pair of great pylons which flanked and dwarfed the outer gate, and formed the front wall of the forecourt. When fully developed, the whole of the approaches to the Egyptian temple comprised an avenue of sphinxes, a pair of pylons, a forecourt, a hypostyle hall, then perhaps a second pair of pylons, a second court, and a deep portico or second hall of columns—constituting the most ambitious system of approaches ever carried out.

Proceeding, Mr. Baggallay dealt with the Royal palaces of Assyria, which, having been set on mounds, must have been reached by flights of steps, with inclines, probably, for the chariots. The main gateways seemed to have had semicircular arches faced with glazed tile or faïence, the responds of the arch being huge sculptured bulls with human heads. There were two very fine ones in the British Museum.

The approaches of the Mycenæan palaces differed entirely from all those hitherto noticed. They were more like the approaches to a Norman castle; indeed, the resemblance was striking if one forgot the drawbridge, and overlooked questions of style.

Grecian Examples.

Turning to Greece, the gateway on the Acropolis at Athens was undoubtedly merely a rebuilding, on a glorified and extended scale, of the gateway to the old palace of the kings of the Mycenæan period. The approach to the gates curiously enough remained the old narrow steep pathway winding round the bastion from the south. The genius of Greek art, however refined, seemed to have been narrow. A little superstition or priestly jealousy was allowed, even at Athens, to cripple or to crowd the finest works; and each had to stand alone, not one leading up to anything else, or itself the crown of a comprehensive scheme. It was true that in many, perhaps in most, cases there was a wall and portico enclosing the court or "temenos" in which the temple, or several temples with subordinate buildings, stood. But in all cases with which we were acquainted the form of the court, the position of the gate, and the situation and orientation of the various buildings seemed to have been entirely fortuitous, or decided in each case separately, without reference to the rest. In considering Greek approaches we could only admire the fine judgment and unwearied industry of the artists in refining the propor-

tions and the details of porticos such as those of the Parthenon and Theseum.

The Imperial Architects of Rome.

Of the ambitious spirit of the Imperial Roman architects in designing and carrying out the most splendid schemes of approach there was, on the other hand, ample evidence in history, and in the ruins of some of them.

The triumphal and memorial arches erected in Rome itself seemed to have been generally isolated monuments; but the arch of Trajan was the entrance to his forum, and the forum was the forecourt to the Ulpian basilica.

Another finely-conceived approach was that to Hadrian's mausoleum, now called the Castle of St. Angelo. It took the form of a bridge over the Tiber leading from the stone quay on the city side right up to the gate of the mausoleum.

Another great example was that at Baalbec, with its flight of more than fifty steps 150ft. high, and, as its most singular feature, the hexagon court. It was suggestive, too, to note the resemblance between this plan and those subsequent ones of such buildings as the Minerva Medica at Rome and San Vitale at Ravenna, though both of these were on a much smaller scale. Another curious feature at Baalbec, and one found in

GROUND PLAN.

FIRST FLOOR PLAN.

"THE BEACON," GRIMMS HILL, GREAT MISSENDEN, BUCKS.
J. BRUCE MERSON, ARCHITECT.

This house was built last year for Mr. Alfred Dunhill. The walls are of brick, rough-cast outside and whitened, and the roofs covered with Dunton Green tiles. All the windows are casements, painted white, and the frames painted green (also all outside wood and ironwork). A pleasing feature is a high bay window on the staircase divided by two transoms, and glazed with leaded lights. The architect was Mr. J. Bruce Merson, of 76, High Road, Kilburn, N.W., and the contractor Mr. George Parsons, of Prestwood, Great Missenden.

other more or less contemporary buildings in the east of the empire, though it did not reach Italy until later, was the breaking-up of the entablature into an arch over the middle intercolumniation of the portico, the space being made especially wide for the purpose.

Mr. Baggallay then went on to trace the porches and approaches of the Early Christian era, which was almost wholly occupied with the building and rebuilding of churches.

Early Italian Examples.

By reason of the changes that had taken place, churches assumed on the outside something of the forbidding aspect of a fortress, and, among other things, the entrance was guarded by a broad narthex, or porch, and a spacious forecourt surrounded by a high wall. All the earlier courts had either disappeared or been rebuilt, and Mr. Baggallay could only show the well-known one in front of the church of St. Ambrose, at Milan, which, though it used to be attributed to the ninth century, could hardly be earlier in its present form than the twelfth. But before the end of the twelfth century the spacious portico of the ancient world was disappearing in Italy. Having given to the architecture of that country such approaches as the porticos of the Pantheon, S. Vitale, S. Ambrogio, and last, but not least, St. Mark's, it had to give way, in deference to the almost universal poverty of the times, to the porch—a feature proportioned to the door and not to the building. It was Street in his "Brick and Marble Architecture in Italy" who had called attention to the fact that the porch was a feature confined to the north side of the Alps. Though that was not strictly true, the porch certainly had never flourished in Italy. There were plenty of those deeply-recessed doorways of which it was hard to say whether they should not properly be called porches, but the porch proper was rare, and, with two or three exceptions, was only found in the form of a shallow arched hood tied with an iron rod and resting on two columns, which columns often stood on the backs of lions or griffins. Mr. Baggallay thought this irrational idea of putting the columns of the porch on the backs of animals must (though some critics would not have it) have been borrowed from the East, where the fashion was ancient and persistent.

The most remarkable of Italian church porches was the gigantic one attached to the church of S. Antonio Piacenza, and called "Il Paradiso."

The Great French and English Portals.

But however restricted one might find the subject of porches when dealing with Italy, the same could not be said of mediæval England and France, where churches and cathedrals afforded an endless and varied series of examples. The magnificent series of the great cathedral porches allied to those at Chartres and Amiens could not be equalled or approached by any series of existing works of any age or country; while among English Gothic porches, none of course could touch the great western portico of Peterborough Cathedral—indeed, notwithstanding its comparative plainness and

simplicity, it was at least as much greater artistically as it was physically than the porches of Chartres. But, unfortunately, if we looked for other English Gothic porches that anyone could think of comparing with the French ones, we should be driven to rely on the Galilees of Ely and Lincoln. Of the rest of our cathedral porches the most worthy were the triple porch at Salisbury, the south transept porch at York, and the south porch at Gloucester.

Church Porches

next claimed Mr. Baggallay's attention, these including the grand three-storey south porch of Burford Church, Oxfordshire, the south porch of Beccles Church, Suffolk, the south porch of St. Nicholas, King's Lynn, the north porch of Thaxted Church, Essex, the south porch of Boxford Church, near Sudbury, the south porch of Southwold Church, the porch of the Temple Church in London (this forming a class by itself) and the familiar porch of St. Mary's, Oxford.

Porches and approaches to the great ecclesiastical and conventual establishments were next considered. Here, too, was great diversity, there being almost every conceivable form and degree of ornamentation between the grand, but forbidding, eighteenth-century

gatehouse on the hill at Ely and the light and gracious late structure at Worcester.

Mr. Baggallay went on to speak of old city gates, such as the Haarlem Gate at Amsterdam, and afterwards of the great gate-towers of the castellated mansions of England—at Oxburgh Hall, Hampton Court, Montacute, &c. But the best, and by far the richest, examples remaining were some of the great gatehouses to the courts of the Cambridge colleges—Trinity, Christ's and John's.

The gate-house itself was next dealt with by Mr. Baggallay, and the subsequent growth of gate-piers, the balls on which were said by some people to have been properly the gruesome emblem of a lord of a manor, since they represented the heads formerly exhibited at their gates.

Approaches by bridges and stairs were then last considered, a great number of Italian and English examples being considered.

Discussion.

A vote of thanks was proposed by Mr. Walter Millard and seconded by Mr. A. Needham Wilson, the latter, in speaking of the advantage which bridges gave to approaches, citing Mr. E. L. Lutyens' treatment at Sonning.

GROUND-FLOOR-PLAN.

FIRST-FLOOR-PLAN.

Scale of Feet.

HOUSE AT BYFLEET, NEAR WEYBRIDGE. CHARLES HEATHCOTE AND SONS, ARCHITECTS.

This house has recently been completed at a cost of about £1,500. It is one of a number to be erected on an estate at Byfleet, each house being allotted half an acre of land. The walls are of brick, rough-cast to the first floor, and the roofs covered with red tiles. The woodwork is painted white and the windows glazed with large squares. The accommodation is shown by the plans. Messrs. Charles Heathcote & Sons, of Savoy Court, Strand, are the architects.

Correspondence.

R.I.B.A. Fellowship.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—While agreeing generally with Mr. Musto's views as expressed in his letter published in your issue of February 21st, I think he is hardly correct in his first paragraph when he asks, with regard to the wholesale elections of Fellows, (1) "Is it a means of providing money for the exchequer? (2) keeping the Associates in check? or (3) a means of recognizing eminence in professional work?" The first question, I think, can answer itself, inasmuch as the Institute is not in any way hard up for funds. The second question—although a pertinent one—is answered by simply stating that any duly qualified Associate is eligible for a Fellowship. The third question (which should really be the first) is the most important one, and, in answer to that one, the true reason of the nomination and election of the group of "leading men" (I am glad Mr. Musto does not say "clever men") was not that the Institute (or the Council) wished "to honour men of power and eminence," but only to try to bolster up the present moribund Council in their absurd opposition to that which the majority of the members of the Institute wish for, namely, registration, inasmuch as nearly every one of these so-called "leading men," the new Fellows, is dead against the expressed wishes of all those earnest practitioners—hard-working and artistic men—who want our profession raised to a higher standard in public opinion, those who ask that the house agent, the auctioneer, the undertaker and the decorator shall be prohibited from calling themselves architects, or even Fellows of the R.I.B.A.

For more than twenty years past I have been working in favour of registration, and I am sure it must come to pass soon in spite of the ostrich-like attitude of the members of the present Council, the majority of whom stick their dull heads into the dead sands of past ages and refuse to see the active signs of the times, or to recognize that the Institute was not intended solely for their benefit, but, as stated in the charter, "for the general advancement of civil architecture." Up to now it seems to have been for the "general advancement" of the members of Council.—Yours truly,

HORACE T. BONNER, A.R.I.B.A.
CHEAPSIDE, E.C.

Plaster-of-Paris and Steel Preservation.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In your issue for February 7th, in the article on the preservation of iron and steel in connection with plaster coverings, while holding no brief for patent or other plasters, your comments upon the nature of plaster-of-Paris call for criticism in fairness to those whose interests are at stake. Though I have not found any free acid in the few samples of plaster-of-Paris which have come under my examination, it is possible that such free acid may occur in such plaster made artificially, though this does not seem likely and would be quite inexcusable. Natural gypsum, however, is a chemical compound, and its composition has long since been determined to be represented by the formula $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$. On raising its temperature to about 130 degs. C. it loses part of its water, and when this temperature is not exceeded a compound is produced which probably has the formula $\text{CaSO}_4 \frac{1}{2}\text{H}_2\text{O}$, which is called plaster-of-Paris, and is therefore not the same thing as gypsum. Your statement of its composition giving the percentage of its constituents is, omitting decimals, correct, but the whole of the forty-six parts of acid present are combined with the lime, and are in a perfectly fixed condition, and much less liable to obtain their freedom than the forty-

four parts of carbonic acid which constitute this percentage of ordinary chalk. When this plaster sets it absorbs about 13 per cent. of water chemically and forms crystals which have the same composition as the original gypsum; to this extent therefore the water mixed with it is at once removed as far as dampness is concerned.

Only two possible chemical reactions present themselves on contact with iron—one a reduction of the sulphate and oxidation of the iron, the other the replacement of the calcium by the iron; but owing to the high electro-positive character of calcium and the stability of the SO_4 radical neither of these reactions will take place.—Yours truly,

ALAN E. MUNBY, M.A.

LONDON, W.

[The remarks referred to were not our own. They were clearly stated as data collected by Mr. W. W. Kenly, Am.Soc.C.E., from the published experience of American engineers and contractors, and read at a discussion on the preservation of materials held by the American Society of Civil Engineers. The facts being given on the authority of Mr. Kenly, and in view of the possible discussion they might cause, we did not think it advisable to alter his original wording, although the author's chemical knowledge was obviously faulty. In view of the facts Mr. Kenly gave in respect to corrosion of iron and steel when in contact with plaster-of-Paris, and the widespread acceptance of this as the cause of many instances of corrosion that are common property in our building trades, we are surprised that Mr. Munby should deny the possibility of such deleterious action on the part of plaster-of-Paris. If further corroboration is needed we may refer to the letter below from Mr. Thomas Potter, whose long and varied experience of concrete work entitles him to rank as a foremost expert on the subject.—ED. B.J.]

Rust on Iron.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—A short time ago Mr. T. G. Jackson caused some alarm by suggesting that the extensive use of steel construction in London buildings was fraught with considerable danger, as it was mostly hid from view and it was impossible to say what chemical action was going on. It has often occurred to me that this danger existed to a serious extent in the iron construction of concrete floors before the introduction of Portland cement. The matrix was then sulphate of lime, better known as plaster-of-Paris, and is a material which attacks iron with a virulence similar, on a minor scale, to the dry-rot of timber. There are a large number of buildings in London and elsewhere having concrete floors in which plaster-of-Paris is the matrix, and the question is—are they safe?

I am sending you some pieces of iron which have literally tumbled off a large compound beam during some alterations, and to which the concrete is still adhering. This beam is of rolled iron and was fixed in place about forty years ago. As you will see, the rust has taken away a thickness of $\frac{3}{8}$ in. off the bottom flange—practically about one-half, probably more. Another curious feature is that the piece of an iron tie-rod sent with the other specimens is, to a less extent, corroded 2 ins. beyond where it came in contact with the plaster concrete. Is there any possible explanation of this? The specimens sent have not been selected as the worst. A practical builder informs me he has in his experience come across much worse examples. These specimens were in contact with the concrete on one side only. What must be the condition of iron joists embedded in similar concrete and entirely in contact with the latter? Plaster-of-Paris mixed with lime-mortar is still very much used to hasten setting for inside work, and is said under those conditions not to create rust;

but is this so, or is it that the effect is delayed until long after the building is completed and handed over by the builder?—Yours truly,

THOMAS POTTER.

66, VICTORIA STREET, S.W.

ARCHITECTURAL CERAMICS.

AT the Birmingham Builders' Exchange on Thursday last Mr. J. Miller Carr gave a lecture on "Architectural Ceramics." In Birmingham, he said, there were many important examples of the use of the ordinary colours of terra-cotta in buildings. The arcades with the malachite interiors, and several fine frontages in New Street, High Street and Union Street; Central Hall, with its noble tower; Queen's College and the Y.M.C.A. were cases in point, and if they were to add to these the older examples of the Law Courts, the General Hospital and some of the frontages in Newhall Street, they had a list that the city might well be proud of. He complained, however, that during the last five years, and especially during the last three years, Birmingham had not, in the matter of decorative architecture, acted up to its motto of "Forward."

New Uses of Terra-cotta.

Dealing with new uses to which terra-cotta might be put, Mr. Carr said that some years ago he was asked if he could not apply the methods of manufacture of slab mosaic to the purpose of putting a representation of Warwick Castle on to an old wall about 30ft. by 15ft. He at once replied that it could be done with striking effect, and in order to carry out the idea he put a tracing over a steel engraving of the castle, subdued all the worrying details, and expressed the subject by just a few broad fields of colour separated by broad outlines. The lecturer gave instances of other directions in which this principle might be applied.

By the use of simple means coupled with artistic designs it was possible to express in a permanent and architectural way on the exterior of a building the purpose of any kind of manufacture or business that might be carried on within. Had they not got nearly tired of the vulgar attempt to shout each other down on the part of shopkeepers by each striving to put larger letters across his front than his neighbour could? After all, the shopkeeper only proclaimed his name, but it would be much better if he could make his building itself declare his craft.

In conclusion Mr. Carr referred to the way in which the walls of many of the principal hospitals in the country had within the last few years been enriched and rendered almost vocal by illustrations of various nursery rhymes painted on the tiles.

COMPETITION REFORM SOCIETY.

Fourth Annual Report.

THE annual general meeting of the Competition Reform Society was held on Monday evening at 29, John Street, Bedford Row, W.C., when the report for the past year was presented. This was as follows:—

The most noticeable feature of the past year has been the diminution in the number of competitions which has come before the Committee for consideration, and the increase in the proportion of those which were disapproved. The relative numbers are shown in the following table:—

Year	No. of competitions considered.	No. disapproved.
Year 1904	70	11
" 1905	35	12

No efforts have been relaxed to obtain information, and the same sources have been made use of as heretofore; thus the conclusion to be drawn is that there was a considerable dearth of competitions in the year 1905.

The following is a list of the matters dealt with (those printed in italics having been disapproved and notices sent to members in the usual form):—

* Disapproval afterwards withdrawn.

Delay occurred in obtaining access to the conditions of the Caversham Schools, owing to a deposit of a guinea being required for them and to their not being otherwise immediately available, and the designs of several members were well advanced by the time they received notices of disapproval. In consequence of these unfortunate circumstances, and in view of the objections to the conditions not being of the most serious nature, it was resolved that if any member submitted his design the matter should be overlooked.

The competition for a school at Shepton Mallet was a limited one and not strictly within the scope of the Society, but it was considered advisable to send warning notices to all members practising in the vicinity.

A satisfactory reply was received from Rochester in answer to the representations made as to the defective clauses in the conditions, in consequence of which the Committee's disapproval was withdrawn.

The conditions for a school at Selby Oak were not considered sufficiently bad to disapprove, but notices were sent to members pointing out where they were unsatisfactory.

Some Suggestions.

The Committee has been greatly assisted by the useful information and suggestions which have been sent by members from time to time. In this connection the following may be specially referred to:—

Mr. Bellamy, of Yeovil, wrote that he considered action should be taken where deposits for conditions were not returnable unless *bona-fide* designs were submitted. He considered that competitors should have the option of returning conditions within a stated time should they decide not to compete, and that the deposits should then be returned to them.

Mr. Bateman, of Birmingham, wrote stating that the assessor for the competition for new municipal offices was about to be appointed and suggesting that a list of regulations for the conduct of competitions should be sent, &c.

Mr. C. Sharp wrote pointing out that the promoters of the Bexhill School competition were not holding a public exhibition of the designs. The Society's action in this case was rendered abortive by the designs being returned to their respective authors on the day that a letter of protest was addressed to the promoters.

Mr. Oatley, of Bristol, having been asked to assess the Swindon schools, wrote for the Society's opinion of the competition. Upon being informed that it had been disapproved, he declined to act.

Requests were received that enquiries should be made into what was considered a bad award in the competition for a free library at West Bromwich. The assessor was interviewed and his statements were regarded by the Committee as satisfactory.

Enquiries have been received constantly from members and non-members for information upon current competitions and other matters.

Although the widespread influence and knowledge of the Society is an accomplished fact, the membership remains small. Seven new names have been added to the list, but there have been a few resignations, so that the Society is practically where it was last year in this respect.

The funds of the Society are in a more satisfactory condition than they have ever been. This is due to the ready response made to the appeal for donations towards the reduction of the deficit, and to the reduced amount of the working expenses of the past year.

NOTES ON COMPETITIONS.

Proposed new Public Elementary School, Ossett.

"The Ossett Education Committee invite competitive plans and designs from architects for a new public elementary school to be erected in Southdale Road, Ossett." This is the heading of the conditions of competition which were received by applicants a few days ago. Having read the conditions there are some no doubt who will refer again to this announcement to ascertain if they were not mistaken in their impression that the word "architects" is used. They will find it there in good round type. Will architects enter for this competition? No; unless enquiry throws a more favourable light upon the ambiguous clause which refers to remuneration, for any person who does so can only be regarded as one who trades under a professional nomenclature without the requisite qualifications for so doing. This is the clause: "The Committee offer a premium of £50, and the architect whose plans are placed first shall be employed to carry out the work. The premium will merge in the commission of 4 per cent. on the amount of accepted contract, and shall include a complete set of quantities to the contractors. The architect will be precluded from accepting any trade discounts or commissions." The ambiguity lies in the statement as to quantities; no further reference is made to them in the conditions. Is the cost of their preparation to be included in the 4 per cent., or only the value of the lithographed copy supplied to the contractors? Is the word "contractors" meant to denote the firm whose tender is accepted for the work, or all contractors who apply for quantities? Inference tends to the view that the cost of quantities is to be included in the 4 per cent., for the meanness which would rob commission of a fifth of its value is also capable of still further parsimony. The same mean spirit is everywhere apparent. In the first place, the designs have to be delivered by the 14th of April. This allows only six weeks from the time of receiving the conditions in which to prepare plans for a school to accommodate 750. No date is given for the receipt of competitors' enquiries, nor is anything said about the matter. The cost allowed is absolutely inadequate. This is given at £9 10s. per child, and is to include furniture, gates, boundary walls, drainage, water and gas supply pipes and fittings, teachers' room, cloak-rooms, lavatories, waterclosets, heating and ventilation, painting, colouring, concreting of playgrounds, architect's fees, clerk of works' fees, and all matters of full completion. The architect is given no opportunity of economizing in

materials, for bricks are to be double-pressed; glazed bricks for latrines and the dados of classrooms and central halls are to be of the best quality; the sanitary arrangements are to be of the highest excellence, &c. Unless the cost of building is 20 per cent. lower in Ossett than it is in other parts of England, there will be trouble when the tenders are opened. The Committee intend to appoint a fully-qualified professional adviser to assist them in the selection of the architect to be employed to carry out the work. What is a professional adviser, and from what profession will he be drawn? What fee is it proposed to pay him? The Committee would do well to engage at once the services of a fully-qualified architect expert in school planning to advise them upon the revision of their conditions, if they would save themselves from disaster. The only satisfactory features in this competition are that no perspectives are required and that the conditions can be obtained without a deposit.

Hackney Library.

The drawings submitted in the competition for a new public library at Hackney will be on exhibition at the Hackney baths from Monday till Saturday next week, March 12th to 17th, inclusive, between 2 and 8.30 p.m.

Church at Southampton.

Mr. G. E. Smith, of Victoria Road, Southsea, has been awarded the first premium in a competition for a Wesleyan church to be built at Freemantle, Southampton.

Deptford Coroner's Court and Mortuary.

The Deptford Borough Council have accepted, in competition, the design of Mr. Horace T. Bonner, A.R.I.B.A., of 13 and 14, King Street, Cheapside, E.C., for their proposed coroner's court, mortuary and disinfecting station to be built at Watson Street, New Cross Road, S.E.

Southwark Public Library.

In the replies to intending competitors' questions it is stated that "the Committee have decided to be advised by a competent architect in the selection of designs." This is no guarantee that the lay opinion will not outweigh the professional view, and the decision of the Committee should be considered with the fact that it was always intended to include an architectural assistant on the assessing committee. No doubt this assistant is regarded as competent by the borough surveyor, who is also to be one of the assessing committee; it looks uncommonly as if this is the competent architect referred to. Intending competitors should make sure of the facts before concluding that the assessing difficulty has been overcome.

The Society of Architects' new Scholarship and Travelling Studentship.

The regulations and conditions for the new scholarship and the new travelling studentship of the Society of Architects have just been issued. Candidates for the scholarship must not be more than nineteen years of age at the date of the competitive examination, which will be for an essay on architectural history, and a freehand drawing, to be held in London on May 10th next, entries for which must be made before May 1st on a form to be obtained from the secretary of the Society of Architects at Staple Inn Buildings, Holborn, W.C. No entrance fee is required. The scholarship is of the value of £10, and is tenable for three years, subject to the council being satisfied from year to year with the progress made by the holder.

Candidates for the travelling studentship must be on the Register of Students, the maximum age limit being twenty-eight. The competition drawings, upon which the studentship will be determined, must be delivered at the Society's offices not later than May 1st next. The studentship is of the value of £25, and carries with it the silver medal of the Society. It will be awarded annually, the holder being required

to undertake between June 1st and October 1st a sketching tour of not less than three weeks' duration. The studentship may only be held once by the same person. The subject set for this year is a small country house of such accommodation as can be comprised in 60,000 cubic feet, at 1s. per foot (£3,000) measured from the bottom of the footings to half-way up the roofs, excluding dormers and chimneys. A complete set of working drawings to $\frac{1}{4}$ in. scale is required, with $\frac{1}{2}$ in. details of hall and staircase, and portion of front elevation.

The following is a list of competitions open:—

DATE OF DELIVERY.	COMPETITION.
Mar. 12	SCHOOL AT GREENOCK.—Premiums of £42 and £31 10s. for designs placed second and third. Particulars from Mr. A. F. Niven, Municipal Buildings, Greenock.
" 17	LIBRARY AT PEEL (I.M.).—To cost £500. Single premium of £10. Limited to architects in the Isle of Man. Particulars from Mr. George Cannell, Town Clerk, Douglas.
" 20	FREE LIBRARY AT BANGOR.—Premiums of £25 and £15. £1 1s. deposit for conditions. Particulars from Mr. W. H. Worral, Municipal Offices, Bangor, North Wales.
" 24	FREE LIBRARY AT SWADLINCOTE (limited to architects practising within 30 miles of Swadlincote).—Premiums of £25, £15 and £10. Particulars from Mr. W. A. Musson, Clerk, Council Offices, Swadlincote.
" 31	BIRMINGHAM COUNCIL HOUSE EXTENSION (Sketch Plans).—£1 1s. deposit for conditions. Particulars from Birmingham Town Clerk, Council House.
" 31	DWELLINGS AT MILAN EXHIBITION.—Premiums £240 and £80. Particulars from the Exhibition Committee, Milan, Italy.
April 2	PUBLIC LIBRARY AT SOUTHWARK (to cost £7,000).—Premiums of £50, £30 and £20. £1 1s. deposit for conditions. Particulars from Mr. J. A. Johnson, Town Clerk, Town Hall, Walworth Road, S.E.
" 14	SCHOOL AT OSSETT.—Premium of £50 (to merge). Particulars from the Secretary at the Education Office, Ossett.
" 15	PEACE PALACE AT THE HAGUE.—Particulars from the office of the Carnegie Foundation, Noordeinde 33, The Hague.
May 31	NATIONAL CONGRESS HALL FOR BRAZIL.—Premiums of 15,000, 10,000 and 5,000 milreis (equivalent to about £1,685, £1,125 and £562 respectively). 5,000 milreis also for designs not pre-empted but desirable to be acquired. The conditions of the competition can be seen at the offices of the Commercial Intelligence Branch of the Board of Trade at 73, Basinghall Street, E.C.
No date	ISOLATION HOSPITAL AT STONE.—Limited to architects in the district. Particulars from Mr. J. J. Chapman, clerk to the Stone Joint Hospital Board, Stone, Staffs.

PAYMENT OF DISTRICT SURVEYORS BY SALARIES.

THE adjourned report of the Building Act Committee on this subject was discussed at last week's meeting of the London County Council. Captain Hemphill (chairman of the committee) said that the proposed new scheme for the payment of district surveyors by salaries instead of by fees would tend to improve the service and would effect considerable economy, it being estimated that the saving would amount to about £10,000 a year. Mr. Smith objected to the proposal on the ground that no defects had been discovered in the present system. Mr. Phillimore said that if they were to obtain really satisfactory work they must do away with the system at present in vogue under which men gave only a part of their time to the work. Mr. Howell J. Williams declared that the adoption of the proposal would lead to the formation of a new department of the Council, which would entail the appointment of many highly-paid officers and would in the end lead to enormous increased expenditure. Sir R. M. Beachcroft could see no possible reason for the proposed

change. He did not believe that when the district surveyors became the collectors of fees for the Council they would collect anything like the sum of £52,000 a year, which had been the amount of the fees collected for several years past. Lord Welby said that the Finance Committee did not look with very great favour on the scheme now before the Council, fearing that its adoption might involve a charge on the rates. He moved that the recommendation be referred back to the committee. Mr. Radford, M.P., seconded the amendment, believing that the scheme would involve the Council in a large financial loss. After further discussion the amendment was, upon a division, carried by 59 votes to 44. The recommendation was therefore referred back to the committee.

OLD ARCHITECTURAL ASSOCIATION DAY STUDENTS' CLUB.

A SPECIAL general meeting of the members of this club (the late A.A. Old Day Students' Club) was held on Thursday, February 22nd, at the Florence Restaurant (Mr. A. N. Peckham in the chair), to consider what steps should be taken in reference to the recent action of the council of the Architectural Association in passing resolutions:—

- (1) That the words "Architectural Association" or any abbreviation thereof shall not be used by the Old Day Students' Club in any way.
- (2) That no reference to the Club shall be made in any official publications of the Association in future.
- (3) That no meetings in connection with the Day School Students' Club shall be held on the Architectural Association premises.

Twenty-nine members were present. The hon. secretary (Mr. Wilfred I. Travers) read the correspondence which had passed between the committee of the Club and the council of the Architectural Association, and outlined the policy which the committee proposed to adopt in the future by encouraging students to join the Club on leaving in preference to seeking recruits among the newer students, and by extending the privilege of membership to those past students of the school who quitted the profession of architecture; thus retaining the true position of the Club as an old boys' club.

Resolutions were passed:—

- (1) That the name of the Club be changed to the "Old Architectural Association Day Students' Club

(in proposing which the hon. secretary pointed out that it would make quite clear the difference in the position of this Club and the newly-formed A.A. Musical and Athletic Clubs in regard to the Architectural Association).

- (2) That rule 5 be rescinded, and that the hon. secretary be instructed to communicate with those gentlemen who have ceased to be members under this rule, with a view, should they desire it, of re-instatement.

- (3) That in rules 15 and 16 the word "eight" be altered to "nine" so that there shall now be nine members of the committee in addition to the hon. secretary and the treasurer.

(It was pointed out that the opportunity had been taken to clear up a mistake made in an amendment of this rule at the last annual general meeting, and that this motion had nothing to do with the real cause of the meeting.)

- (4) That the committee be instructed to make all necessary verbal alterations in order to carry out these resolutions.

- (5) That the council of the Architectural Association be notified by letter of the proceedings of this meeting, and that the committee of the Club be now instructed to write such letter and to forward it to the council for their meeting on Friday, March 9th.

ROYAL ACADEMY EXHIBITION, 1906.

THE sending-in day for architectural works is Friday, March 30th, from 7 a.m. to 10 p.m. as hitherto. Will architects let us have their drawings as early as possible. We shall be glad to deliver them free of charge after making reproductions of such as we desire.

MR. GOSCOMBE JOHN ON SCULPTURE.

IN the first of his lectures on modern sculpture at the Royal Academy last week Mr. W. Goscombe John, A.R.A., said that Bacon was the first great English sculptor. Flaxman's fame would probably rest more on his outlines than on anything else, and the work of another man of the period, Banks's "Falling Titan," was curiously like that of Rodin.

The Great French School.

There had been three great periods of sculpture in the world—the Greek, the Renaissance and the French. It was Rude who headed the third period, and in its own way nothing surpassed his relief of the "Mar-seillaise." Carpeaux, the gifted pupil of Rude, was the first of the distinguished band of modern sculptors who had shed lustre on France, among them being Barye, Falguière, Frémiet, Mercié and Rodin. Since the Assyrian sculptures there had been no animals to compare with those of Barye. Falguière, essentially a modern, had a facility and a rapidity of vision unequalled among his contemporaries. His influence was great in the schools, and it was his teaching more than any other that had produced the wonderful modelling now common among the younger French sculptors. There was Dalou, too, whose work never suggested the model and was full of a sense of the open air. Rodin was a fighter against much that was conventional in sculpture. It was a matter for regret that his work had been the subject of so many polemics, for, whereas one side declared his sculpture to be finer than ancient art, his opponents described him as a trickster. "But remember," said Mr. John, "Rodin is a great artistic personality of whom we should all be proud. The author of the 'St. Jean' needs no eulogy; he has written his name in the annals of sculpture."

In Italy the glory of the sculptor seemed to have departed, although as carvers the Italians had no equals; while in Germany no great sculptor had appeared since Rauch. Russia, however, had two men of note in Antokolsky and Prince Troubetskoi. Few men to-day were producing more suggestive and delightful work than St. Gaudens, America's most distinguished sculptor.

Among English sculptors Mr. John referred, of course, to no living men, but he paid a tribute to the memory of Onslow Ford and Bates and Armstead, and spoke of Stevens as "a truly great artist—a splendid anachronism."

Sir William Richmond's Lecture.

On Thursday Sir William Richmond delivered the first of his Academy lectures on "The Evolution of Sculpture—Egypt and Greece." The Sphinx, he said, was the oldest piece of sculpture known, and, in his opinion, one of the noblest achievements of art. Phidias himself could hardly have excelled it. The tendency of Egyptian art was essentially realistic. How it acquired this tendency we did not know, but there must have been a long immature period. It had been asserted that the Egyptian statues in hard marble had been carved with flint tools, and it was possible that was so. There was an Egyptian head of an officer in the British Museum which was a lesson in sculpture. It was almost Holbeinesque, and one of the greatest efforts of portraiture in the world. As an illustration of the excellence of old Egyptian work the lecturer told a story of the opening of one of the tombs in which in the sand on the floor were still to be seen the footmarks of those who carried in the body. So exactly had the stones been fitted that not a particle of sand had drifted in during all those years to disturb the traces. It was before the days of trade unionism, said Sir William sarcastically.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Masonwork.

COATBRIDGE.—J. H. writes: "Where can I get information about ramp-twist mason-work?"

From "Stairbuilding and Handrailing," by William & Alexander Mowat, price 12s. 6d. post free from our offices.

Books.

SOUTH WALES.—CONSTANT READER writes: "I am working for the P.A.S.I. examination, and would like to know of reliable but not costly works on the following subjects:—(1) Quantities; (2) house drainage and plumbers' work; (3) mensuration; (4) dilapidations, and (5) surveying and levelling."

(1) Davis's "Quantities and Quantity Taking," price 3s. 6d.; (2) "Sanitary Fittings and Plumbing," by G. L. Sutcliffe, price 5s., and Coleman's "Sanitary House Drainage," price 6s.; (3) Millis's "Technical Arithmetic and Geometry," price 3s. 6d.; (4) Fletcher's "Dilapidations," price 6s. 6d.; (5) Walmisley's "Land Surveying and Levelling," price 6s. nett. These books will be sent post free from our offices for the prices named.

LONG EATON.—E. writes: "Please enumerate the two best books on architectural perspective and land surveying, levelling, &c., respectively."

Middleton's "Perspective," price 2s. 6d., and Walmisley's "Land Surveying and Levelling," price 6s. nett.

SKIPTON.—ALPHA writes: "Which is the best book on valuations for mortgage and probate?"

Fletcher's "Valuations and Compensations," price 6s. 6d.

COVENTRY.—INSPECTOR writes: "What are the best books on steel construction building and reinforced concrete work?"

Freitog's "Architectural Engineering," price 15s.; Adams's "Practical Designing of Structural Ironwork," price 8s. 6d.; and Marsh's "Reinforced Concrete," 31s. 6d.

NOTTINGHAM.—G. W. C. writes: "Which is the best book on the construction and arrangement of chapels for Methodists?"

Perhaps some reader can provide the information.

TUNBRIDGE WELLS.—T. B. B. writes: "Which is the best text-book to study for the syllabus of the Board of Education's examinations in elementary practical mathematics?"

Millis's "Technical Arithmetic and Geometry," price 3s. 6d. post free from our offices.

Buildings to Measure around Stockport; Cheadle Church.

STOCKPORT.—A. E. M. W. writes: "(1) Kindly inform me of any buildings around Stockport suitable for the two sets of measured drawings for the R.I.B.A. intermediate examination. (2) What style is Cheadle Church, and would the porch be sufficient to measure and draw?"

(1) Thirteenth-century work will be found at Prestbury. Baguley Hall, Combermere Abbey, the churches at Warburton, Symm, Norton and the churches of SS. Mary and

Nicholas at Nantwich contain examples of fourteenth-century work. Fifteenth-century work will be found in the churches of Bowden, Northenden and Gawsorth. This neighbourhood abounds in fine mansions such as Bramhall, Marple Hall, Baguley Hall, Holford Hall, Moreton Hall, Harden Hall and Adlington. There are also many old timber and plaster inns in this district, such as the "Swan and Lion" at Congleton and the inn at Brereton. (2) The style of Cheadle Church can best be judged from an examination of the mouldings and other features. The Pugin students who have passed through Cheadle have not thought it worth while to mention its church, so you would probably do better to devote your attention to one of the buildings mentioned above.

H. Y. M.

Overhanging Wall.

LONDON.—E. S. writes: "I now give further particulars in regard to my enquiry on p. 91 of your issue for February 14th. There are no T marks on the plan, but the wall in the garden has piers or counterforts on my side, and also on my neighbour's. The wall divides the two main buildings, not the back additions. If you think I am a part owner, please say to whom I should write to enforce my neighbour doing his part."

The fact that there are piers on both sides of your garden boundary wall—in the absence of better evidence—would prove that the wall is of a "party" character, and should therefore be maintained at the joint expense of the lessees on either side. This presumption as to ownership and liability to repair can of course be rebutted if it can be proved that one owner only has repaired the wall on a former occasion. If you do not wish to deal personally with your neighbour, cannot you appeal to your landlord? (I gather both your house and that adjoining are leasehold and under the same freeholder.) His agent would probably be the right person to enforce a repair of this kind.

F. S. I.

Acetylene Gas for Country-house Lighting.

HARROGATE.—X. Y. Z. writes: "In fitting up a country house with a moderate-sized installation of acetylene gas, which of the many systems advertized by various firms do you recommend? What are the advantages of the particular system advocated and the name of the firm who could fit it up? Should composition lead pipes be used? Can you refer me to the date of any article recently in your journal dealing with the subject?"

It would be invidious for us to make any distinction between the many excellent acetylene generators on the market. You must investigate them for yourself, and choose the simplest for cleaning. Most apparatus are now safe. Iron pipes should be used. For information on acetylene lighting see "Specification No. 8," price 3s. 3d. post free from our offices. A recent enquiry in our columns will be found answered on p. 66 of the issue for January 31st.

Strawberry-coloured Bricks.

B. writes: "Who is the maker of strawberry-coloured bricks as supplied in the Hampstead district?"

This is altogether too vague a question to be answered. Has our correspondent seen red bricks for the first time? or does he think strawberries are only of one colour and one tint?

L.C.C. District Surveyors.

COVENTRY.—INSPECTOR writes: "It is my intention to sit at the examination for building surveyors held by the R.I.B.A., but I have been unable to obtain copies of past examination papers; consequently I am in some doubt as to the extent of preparation necessary. Could you enlighten me and advise me as to the best books to study? For your guidance

I must say that I have been a building inspector for this and another corporation for 5½ years, and I have certificates in the honours grade of masonry, brickwork, carpentry and building construction, also the certificate of the Royal Sanitary Institute."

Write to the secretary of the Royal Institute of British Architects, 9, Conduit Street, London W.

Drawings of Vaulting.

MANCHESTER.—MIDLAND writes: "Have you ever published drawings of any of the vaulting in either Salisbury Cathedral, Bath Abbey or Manchester Cathedral? If not, do you know any book containing illustrations of same?"

No, we have not published such illustrations. Perhaps some reader can provide the information.

R.I.B.A.

New Fellows and Associates.

A SPECIAL general meeting of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., to formally elect Sir Lawrence Alma-Tadema, R.A., F.S.A., Hon. F.R.I.B.A., as the recipient of the Royal Gold Medal this year.

A business meeting was afterwards held, when the following were elected:—

[Of London where not otherwise stated]

As Fellows:

Matthew Garbutt, E. W. Marshall, G. Ransome (Cape Town), H. A. Satchell, Harry Sirr and Arthur Sykes.

As Associates:

A. W. Addison (Cambridge), A. D. Aitken (Airdrie, N.B.), J. H. de C. Ballardie, J. Boyle (Bolton and St. Anne-on-Sea), J. E. Braithwaite (Leeds), S. Bridges, A. E. Bullock, M. Bunney, John Cocker, T. T. Cumming (Reading), E. J. Dixon, B. Drummond, F. Dyer (Manchester), T. S. Fraser (Cardross, N.B.), W. Curtis Green, E. L. Hampshire, G. Hanson (Halifax and Bradford), C. H. Holden, A. Hunter (Colwyn Bay), A. H. Lamont (Edinburgh), L. W. C. Lorden (Hythe), W. K. McDermott, W. P. Marr (Kingsbridge), D. Mitchell, H. A. Moon, G. Morland (Croydon), H. S. Morran (Auckland, N.Z.), A. R. Myers (Edinburgh), A. C. Notley, D. M. O'Connor, A. J. Peyto, S. C. Ramsey, W. H. Riley (Leicester), H. Ryle, D. A. Shaw, J. H. Shearer (Exeter), P. M. Stratton, J. R. Sykes, P. Turner (Bradford), M. O. Type (Birmingham) R. F. Wheatly (Bromley), E. C. M. Willmott, L. S. Wood, H. E. Woodsend (Nottingham).

BUILDING IN NEW YORK.

THE following figures show the extent of building work in the city of New York for the past thirty-five years:—

	No. plans filed.	Estimated cost of structures.
1870	2,351	£6,933,799
1875	1,406	3,645,374
1880	2,252	5,823,067
1885	3,370	9,183,648
1886	4,097	11,675,930
1887	4,385	13,367,996
1888	3,076	9,428,495
1889	2,621	13,758,406
1890	3,507	14,935,274
1891	2,821	11,214,524
1892	2,967	11,821,523
1893	2,272	11,032,590
1894	2,592	10,284,115
1895	3,838	16,822,206
1896	3,149	14,377,951
1897	3,516	16,733,768
1898	3,626	14,558,802
1899	4,894	25,442,251
1900	1,969	11,446,671
1901	2,512	23,779,564
1902	1,703	17,268,880
1903	1,757	16,283,882
1904	3,040	19,349,968
1905	4,805	32,560,353

OF THE
UNIVERSITY OF ILLINOIS

EUSTON SECONDARY SCHOOL AND TECHNICAL INSTITUTION.

IN this school (the design for which, by Messrs. Spalding & Spalding, F.R.I.B.A., at 15, Queen Street, Cheapside, E.C., has just been accepted in competition) accommodation is provided for 150 girls and 150 boys. It was desired that the two entrances should be from Park Square, and this has been arranged. The plan adopted is that of the "central hall" type. The twelve classrooms are ranged around the assembly hall on two floors, and are approached direct therefrom. This assembly hall is 64ft. long by 37ft. 6ins. wide, and will accommodate 300 students. The classrooms are all lighted from the left, and all have either a north or south aspect. On the first floor two art-rooms are provided, both having a north light. Chemical and physical laboratories are also provided on this floor, as well as a cookery classroom approached from the girls' staircase. Accommodation is provided for the headmaster, masters and mistresses, also an office for the administrative work of the school. These rooms are centrally placed so as to ensure the easy supervision of the whole building. Two workshops are provided as a detached building in the playground, one for ironwork and the other for woodwork. The cloakrooms and changing rooms are well cut off from the main building, though easily accessible, and are well lighted and cross-ventilated in each case. Bicycle rooms are placed near both the boys' and the girls' entrances, also covered playsheds in the playgrounds. The building will be heated on the low-pressure hot-water system and adequately ventilated by means of extract flues connected with the flèche on the roof. Externally the walls will be faced with local bricks and stone dressings, and the roof covered with slates. The cost of the building will be about £7,000.

WHO WAS THE ARCHITECT OF THE HOUSES OF PARLIAMENT?

THE "Burlington Magazine" for March contains an article by Mr. Robert Dell with the above title, which will startle those who do not remember the controversy in 1867-8 as to the assistance given by Augustus Welby Pugin to Sir Charles Barry in the designing of the Houses of Parliament. Mr. Dell recently had all Pugin's papers placed at his disposal, and was struck by the extraordinary resemblance to the Houses of Parliament in some original designs drawn by Pugin in 1832-4 (*i.e.*, before the old Houses of Parliament were burned down) and by certain entries in Pugin's diaries.

"The hint given by the drawings led me," says Mr. Dell, "to make a careful enquiry into the matter. The conclusion at which I arrived was that Pugin gave such help to Sir Charles Barry, the ostensible architect of the Houses of Parliament, as to entitle him to be considered the joint-architect. Indeed, it seems to me that whatever artistic merit the building possesses is mainly due to Pugin. The plan and general construction were undoubtedly Sir Charles Barry's, though even in the general design he must have owed much to the early drawings of Pugin already mentioned; but I believe that Pugin not only drew the elevations which were sent in to the competition by Mr. Barry, as he then was, but was in fact their actual designer; that when, after Mr. Barry's appointment as architect, considerable alterations were made, Pugin made the designs for nearly every detailed part of the building; and that practically all the details of the building as it now stands—everything, that is, beyond the shell—are really Pugin's. In fact, the case, in my opinion, is that of the familiar ghost who still walks, one regrets to say, in architectural circles."

Notes and News.

For not providing a Dampcourse in three houses a Bridgend builder named James was recently fined £5 on each house, and costs.

The Annual Dinner of the Nottingham Architectural Society was held on February 23rd, Mr. A. W. Brewill, president, in the chair.

A new Edinburgh Building.—It is proposed to demolish the Douglas Hotel, Edinburgh, and to erect at the corner of Princes Street and South St. Andrew Street extensive premises for Messrs. Forsyth, outfitters.

The Otis Elevator Co., Ltd., have secured the contract for six electric passenger elevators on the City and South London Railway Co.'s extension to Euston, namely, four elevators at the King's Cross and St. Pancras Station and two at Euston Station.

Inspecting a Lightning Conductor.—Two steeplejacks have made an inspection of the lightning conductor on the church of St. Martin's-in-the-Fields, a precaution which has been taken every ten years since the building was struck and practically destroyed in 1842.

The Resistance of Bends.—In his recent presidential address to the Institute of Sanitary Engineers Prof. E. G. Coker, M.A., D.Sc., F.R.S.E., dealt with the measurement and flow of water, more especially in pipes. Referring to bends, he said that the bend of least resistance was one having a mean radius of about $2\frac{1}{2}$ times the diameter of the pipe, and that the resistance of the bend was about $3\frac{1}{2}$ times that of a straight pipe of the same length.

The Change in Mechanics' Institutes.—Speaking at the recent meeting of the Newcastle and District Clerks of Works' and Builders' Foremen's Association, Mr. J. Wightman Douglas, architect, said that for many years mechanics' institutes were the means of spreading technical information among the artisan classes of this country, and it was to be regretted that many of those institutions had become merely centres of amusement and recreation. It now devolved upon technical colleges and societies like theirs to carry on the task of improving skilled labour. It was necessary to persuade the workman to take an active and intelligent interest in his work.

Patent Victoria Stone.—At the recent eighteenth ordinary general meeting of the shareholders of the Patent Victoria Stone Co., Ltd., held in London, the chairman (Mr. J. J. Griffiths, J.P.) said that during the past year they had not had such large contracts for flagging, but in the aggregate the orders were approximately the same as in the previous years. There had been an increased demand for patent Victoria stone for architectural purposes, and the continuance of this demand tended very much to strengthen the position of the company. The stone had now been on the market for upwards of thirty-six years, and the original process of silication had been rigidly adhered to. Dr. J. W. L. Glaisher, F.R.S., in proposing the re-election of Mr. Griffiths as a director of the company, said this was originally Mr. Griffiths's own business, and he was the first to introduce the use of siftings of the kind they now used. When Mr. Griffiths formed the concern into a company, in 1888, he certainly did not over-capitalize it. For eighteen years the company had never paid less than 10 per cent., and in the successful years, when trade was at its best, they were able to pay a bonus of $2\frac{1}{2}$ per cent. besides accumulating a reserve fund of £20,000, while the stock which they saw in the balance-sheet was valued at £64,000, so that the state of the company, after eighteen years' trading, was exceedingly prosperous.

"Reason as a Basis of Art."—A book with this title, by Mr. C. F. A. Voysey, is announced by Elkin Matthews, of Vigo Street, W., price 1s. nett.

The new Roof of Charing Cross Station will be glazed by Messrs. Mellows & Co., Ltd., on their patent "Eclipse" system. It is hoped that the temporary repairs to the roof will be sufficiently advanced to allow traffic to be resumed on March 19th.

Fall of Vaulting at Winchester Cathedral.—A portion of the spandrel of the vaulting to the north-east of the retro-choir of Winchester Cathedral, closely adjoining Bishop Waynflete's chantry, fell recently. Other portions of the adjacent vaulting are in danger, but they are being watched.

An Industrial Exhibition at Southend-on-Sea is to be held in the Kursaal from May 12th to 30th next. The sections include one for building requisites, surveying, sanitary engineering, heating, lighting and ventilation. Full particulars can be obtained from the secretary of the exhibition, Mr. P. T. J. Bacon, at the Kursaal, Southend-on-Sea.

The Provident Institution of Builders' Foremen and Clerks of Works.—At the recent annual dinner of this Institution, held at the Holborn Restaurant, Mr. John Beer, corresponding secretary, said that when he assumed office the Institution was able to pay its pensioners 12s. 6d. a week; since then the amount had been raised to 15s., and he hoped ere long it would be £1, with 10s. for poor widows. In connection with the dinner subscriptions were announced to the amount of £502 7s. 6d.—the highest total yet obtained at any annual dinner of the Institution.

Ulster Society of Architects.—A general meeting of this Society was held at Belfast on February 23rd, Mr. J. J. McDonnell, J.P., president, in the chair. Mr. W. J. Gilliland, F.R.I.B.A., reported on the progress made by those having charge of the Enrolment of Architects' Bill, and gave a *résumé* of the evidence given by him before the Institute sub-committee. Correspondence was read relative to the by-law proposed to be made by the Belfast and District Water Commissioners fixing the capacity of cisterns; also as to the employment of an engineer for architectural work in connection with asylum buildings. The president made reference to the R.I.B.A. Council's action upon the Easement of Light Bill, which it was hoped would be dealt with in the present session of Parliament.

Salonica was the subject of a lecture by Prof. Charles Gourlay, B.Sc., A.R.I.B.A., before a recent meeting of the Glasgow Technical College Architectural Craftsmen's Society. After referring to its history, Professor Gourlay dealt with its ancient walls, white tower and sculptured Roman arch. Then in considerable detail he described the Early Christian and Byzantine churches, now mosques, which still remain in a remarkably well preserved state in this modern Turkish town—the church of St. George, with its circular nave and beautiful mosaic decoration on the interior of its dome, which is the greatest and best work in Byzantine mosaic now in existence: the mosque of Eski Djouma, formerly a three-aisled basilican church; the church of St. Demetrius, one of the best preserved and most finely proportioned of five-aisled basilicas of the Early Christian period; the church of Sta. Sophia, with its interesting plan and dome at the crossing, which is decorated internally with a very beautiful mosaic; and lastly, the later examples, St. Elias with its triapsal plan, St. Bardias having the typical Greek cross plan, the Holy Apostles with its one central and four smaller domes (showing in its pristine form what ultimately became a universal feature of the Russian churches), and St. Pantelemon, a small but interesting church now restored.

The cost of rebuilding Blackfriars Bridge, Parliamentary sanction for which is now being sought, is estimated at between £200,000 and £250,000.

The Second International Congress on School Hygiene will be held in London from August 5th to 10th next year. The offices of the Congress are at the Royal Sanitary Institute, Margaret Street, W.

The new Carlton Hotel, Johannesburg.—The locks for this hotel (some particulars of which appeared in our issue for last week) were made and supplied by Messrs. Colledge & Bridgen, of Midland Lock Works, Wolverhampton.

Builders' Current Price List of Specialities.—In this feature, which we published for the first time last week, a printer's error occurred in respect to "Kulm" fire-resisting partition slabs. No price should have been stated; this error will have been obvious to readers who know how economical "Kulm" partition slabs are, while at the same time official tests have proved their remarkably high fire-resistance.

Concrete.—In view of the interest now taken in all matters appertaining to concrete and cement, a new illustrated magazine called "Concrete and Constructional Engineering" is to be published once every two months from 57, Moorgate Street, London, E.C., price 1s. nett. The first number has just made its appearance. It gathers from the British and foreign press a good deal of useful information and contains a few original articles.

A Subterranean Passage has been discovered in the course of the demolition of some old houses in Craig's Court, Whitehall. It is nearly 30ft. long, and runs north to south to within a short distance of the Army Pay Office. (Tradition says that a subterranean passage existed from No. 2, Craig's Court to the Royal Palaces at Whitehall, and Nell Gwynne resided at one time at 2, Craig's Court.) An interesting carved water tank 200 years old was also discovered.

A Building School.—A day preparatory trade school for boys intending to enter the building trade has been opened at Leeds. It is situated at Woodhouse. Mr. James Neill, F.S.I., will supervise the classes. He is also the head of the building department at the Leeds Institute, where there are 780 building students. The Woodhouse Trade School will be open five days a week, from 9 to 12 in the morning and 2 to 4.30 in the afternoon. Two or three leading builders have already expressed their willingness to accept apprentices from the school.

New Address.—Messrs. Johnson, Clapham & Morris, of Manchester, manufacturers of steel concrete wire lattice, have opened London offices at Queen Anne's Chambers, Tothill Street, Westminster, S.W. Johnson's wire lattice, it will be remembered, was used to great advantage in the Savoy Hotel extensions. It has the merit of very great strength, and is made of almost any length, so that it can be continued over many floor-spans, thus rendering the whole reinforced-concrete construction monolithic, and giving additional strength and safety, with great economy in the amount of metal.

A new Free Library at Fenton, Staffs., is to be opened to-day. The total cost of building, furniture and fixtures (about £5,300) has been defrayed by Mr. Andrew Carnegie. The building is of Accrington red bricks and white Hollington stone, the roof being covered with local blue brindled tiles. Floors are fireproof and are laid with ceramic mosaic in the hall, landing, &c., and the floors of all public rooms laid with pitch-pine blocks. Walls are plastered with "Adamant" with a tile dado 5ft. high around the general reading-room, hall, staircase and lavatories. The architect was Mr. F. R. Lawson, of Fenton, and the general contractor Mr. John Bagnall, also of Fenton.

A new Central Mortuary at Birmingham is to be built on a piece of land adjoining the Estates Department, off Newton Street, and abutting on the back of the chief fire-station. The new building, which is to cost £2,723, will provide accommodation for thirteen bodies. Provision will be made for post-mortem examinations, &c.

Furniture Details.—A book of interest to all who make, design or sell furniture has just been published by Mr. A. H. Botwright, of 14, City Road, London, E.C., price 3s. 6d. nett. It is entitled "Useful Details," and comprises authentic details in all the principal furniture styles. It has been compiled by the editor of the "Furniture Record."

Mr. Bryce's Conjecture.—In the course of his lecture on "History in its relation to Architecture," delivered at Carpenters' Hall last Thursday, the Right Hon. James Bryce, M.P., alluded incidentally to India. He said that it was a melancholy reflection that the English were not leaving in India much that was of architectural importance. If by some catastrophe we were to quit India and leave her to her own devices for 500 years, what traces, he wondered, would remain of English occupation. He thought the embankments, the railways, the cuttings and the tunnels would be the chief remains.

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:—

Buildings between Nos. 65 and 69, South Side, Clapham Common, Clapham, on the application of Horner & Lucas. (*Consent.*)

Projecting pilasters to Nos. 231, 233, 235 and 237, Mare Street, Hackney, on the application of C. G. Smith, on behalf of W. Smith. (*Consent.*)

Buildings on the northern side of Uxbridge Road, westward of Providence Place, on the application of J. H. Richardson, on behalf of the Home Counties Land Co., Ltd. (*Consent.*)

Retention of a one-storey shop in front of No. 5, Brownhill Road, Catford, on the application of Norfolk & Prior, on behalf of J. Alder. (*Consent.*)

Extension of the period within which the erection of a porch in front of a proposed church on the south-eastern side of Torridon Road, Lewisham, was required to be completed, on the application of W. D. Church & Son. (*Consent.*)

Bathroom additions and a covered way on the south-west side of Grove Road, St. Marylebone, eastward of the Regent's Canal, on the application of J. P. Waddington, on behalf of the St. Marylebone Borough Council. (*Consent.*)

Houses on the north-western side of De Laune Street, Kennington, on the application of Briant & Son. (*Consent.*)

Projecting sign in front of No. 1, Burwood Mews, Burwood Place, Edgware Road, Paddington, on the application of Allen & Mannoch, Ltd., on behalf of the London and Parisian Motor Co., Ltd. (*Consent.*)

Bringing forward the frontages of No. 1, Hamilton Place, abutting upon Piccadilly, on the application of W. H. Romaine-Walker & Besant. (*Consent.*)

Deviation from the plans approved on April 18th, 1905, for the erection of two iron and glass shelters to the Royal Institute of Painters in Water Colours and Princes Restaurant, on the south side of Piccadilly, so far as relates to the affixing of the name of the premises to both sides of the shelter in front of Princes Restaurant, on the application of W. Emden. (*Consent.*)

Five blocks of cottages and shops, Franciscan Road, Tottenham, on the application of R. Robertson, on behalf of the Housing of the Working Classes Committee of the Council. (*Consent.*)

Retention of a porch in front of Spencer House, No. 27, Wimbledon Park Road, Wandsworth, on the application of Boyton, Sons & Trevor. (*Consent.*)

Warehouse building on the north side of Tenter Street, Moorfields, at less than the prescribed distance from the centre of the roadway of the street, on the application of Gregg & Detmar, on behalf of Raphael, Tuck & Son. (*Refusal.*)

Retention of an iron and glass covered way at the entrance to No. 3, Douro Place, Victoria Road, Kensington, on the application of Miss F. A. Lee. (*Consent.*)

Projecting chimney stack at No. 13, Golden Square, to abut upon Lower James Street, on the application of W. Woodward, on behalf of Rye & Eyre. (*Consent.*)

Building at the rear of No. 243, Uxbridge Road, Hammersmith, at less than the prescribed distance from the centre of the roadway of a mews leading out of the east

side of Askew Crescent, on the application of Prickett & Ellis, on behalf of Miss S. Axton. (*Consent.*)

Buildings abutting upon the western side of Godfrey Street, the southern side of Godfrey Hill, and the eastern side of Lower Wood Street, Woolwich, on the application of G. A. Wilkinson & Son. (*Consent.*)

Wood and glass showcase at No. 221, Regent Street, to abut upon Argyle Place, on the application of F. Sage & Co., Ltd., on behalf of T. & J. Perry. (*Refusal.*)

One-storey addition in front of No. 4, Hyde Park Gardens Mews, Paddington, on the application of G. Trollope & Sons and Collis & Sons, Ltd., on behalf of J. G. Griffiths. (*Refusal.*)

New street for carriage traffic out of the east side of Ravensbourne Park, Catford, on the application of Norfolk & Prior. (*Consent.*)

Building on the western side of Beaumont Road, Wandsworth, on the application of A. J. Hardwick. (*Consent.*)

Building at the rear of No. 9, Fawley Road, Hampstead, to abut upon Honeybourne Road, on the application of C. G. Durrant, on behalf of Dr. G. Elam. (*Refusal.*)

Raising of projecting one-storey shops in front of Nos. 168 and 170, Edgware Road, St. Marylebone, on the application of J. W. Stevens, on behalf of E. S. Burns. (*Refusal.*)

Retention of a building at the rear of No. 35, Thornhill Road, Islington, with a forecourt boundary at less than the prescribed distance from the centre of the roadway of the southern arm of Barnsbury Square, on the application of F. J. Eedle & Meyers, on behalf of T. Heath. (*Consent.*)

Five new streets for carriage traffic on the Sanders estate, on the south-east side of Coldharbour Lane, Brixton, on the application of R. Ellis & Son, on behalf of R. A. Sanders. (*Refusal.*)

Modification of the provisions of that section with regard to open spaces about buildings, so far as relates to a building erected on the north-east side of Hall Road, Peckham, abutting upon Hichison Road, on the application of C. Farley. (*Consent.*)

Two-storey factory building over a part of the space at the rear of Nos. 47 and 49, Norman Road, Bow, on the application of A. P. Stokes, on behalf of C. J. Russell. (*Consent.*)

Buildings on a part of the space at the rear of No. 6, Nelson Square, Blackfriars Road, Southwark, on the application of R. C. Murray, on behalf of Sidney Straker & Squire. (*Consent.*)

Conversion of Nos. 6 and 7, George Street, Hanover Square, into a domestic building, on the application of C. H. Worley, on behalf of T. Stevens. (*Refusal.*)

Building on the site of Nos. 13, 15 and 17, Dod Street, Limehouse, on the application of H. Herman, Ltd. (*Consent.*)

Views and Reviews.

Modern Buildings.

The first volume of this new publication has just been published, and judging from this it appears to be an important and very useful addition to the text-books on building construction. It has been designed to provide instruction in the very latest developments of building construction. The editor, Mr. G. A. T. Middleton, who has been a frequent contributor to our columns, remarks upon the want of a book dealing with planning and construction, which go hand in hand in practice correlatively. Mr. Middleton has the assistance of a staff of contributors, and as there will be six volumes the work will be a large one—which, indeed, the subject warrants. This first volume deals with general office practice and draughtsmanship in the first part, the planning of cottages and country houses in the second part, and with ordinary constructional details in the third part. There are numerous coloured plates, which are a valuable feature, for only by such means is it possible to show the method of preparing working drawings. In connection with the part devoted to construction in this volume there are many useful drawings, which are most clearly prepared and show numerous practical details not ordinarily found in text-books, such as bonding in all sorts of special circumstances, scaffolding, shoring, needling and underpinning, roofs of peculiar shape, &c. We shall have occasion to refer from time to time to the other volumes of this work as they appear.

"Modern Buildings: Their Planning, Construction and Equipment." Volume I. Edited by G. A. T. Middleton, A.R.I.B.A. London: The Caxton Publishing Co., price 10s. 6d. nett per volume.

Obituary.

Mr. Zephaniah King, F.R.I.B.A., senior partner in the firm of Messrs Zephaniah King & Son, architects, Westminster, died on February 24th, at Harrow, aged 71.

THE PORT OF BRISTOL.

A New Town.

THE port of Bristol is approached by a tortuous channel about seven miles long up the tidal River Avon from its mouth in the Severn Channel. The mercantile population has long desired a development of the districts lying nearer the mouth of the river, but until recent years these have remained more or less untouched. With the opening of the first Avonmouth Dock some years ago a small township was created here, but local facilities of access and transport were so backward that things remained in a stationary condition until recently, when a renewed interest was taken in the subject of the transference of shipping business to the mouth of the river, due to some extent to the interest displayed in the matter by Messrs. Elder, Dempster & Co., who made Avonmouth the port of call for their American and African trading steamers. The Bristol Corporation, a very conservative body, were at last stimulated to action, and after having exhaustively considered the reports of eminent engineers upon the various alternative methods of improving the port, such as the dockization of the river itself and the formation of docks on the north or the south bank of the river, finally decided upon a scheme for creating large dock accommodation at Avonmouth; and at the same time took steps to improve the existing facilities for

access and communication between the two centres, causing this district to be included in the municipal area—now much enlarged by the absorption of several outlying districts.

The alluvial land at Avonmouth, with the rising ground of Shirehampton, forming altogether a district of about four square miles in extent, and known as the Kingsweston Estate, is owned practically in its entirety by Mr. Philip Napier Miles, J.P., lord of the manor of Kingsweston, on whose property the future township of Avonmouth will be almost entirely built.

Mr. Miles sold 200 acres of his land adjoining the foreshore to the Bristol Corporation, on which they are now completing the large dock which has been for the past two or three years in course of construction, and which will probably be opened in less than two years' time. The railway companies whose line serves the present dock are now doubling the line, and a direct connection to London is projected, which will involve the creation of an important terminus here.

Mr. Napier Miles has laid out a series of excellent roads, furnished with public sewers, whilst complete plans exist for their extension hereafter. A light railway for the distribution of goods as well as for passenger traffic has also been inaugurated, which will be linked with the existing railway at either end, thus bringing the projected manufacturing and warehousing area into direct touch with the railway communication.

It is Mr. Miles's intention that the new

township, which it is confidently anticipated will shortly undergo a large development, shall be controlled on architectural lines, so that it shall possess that unity and dignity of character which is necessarily lacking in the majority of commercial centres, where conflicting interests as well as the absence of any central authority in matters of taste render it impossible to procure anything approaching unity of effect in the architecture of the public thoroughfares.

To this end he has appointed Mr. Frederick Bligh Bond, of Star Life Building, Bristol, consulting architect for all work done on the estate, and it will be Mr. Bond's duty to confer with all intending building owners with a view to the regulation of the external character of their projected buildings, in order to ensure harmony and a certain degree of conformity with the destined character of the place.

Building work has been going on now with increased activity for the past three years, and a large number of artisans' dwellings and shops have been erected, together with a few buildings of superior character, these latter including the Kingsweston Estate Offices (illustrated in THE BUILDERS' JOURNAL for December 27th last) and the Shirehampton Parish Hall and Carnegie Library, both built from the designs of Mr. Bligh Bond; and the "Miles' Arms" at Avonmouth, built from plans prepared by Messrs. Paul & James, architects, of Bristol, the elevations having been furnished by Mr. Bond.

THE STUDENTS' SPRING DAY-DREAMS.

DRAWN BY E. G. W.

Complete List of Contracts Open.

News of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our last issue of other contracts that still remain open.

Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Mar. 8. Grays.—*Shed for the steam roller in Stanley Road, for the Urban D. Council.* Tenders, endorsed "Steam Roller Shed," to be delivered to Hatten & Asplin, clerks of the Council, High Street, Grays, by noon on Mar. 8.

Mar. 8. Treharris.—*Levelling, excavating and laying-out of land fronting Thomas Street and Mary Street for football and cricket ground.* Plans and quantities may be seen at the office of R. Edwards, Pantanas Estate Office, Treharris, to whom tenders must be sent by Mar. 8.

Mar. 8. Letterkenny, Ireland.—*Teacher's residence, for the Select Vestry of Conwall Parish Church.* Plans and specifications to be seen at the office of John M'Intyre, architect, Letterkenny. Tenders to be sent to Major Downe, Letterkenny, by Mar. 8.

Mar. 8. Abenbury.—*Additions at the Council School to accommodate thirty-two children, for the Education Committee.* Specifications and plans can be inspected at the office of the county architect and surveyor, Walter D. Wiles, 42A, High Street, Wrexham. Tenders, endorsed "Tender for Abenbury School," to be delivered to Evans & Roberts, sects., Education Offices, Ruthin, by Mar. 8.

Mar. 8. Dipton.—*Primitive Methodist church and schools.* Builders desirous of tendering are requested to send their names to Davidson & Phillipson, architects, Pearl Buildings, Newcastle-on-Tyne, by Mar. 8.

Mar. 8. Chard.—*Factory annexe, for Messrs. Boden & Co.* Application to be made to Symes & Madge, architects and surveyors, Somerset House, Chard, on or before Mar. 8. Quantities and full particulars will be supplied on deposit of cheque value £3 3s.

Mar. 9. Sedburgh.—*Residence, for B. Wilson.* Plans may be seen and quantities and specifications obtained from John F. Curwen, F.S.A., F.R.I.B.A., architect and sanitary engineer, 26, Highgate, Kendal, to whom tenders must be sent by noon on Mar. 9.

Mar. 9. Weymouth.—*Enlarging the fire-station and executing alterations at the rear of same for the purposes of a picket house, in accordance with plans and specification to be seen at the offices of the Borough Surveyor and Engineer, Clarence Buildings, Weymouth.* Sealed tenders, endorsed "Alterations to Fire-station," to be delivered at the Town Clerk's Office, Weymouth, by 10 a.m. on Mar. 9.

Mar. 10. Berrington.—*Re-building the wall round the teacher's garden, for the Managers of Berrington School.* It is partly a retaining wall, and must in any case be brickwork up to the ground-level of the garden, above this 2 ft. either of gin. brickwork or of iron railing. Tenders may be for either or both of these alterations, and must specify proposed quality and dimensions of all parts, concrete foundation, brickwork, and in the case of iron railing the method of attachment to top of brick wall. The old material may be used, but not on face of wall; the top three courses to be built in cement. Tenders, marked outside, "Tender for Wall," to be sent to James Cavan, Eaton Mascot Hall, Shrewsbury, by Mar. 10.

Mar. 10. Breinton.—*Alterations and additions to Breinton manor-house.* Drawings may be seen and quantities, form of tender and other particulars obtained at the offices of Groome & Bettington, architects and surveyors, Palace Chambers, Hereford, upon payment of £2 2s. Tenders must be upon the forms supplied and be delivered at the offices of the Architects, enclosed in a sealed cover marked "Tender for Alterations, &c., Breinton Manor House," by noon on Mar. 10.

Mar. 10. Cilcennin.—*Alterations and repairs to the school, for the Cardigan County Education Committee.* Plans and specifications or copies of the same can be seen either at the school building, in charge of the headmaster, or at the office of G. Dickens-Lewis, county architect, 12, Terrace Road, Aberystwyth. Tenders, sealed and endorsed "Cilcennin School Repairs," are to be delivered at the office of B. C. Jones, clerk to the District Education Committee, Aberayron, by noon on Mar. 10.

Mar. 10. Ciliau Park.—*Alterations and repairs to the school, for the Cardigan County Education Committee.* Plans and specifications or copies of the same can be seen either at the school building, in charge of the headmaster, or at the office of G. Dickens-Lewis, county architect, 12, Terrace Road, Aberystwyth. Tenders, sealed and endorsed "Ciliau Park School Repairs," are to be delivered at the office of B. C. Jones, clerk to the District Education Committee, Aberayron, by noon on Mar. 10.

Mar. 10. Dihewid.—*Alterations and repairs to the school, for the Cardigan County Education Committee.* Plans and specifications or copies of the same can be seen either at the school building, in charge of the headmaster, or at the office of G. Dickens-Lewis, county architect, 12, Terrace Road, Aberystwyth. Tenders, sealed and endorsed "Dihewid School Repairs," are to be delivered at the office of B. C. Jones, clerk to the District Education Committee, Aberayron, by midday on Mar. 10.

Mar. 10. Rhydpennau.—*Alterations and repairs at the school, for the Cardigan County Education Committee.* Plans and specifications or copies of the same can be seen either at the school building, in charge of the headmaster, or at the office of G. Dickens-Lewis, county architect, 12, Terrace Road, Aberystwyth. Tenders, sealed and endorsed "Rhydpennau School Repairs," are to be delivered at the office of R. J. Roberts, clerk to the District Education Committee, Cambrian Chambers, Aberystwyth, by noon on Mar. 10.

Mar. 10. Goginan.—*Alterations and repairs to the school, for the Cardigan County Education Committee.* Plans and specifications or copies of the same can be seen at the school building, in charge of the headmaster, or at the office of G. Dickens-Lewis, county architect, 12, Terrace Road, Aberystwyth. Tenders, sealed and endorsed "Goginan School Repairs," are to be delivered at the office of R. J. Roberts, clerk to the District Education Committee, Cambrian Chambers, Aberystwyth, by noon on Mar. 10.

Mar. 10. New Bolsover.—*Infants' school, for the Derbyshire County Council.* Applications for bills of quantities, accompanied by a deposit of £1 1s., must be made to H. Tatham Sudbury, architect, Estate Offices, Ilkeston, by Mar. 10.

Boston.—*Reconstruction and reseating of gallery, and for new rostrum in the Centenary Wesleyan Chapel, for the Trustees.* Quantities may be obtained upon application to Gelder & Kitchen, architects, Hull. The plans will be on view at Messrs. Beaulah's office, Bargate, Boston. Sealed tenders, endorsed, to be delivered to the Rev. J. W. Keyworth, Buxton Villa, Boston, by 5 p.m. on Mar. 10.

Mar. 10. Cork.—*New wing to the Convent of the African Missioners at Blackrock Road, Cork, and for building a new laundry and other works, for the Very Rev. Joseph Zimmerman, Superior, in accordance with plans and specification prepared for same, and which may be inspected at the office of James F. M'Mullen, architect, 30, South Mall, Cork, with whom sealed tenders are to be lodged by Mar. 10.*

Mar. 10. London, S.W.—*Completion of transepts, choir vestries and choir-room of a London church, S.W. district.* A selection will be made from the names received by the committee, and the selected firms will then be invited to tender. Bills of quantities are being prepared by Fowler & Hugman, 9, Adam Street, Adelphi, W.C. For further particulars apply to the architects, Rowland Plunbe & Harvey, F.R.I.B.A., 13, Fitzroy Square, London, W., to whom all applications to tender must be addressed and delivered by Mar. 10.

Mar. 12. Salford.—*Office and waiting-room near Trafford Bridge, for the Tramways Committee.* Further particulars and form of tender may be obtained on application at the Tramway Offices, 32, Blackfriars Street, Salford, where plans may be seen. Tenders, endorsed "Receiving Office, Trafford Bridge," and addressed to the Chairman, Tramways Committee, to be delivered to L. C. Evans, town clerk, Town Hall, Salford, by 3 p.m. on Mar. 12.

Mar. 12. Aberdare.—*Forty dwelling-houses, together with streets sewers and surface water-drains, on part of Forchamman Farm, Cwmaman, for the Cwmaman Coal Co., Ltd.* Plans and specifications may be seen at the offices of Morgan & Elford, architects, 1, Jeffrey Street, Mountain Ash, or 42, Canon Street, Aberdare, to whom endorsed tenders are to be sent by Mar. 12.

Mar. 13. Tattingstone.—*Structural alterations and repairs at the Workhouse, for the Guardians of the Samford Union.* Plans and specifications can be seen at the Workhouse or at the office of H. J. Wright, architect, 4, Museum Street, Ipswich. Tenders to be delivered to Arnold J. Haward, clerk, 34, Princes Street, Ipswich, by Mar. 13.

Mar. 13. Over.—*New infant school in High Street.* Plans and specifications can be seen at the office of H. Beswick, county architect, Newgate Street, Chester, and quantities obtained on deposit of £1 1s. Sealed tenders, endorsed "Tender for New Infant School," to be delivered to John H. Cooke, clerk to the Education Committee, Winsford, Cheshire, by 10 a.m. on Mar. 13.

Mar. 14. Chippenham.—*Infant school at Wood Lane, and alterations and additions to the Westmead Schools, Wood Lane.* Copies of the bills of quantities will be supplied on application (accompanied by a deposit of £1 1s.) to Silcock & Reay, architects, 47, Milsom Street, Bath, where the drawings, specifications and conditions may also be seen. Sealed tenders, endorsed "Tenders for the New Infant School, Chippenham, and Alterations and Additions to the Westmead Schools, Chippenham," to be addressed to W. Pullinger, Director of Education, Education Department, County Offices, Trowbridge, by noon on Mar. 14.

Mar. 15. Newport.—*Mission-house and children's home, for the Clewer Sisters of the Community of St. John Baptist.* Bills of quantities may be obtained upon deposit of £2 2s. and drawings inspected at the offices of W. Bucknall, architect, 123, Knights Hill Road, West Norwood, London, S.E., and Henry J. Griggs, architect, 381, Metropolitan Bank Chambers, Newport, Mon.

Tenders to be sent to J. Moxon, solicitor, Newport, by noon on Mar. 15. The Committee do not bind themselves to accept the lowest or any tender.

Mar. 15. Stourbridge.—*Alterations and additions to the Stream Farm, Wordsley, including new living room, bedroom, bath-room and dairy, for the Guardians.* Plans and specifications may be obtained on application at the Guardians' Office, 12, Hagley Street, Stourbridge. Tenders to reach George Francis James, clerk to the Guardians, Union Office, 12, Hagley Street, Stourbridge, by Mar. 15.

Mar. 15. Wimbledon.—*Extension of the slipper baths, Latimer Road, for the Corporation.* Plans and specifications may be inspected and bills of quantities obtained on deposit of £2 2s. at the Borough Surveyor's Office, Town Hall. Sealed tenders, addressed to the "Chairman, Baths Committee," and endorsed "Tender for Baths Extension," must be delivered to C. H. Cooper, M.I.C.E., engineer and surveyor, Town Hall, Wimbledon, by noon on Mar. 15.

Mar. 16. Nottingham.—*Sanatorium for females suffering from phthisis at Bagthorpe Workhouse.* Particulars and quantities may be obtained on application to Arthur Marshall, A.R.I.B.A., architect, King Street, and on payment of £3 3s. Tenders must be delivered to G. Muncaster Howard, clerk to the Board, Poor Law Offices, Shakespear Street, Nottingham, by Mar. 16.

Mar. 16. Merthyr Tydfil.—*Boys' school at Georgetown, for the Education Committee.* Drawings and specification may be seen and copies of bill of quantities obtained at the office of the Committee's architect, J. Llewellyn Smith, Central Chambers, High Street, Merthyr Tydfil, on deposit of £2 2s. Sealed tenders, endorsed "Georgetown Boys School," to be sent to E. Stephens, clerk to the Committee, Town Hall, Merthyr Tydfil, by 5 p.m. on Mar. 16.

Mar. 17. Beckenham.—*Second portion of the Church of St. Michael and All Angels, to ultimately accommodate 700 persons.* Those wishing to tender should apply to the architect, A. H. Hoole, 36, Great James Street, Bedford Row, W.C., on or before Mar. 17, after which date bills of quantities and forms of tender will be sent on payment of £1 1s.

Mar. 20. Bangor (co. Down).—*Concrete foundations for a telescopic gasholder, at the Gasworks, Bangor, Ireland.* Copy of plans and specification may be obtained from the Clerk to the District Council, on payment of 10s., not returnable. Tenders will be received by James Milliken, clerk to the Council, Town Hall, Bangor, co. Down, up to noon on Mar. 20.

Mar. 21. Chipping Ongar.—*School buildings at the Children's Homes at Chipping Ongar, for the Hackney Guardians.* The specification, conditions of contract and plans (as prepared by W. A. Finch, architect, of 76, Finsbury Pavement, E.C.) may be seen at the Clerk's Office by persons desirous of tendering, and bills of quantities (as prepared by G. T. G. Wright, quantity surveyor, of 3, Great Winchester Street, E.C.) and form of tender will be furnished upon deposit of the sum of £5. Sealed tenders, endorsed "Erection of School Buildings, Chipping Ongar," must be delivered at the Clerk's Office, Hackney Union, Homerton, N.W., by 2 p.m. on Mar. 21.

Mar. 21. East Barnet.—*Additions and alterations to the Margaret Road County Council School.* Drawings, specification, agreement, &c., may be seen at the County Surveyor's Office, Hatfield, between 10 and 4 (Saturdays from 10 to 12). A copy of the schedule of works and prices (quantities) and a form of tender can be obtained at the County Surveyor's Office upon payment of £2 2s. Sealed tenders, endorsed "Tender for Additions and Alterations to Margaret Road C.C. School, East Barnet," must be delivered to Urban A. Smith, county surveyor, County Surveyor's Office, Hatfield, by 5 p.m. on Mar. 21.

Mar. 22. Old Trafford.—*Public elementary school at Northumberland Road, for the Education Committee.* Plans may be seen and bill of quantities obtained on application to the architect, Ernest Woodhouse, 88, Mosley Street, Manchester, on payment of £2 2s. Tenders, endorsed "Northumberland Road Council School," to be addressed to the Chairman of the Sites and Buildings Sub-committee, Council Offices, Old Trafford, and delivered by noon on Mar. 22.

Mar. 31. Grange, Ireland.—*Renovation of Grange National School.* Plans and specification to be had from Rev. J. Connell, B.A., Donaghedy, Strabane, to whom tenders are to be sent by Mar. 31.

No date. Rochdale.—*Bridge to be constructed in ferro-concrete, with other incidental works, such bridge to be about 26ft. span, and to carry a road 14yds. wide, over the Rochdale Canal at Firgrove.* Contractors must hold the licence of L. G. Mouchel, of 38, Victoria Street, Westminster, S.W., to execute such work on the Hennebique system of ferro-concrete. Forms of tender, specification and bill of quantities may be obtained on deposit of £5 at the office of the Borough Surveyor, Town Hall, Rochdale.

ENGINEERING.

Mar. 8. Hamilton.—*Filters and tank* and other relative works at Stoneymeadow, for the District Committee of the Middle Ward of the county of Lanark. Plans may be seen and copies of the specification and schedule obtained at the office of the engineers, J. & A. Leslie & Reid, C.E., 72a, George Street, Edinburgh, on payment of £1. Tenders, endorsed "Tender for Contract No. 71," must be lodged with W. E. Whyte, district clerk, District Offices, Hamilton, by Mar. 8.

Mar. 9. Oswaldtwistle.—*New 12-ton compound steam road-roller*, for the Urban D. Council. For further particulars apply to the Surveyor to the Council, Town Hall, Oswaldtwistle. Tenders, endorsed "Tender for Steam Road-Roller," must be sent to B. T. Westwell, clerk to the Council, Town Hall, Oswaldtwistle, Lancashire, by Mar. 9.

Mar. 9. Newry.—*Repairs and keeping in good condition* the steam boilers in connection with the Workhouse, for one year from April 1. All new materials required to be supplied by the contractor. Sealed tenders must be lodged with W. R. Bell, clerk of the Union, Clerk's Office, Workhouse, Newry, by 5 p.m. on Mar. 9.

Mar. 12. Alnwick.—*Duplicating the covered service reservoir* at Sturton Grange, to hold 35,000 gallons extra, for the Rural D. Council. Plans and specifications may be seen at the office of the clerk, H. W. Walton, Alnwick, to whom sealed tenders, endorsed "Reservoir," are to be delivered by 7.30 p.m. on Mar. 12.

Mar. 13. Nuneaton.—*Service reservoir*, capacity 500,000 gallons, in Hennebique's ferro-concrete construction, for the Urban D. Council. Plans and specification may be seen and form of tender obtained on application at the Council Offices, Nuneaton. Tenders, endorsed "Tender for Reservoir," must be delivered to E. C. Cook, waterworks engineer, Council Offices, Nuneaton, by noon on Mar. 13.

Mar. 13. Stockport.—*Side-planing machine*, for the Gas Committee. Full particulars may be had on application to the engineer, S. Meunier Gasworks, Stockport. Tenders to be addressed to the Chairman of the Gas Committee, care of Town Clerk, Stockport, endorsed "Planing Machine," and delivered by Mar. 13.

Mar. 15. Pretoria.—*Refuse destructor*, capable of treating 60 tons of refuse per diem, for the Municipality. Tender forms, specification of the destructor, dimensions and levels of the site upon which it will be erected may be obtained on application to the Town Engineer, Pretoria, or at the office of Mosenthal, Sons & Co., 72, Basinghall Street, London, E.C. Fair wages clause. Tenders, enclosed in sealed envelopes, and endorsed "Tenders for Supply and Erection of Refuse Destructor at Pretoria," must reach the Town Clerk, Pretoria, not later than noon on April 6, or Mosenthal, Sons & Co., 72, Basinghall Street, E.C., by Mar. 15.

Mar. 20. London, S.W.—*Seven electrically-operated car trawlers*, for the London County Council. Specification, drawings, form of tender, and other particulars, may be obtained at the County Hall, Spring Gardens, S.W., upon payment to the Cashier of the Council of the sum of £2 for each specification. Each tender is to be delivered at the County Hall in a sealed cover, marked "Tender for Electrically-operated Traversers, L.C.C. Tramways," and addressed to the Clerk of the London County Council, Spring Gardens, S.W., by Mar. 20.

Mar. 20. Greenock.—*Refuse destructor plant*, for the Corporation. The general conditions, specification, drawings and form of tender may be obtained from the Burgh Electrical Engineer, Greenock, on deposit of £2 ss. Extra copies of specification may be obtained on payment of 5s. each, which will not be returned. Tenders, endorsed "Contract No. 19, Refuse Destructor Plant," must be delivered to C. MacCulloch, town clerk, Municipal Buildings, Greenock, by midday on Mar. 20.

Mar. 24. Hythe.—*Well sinking* at Bluehouse, in the parish of Saltwood, and lining same with brickwork and cast-iron cylinders, for the Corporation. Plans and sections may be seen and specification, form of tender and schedule of quantities obtained on application to Chris. Jones, borough engineer Bank Buildings, Hythe, Kent, upon payment of a deposit of £2 ss. Sealed tenders, endorsed "Tender for Well Sinking," to be delivered to Geo. S. Wilks, town clerk, Town Clerk's Office, High Street, Hythe, Kent, by Mar. 24.

April 25. Valparaiso.—*Harbour works*. The date for opening tenders for the Valparaiso harbour works has been postponed from April 2 until April 25 next. Plans and particulars may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

May 7. Sydney, N.S.W.—*Electric-lighting plant*: (a) Boilers, automatic stokers, pipe-work, &c., (b) turbo-alternator, sub-station machinery, switchboards, &c., for the Municipal Council. Specifications, plans and form of tender may be obtained on application to T. Rooke at the offices of Preece & Cardew, 8, Queen Anne's Gate, Westminster. A deposit of £5 ss. will be required on application, and a cash deposit or marked cheque for the sum of £1,000 will be required when the tender is sent in. Sealed tenders, endorsed "Tender for Electric Lighting Plant," are to be addressed to the Town Clerk, Town Hall, Sydney, and must be delivered by 4 p.m. on May 7.

IRON AND STEEL.

Mar. 8. Hamilton.—*Cast-iron pipes*, for the District Committee of the Middle Ward of the county of Lanark, as follows:—80 tons of 12in., 6in., and 4in. dry sand cast-iron pipes and relative special castings. Copies of the specification and schedule may be obtained at the office of the engineers, J. & A. Leslie & Reid, C.E., 72a, George Street, Edinburgh, on payment of £1. Tenders, endorsed "Tender for Contract No. 72," must be lodged with W. E. Whyte, district clerk, District Offices, Hamilton, by Mar. 8.

Mar. 14. London, E.C.—*Steel posts, &c.*, for fencing, galvanized eye-bolts and strand-wire, for fencing, for the East Indian Railway Co. For each specification a fee of £1 is charged, which cannot under any circumstances be returned. Tenders, marked "Tender for Steel Posts, &c., or as the case may be," must be sent to C. W. Young, Secy., Nicholas Lane, E.C., by noon on Mar. 14.

PAINTING AND PLUMBING.

Mar. 9. Newry.—*Repairs and keeping in good condition* for one year, from April 1, the gas pipes and brackets, mangles, drying closets, vats, grates, stench traps, pumps, cisterns, ranges, stoves, waterclosets, bath tubs, weighbridges, metal sashes, quadrants, ventilators, cocs s and all lead and metal pipes, lead valleys, gutters, spouting, and all manner of plumbing work whatsoever, in connection with the workhouse and fever hospital. The upkeep of the telephone connection between the workhouse and fever hospital will be included in this contract. All new materials required to be supplied by the contractor. Sealed tenders must be lodged with W. R. Bell, clerk of the Union, Clerk's Office, Workhouse, Newry, by 5 p.m. on Mar. 9.

Mar. 14. London, S.E.—*External painting and repairs at the Norwood Schools*, for the Lambeth Board of Guardians. Specification and form of tender will be supplied on personal application and on payment of £2 in respect thereof. Tenders on the printed form, sealed and endorsed "Tender for Painting, &c., Schools," to be sent to the Guardians' Offices, Brook Street, Kennington Road, S.E., by 10 a.m. on Mar. 14. They will be opened at noon the same day, when all persons tendering or their agents must be in attendance.

ROADS AND CARTAGE.

Mar. 8. Carmarthen.—*Street works* as follows:—Levelling, metalling, paving, kerbing, channelling and making-up of Barnfield Terrace. Plans and specifications may be seen and forms of tenders obtained at the Surveyor's Office, John Street. Tenders, endorsed "Street Works," are to be delivered to R. M. Thomas, town clerk, Town Clerk's Office, Carmarthen, by Mar. 8.

Mar. 8. London, N.E.—*Kerbing, channelling, paving, making-up, &c.*, of a portion of Baker's Hill, Clapton, for the Hackney Borough Council. General conditions of contract and the specification and plan and sections may be inspected, and copies of the bill of quantities and form of tender obtained, on application to Norman Scorgie, M.I.C.E., borough engineer and surveyor, and on payment of £1 rs. Tenders, sealed and endorsed "Baker's Hill," must be delivered at the Town Hall, Hackney, N.E., by 5 p.m. on Mar. 8. Fair wages clause.

Mar. 9. Aitcham.—*Cartage of stone and materials* upon the roads within the district for the year ending Mar. 31, 1907. Form of tender, containing full particulars, can be obtained from the surveyor, T. Fortune, Pontesbury, or from the Clerk, at the Council Offices. Tenders to be delivered to Joseph Everest, clerk, District Council Offices, St. John's Hill, Shrewsbury, by 4 p.m. on Mar. 9.

Mar. 10. Droitwich.—*Rowley rag* or other granite, for the Corporation, for the year ending Mar. 31, 1907. Forms of tender and all particulars may be obtained from H. Hulse, borough surveyor, to whom samples of the materials to be supplied must be sent not later than Friday, Mar. 9. Sealed tenders, on the Council's form of tender, endorsed "Stone," to be sent to S. J. Tombs, town clerk, Town Hall, Droitwich, by noon on Mar. 10.

Mar. 10. Stafford.—*Carting stone, &c.*, for the repair of the highways, from the various stations and canal wharves in the district, for the Rural D. Council. Printed forms of tender, containing full particulars, may be obtained from F. G. Herbert, surveyor, 9, Park Crescent, Wolverhampton Road, Stafford. All tenders must be on the printed forms supplied, and properly filled up and endorsed "Tender for Team Labour," and sent to William Morgan, clerk to the Council, 4, Martin Street, Stafford, by Mar. 10.

Mar. 12. Rye.—*Cartage, horse hire and steam rolling* for the year ending Mar. 31, 1907. Forms of tenders on application to H. J. Elliott, district surveyor, Winchelsea, Sussex. Tenders to W. Dawes, highways clerk, Watchbell Chambers, Rye, Sussex, by Mar. 12.

Mar. 12. Chichester.—*Hand-picked surface field flints* and best quality pit gravel, at per cubic yard, for the Westhamptnett Rural D. Council. Tenders, to be made only on forms containing conditions of contract to be obtained from W. D. Rasell, acting clerk, 5, South Street, Chichester, must be endorsed "Tender for supply and delivery of material," and sent to the Council Offices, 5, South Street, Chichester, by Mar. 12.

Mar. 12. Plomesgate.—*Granite*, broken to 1½in. gauge, and Kent ragstone, broken to 2in. gauge, to be delivered free in the following approximate quantities before July 31 next, for the Rural D. Council:—Granite: Aldeburgh station (G.E. Rly.) 100 tons, Framlingham station (G.E. Rly.) 950 tons, Marlesford station (G.E. Rly.) 70 tons, Parham station (G.E. Rly.) 50 tons, Saxmundham station (G.E. Rly.) 235 tons, Snape station (G.E. Rly.) 175 tons, Wickham Market station (G.E. Rly.) 300 tons, Kenton station (Mid-Suffolk Light Rly.) 40 tons. Kent Ragstone, in barges at: Orford Quay 375 yds., Iken Cliff, River Alde, 125 yds., Butley Mill Wharf, River Alde, 100 yds. Tenders, with samples, to be sent to T. W. Read, clerk, Wickham Market, Suffolk by Mar. 12.

(Continued on p. xiv.)

Trade and Craft.

High-class Joinery.

We illustrate herewith three examples of high-class joinery work executed by Elliotts' Moulding and Joinery Co., Ltd., of Newbury. This firm makes a speciality of architects' designs, and has laid down the most up-to-date plant for carrying out work in the best manner. Good joinery needs most careful attention to detail, and this is clearly evident in all Messrs. Elliotts' work, the management being under the personal control of Mr. E. Buckingham, managing director. The joinery at the Gravesend branch of the Capital and Counties Bank, carried out under the direction of Mr. G. Clay, A.R.I.B.A., is all in Austrian oak. In connection with this bank it is also to be noted that Messrs. Elliotts executed the fittings for the head-office in Threadneedle Street, London, which is a good example of high-class work. The beautiful screen, organ case and confessionals at St. Etheldreda's Church, Ely Place, furnish another fine example of joinery, executed immediately under Bentley's direction: while the choir stalls at All Saints', Tooting (by Mr. Leonard Stokes), are a further example of a similar kind. The Imperial Restaurant in Regent Street, London, is one of Messrs. Elliotts' pieces of work, in Italian walnut, as also the Wycliff Hall Chapel at Oxford, in oak. The firm have recently issued a new catalogue called "The Architect Series" giving full details of mouldings of every description that can be worked in both soft and hard woods. None but thoroughly dry and seasoned woods are used, and amongst the whole of Messrs. Elliotts'

CHOIR STALLS, ALL SAINTS' CHURCH, TOOTING, EXECUTED BY ELLIOTTS' MOULDING AND JOINERY CO., LTD., FROM DESIGNS BY LEONARD STOKES. F.R.I.B.A.

large stock it would be difficult to find such a thing as a third-quality board. They hold the reputation of being manufacturers of the highest class of mouldings, these being particularly clean and sharp.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

SCREEN, CONFESSIONAL AND ORGAN CASE AT ST. ETHELDREDA'S, ELY PLACE, LONDON. THE LATE J. F. BENTLEY, ARCHITECT.

A NEW AND IMPORTANT WORK.

"MODERN BUILDINGS

THEIR

PLANNING, CONSTRUCTION, AND EQUIPMENT."

By G. A. T. MIDDLETON, A.R.I.B.A.,

VICE-PRESIDENT OF THE SOCIETY OF ARCHITECTS. (Assisted by numerous Special Contributors.)

The most comprehensive book upon building ever published, forming, as it does, a complete library in itself, full of accurate information upon thousands of subjects of the utmost importance to all engaged in building work.

A Few of the Thousands of Subjects dealt with:—

PLANNING.

Domestic Planning—including Cottages, Villas, and Bungalows, Large Country Houses, Small and Large Town Houses, Flats, Shops, and Offices.

Public Buildings—including Schools, Hospitals, Libraries, Town Halls, and Municipal Buildings, Public Baths.

Ecclesiastical Buildings—including Establishment Churches, Nonconformist Churches, and Supplementary Buildings.

Miscellaneous Buildings—including Theatres, Warehouses, Factories, Farmhouses, Stables, Dairies, and Bakeries.

CONSTRUCTION.

Masonry—simple and elaborate, including Domes, Vaults, and Buttresses, Traceried Windows.

Brickwork in English and Flemish Bond, Foundations, Footings, Arches, Chimneys, &c.

Carpentry and Joinery—from the roughest to the most elaborate work.

Tiling and Slating.

Plastering, Plumbing—both external and internal.

Bell-hanging—Wire Bells and Electric Bells.

Painting and Glazing—including Decorative Windows.

Shoring and Under-Pinning, and dealing with dangerous structures.

SPECIFICATION WRITING.

Model Specifications for a small cottage and for a large shop, properly arranged in all trades with notes.

QUANTITY SURVEYING.

Taking-Off—According to the three principal systems now in vogue, comparing their value under different circumstances.

Abstracting—or bringing into proper trade sequence.

Billing—and preparing the quantities for the estimator.

Checking Accounts and Measuring Variations.

OVER 1,500 ILLUSTRATIONS IN COLOUR, HALF-TONE, AND LINE.

A FREE BOOKLET.

It would be impossible in this announcement to set forth the many important features of this indispensable work, but we have prepared a **Free Descriptive Booklet**, which we shall send you post free on receipt of the form or a postcard.

STEEL & CONCRETE CONSTRUCTION.

The Theory of Steel Construction—Analytically and graphically considered.

Modern Steelwork—in Stanchions, Columns, Floors, and Roofs.

Armoured Concrete—explaining all the principal modern methods.

Fire-Resisting Construction—of all kinds for large and small work.

HEATING.

Hot Water Apparatus—for ordinary house work, in all its usual modifications.

Hot Water Heating—on low and high pressure, including the two-pipe, the one-pipe, and other over-head systems of low-pressure, and both limited and unlimited high pressure.

Steam Heating—in all its systems.

The Open Fire—particular attention being given to modern forms.

VENTILATION.

The Natural and Artificial Systems—theoretically and practically considered, with all the appliances illustrated and described which are in most general use, and the principal systems discussed.

LIGHTING.

Gas, Acetylene, and Electric Lighting—including the comparison of illuminating power and the methods of laying wires and pipes, fittings and fixtures, with a description of the plant necessary for private installations.

DILAPIDATIONS AND EASEMENTS.

Dilapidations—under the usual clauses of long leases.

Ecclesiastical Dilapidations.

Rights of Light—how obtained, and their limitations.

Rights of Support, &c.

SPECIAL FITTINGS.

For many Miscellaneous classes of Buildings, including Laboratories, Shops, Baths, &c.

THE CAXTON PUBLISHING CO.,

84, 85, and 86, Chancery Lane, London, W.C.

Please send me, FREE OF CHARGE, the Booklet giving full particulars of "**Modern Buildings: Their Planning, Construction, and Equipment.**"

(Continued from p. 135.)

Mar. 16. Preston.—*Street works* required in levelling, paving, flagging, channelling, &c., Tulketh Crescent and Wyre Street, for the Corporation. Plans, sections and specifications may be seen, and schedule of quantities and forms of tender obtained at the office of the Borough Surveyor, Town Hall, Preston, to whom sealed tenders, endorsed "Tender for Paving, &c.," must be delivered not later than noon on Mar. 16. Fair wages clause.

Mar. 16. Thaxted.—*Paving and gravelling, &c.*, of the playgrounds of the Thaxted Council School, for the Education Committee. Plan and specification, prepared by the county architect, Frank Whitmore, may be inspected at the school, Thaxted, between 9 and 4, any day except Saturdays and Sundays. A separate price must be given for the portion of work "tar-paved," and another price for the other portions of the playground. Sealed tenders, endorsed "Tenders, Thaxted School," must reach Stephen Giffard, clerk to the Sub-Committee, Great Dunmow, by Mar. 16.

Mar. 17. Palmer's Green.—*Making-up* of Eaton Park Avondale and Stondard Roads, at Palmer's Green for the Southgate Urban D. Council. Plans may be seen on application to the Council's Surveyor, Charles G. Lawson, from whom copies of the specification and forms of tender may be obtained on depositing £2. Tenders, endorsed "Private Streets," must reach W. M. Ellenor, clerk of the Council, Council Offices, Palmer's Green, N., by noon on Mar. 17.

Mar. 19. Stockton-on-Tees.—*Private street improvement works* required to be done in the paving, flagging, and kerbing of Norfolk Street (North End). Plans and specifications may be seen and quantities and forms of tender obtained from M. H. Sykes, borough engineer, Town Hall. Tenders, endorsed "Private Street Improvements," to be sent to Arthur B. Crossby, town clerk, Borough Hall, Stockton-on-Tees, by 10 a.m. on Mar. 19.

Mar. 20. Tending.—*Supply of the following quantities of flints* broken to 2in. gauge:—1,000 cub. yds. at Beaumont Quay, 500 cub. yds. at Clacton Beach, 1,750 cub. yds. at Mistley Quay, 100 cub. yds. at Great Oakley, 600 cub. yds. at Kirby Quay, 500 cub. yds. at Landmerrere, 500 cub. yds. at St. Osyth, 400 cub. yds. at The Flag, St. Osyth, 400 cub. yds. at Wrabness Hard, 200 cub. yds. at Harwich. Tenders are also invited for the supply of 400 tons of granite, broken to go through a 1½in. ring, to be delivered at Mistley. Tenders to be sent to J. Bell, highway surveyor, Great Bentley, Colchester, by Mar. 20.

Mar. 21. Hoo.—*Supply of the following materials*, for the Rural D. Council:—1,000 yds. of broken Kentish ragstone by barge or rail; also 350 yds. of broken Guernsey or Cornish granite or Cherbourg quartzite by barge or rail. The whole of such materials must be free from rubbish or haddock, and the granite and quartzite broken so as to pass through a 2in. ring and the ragstone through a 2½in. ring. Printed forms of tender may be obtained of Richard Phillott Smyth at Strood. Tenders to be sealed, endorsed "Tender for Ragstone, &c.," as the case may be, and addressed to Richard Phillott Smyth, clerk, Strood, by Mar. 21.

Mar. 25. Abertridwr.—*Construction of streets* at Abertridwr, near Caerphilly. Plans and specification may be seen and bills of quantities obtainable from G. A. Lunde, surveyor, 53, Queen Street, Cardiff, to whom tenders, sealed and endorsed "Streets," are to be delivered by Mar. 25.

SANITARY.

Mar. 11. Cleethorpes.—*Underground male and female conveniences* in Sea Road. Plans and sections and bills of quantities and forms of tender may be obtained on payment of £2. Sealed tenders (on forms supplied by the Council only) to be addressed to the Chairman of the Sanitary and Building Committee, and endorsed "Tender for Conveniences," to be sent to the Council House, Cleethorpes, by Mar. 11.

Mar. 12. Halifax.—*Works in connection with the sewage-disposal works*, for the Highways Committee of the Halifax Corporation:—Contract No. 3: The construction of bacteria beds and delivery and effluent channels. Contract No. 4: The supply and delivery of penstocks, sluice valves, and special castings for the above. Plans and specifications may be seen and forms of tender obtained on application to James Lord, M.I.C.E., borough engineer, Town Hall, Halifax, on deposit of £1. Tenders, endorsed "Bacteria Beds—Contract No. 3 or 4," as the case may be, must be sent to Keighley Walton, town clerk, Halifax, by Mar. 12. The persons whose tenders are accepted will be required to observe the fair contracts clauses adopted by the Corporation.

Mar. 12. Darvel.—*Sewerage and sewage purification works*, for the Town Council. The works comprise the providing and laying of about 1,250 yds. of 18in. 50 yds. of 15in., 750 yds. of 12in., and 305 yds. of 9in. fireclay pipe sewers, with all necessary manholes and flushing chambers, and the construction of sewage purification works about 1 mile to the westwards of Darvel, and other contingent works. Drawings may be seen at the office of P. Campbell Hart, C.E., 134, St. Vincent Street, Glasgow, from whom copies of specification and duplicate copies of schedule of quantities may be obtained on payment of £1. Sealed tenders, endorsed "Tender for Darvel Sewerage," to be lodged with Andrew Cameron, town clerk, Darvel, by noon on Mar. 12.

Mar. 12. Market Harborough.—*Sewage outfall works*, for the parish of Fleckney, consisting of concrete tanks, continuous filters, storm beds, carriers, distribution chambers, and about 800 lin. yds. of 9in. and 12in. stone-ware drains, for the Rural D. Council. Drawings may be inspected at the offices of the engineers, Everard, Son & Pick, 6, Millstone Lane, Leicester, from whom conditions, specification, quantities and form of tender may be obtained upon payment of £2. Sealed tenders, upon the form supplied, endorsed "Tender for Fleckney Sewage Works," to be sent to Charles Burgoin, clerk to the Council, Market Harborough, by 10 a.m. on Mar. 12.

Mar. 13. Colchester.—*600 tons of the best hand-picked Buxton or Derbyshire stone lime* for sewage precipitating purposes, for the Urban D. Council. The lime

to be delivered in good condition to the Hythe Station, Colchester, at the rate of about 2 tons per week. Specifications and forms of tender can be obtained upon application at the Borough Surveyor's Office. Sealed tenders, endorsed "Tender for Lime," to be delivered to Herbert Goodyear, A.M.I.C.E., borough engineer and surveyor, Town Hall, Colchester, by Mar. 13.

Mar. 14. Newport, Isle of Wight.—*Scavenging* at Bembridge, Bonchurch, Brading, Carisbrooke, Freshwater, Totland and Yarmouth, for the Rural D. Council. Copies of the contract can be obtained on payment of 1s., the charge for copying. Tenders in sealed envelopes, marked on the outside "Scavenging," Bembridge, Bonchurch, Brading, Carisbrooke, Freshwater, Totland or Yarmouth, respectively, to be delivered to H. Eldridge Stratton, clerk, Rural D. Council Offices, Pyle Street, Newport, I.W., by 5 p.m. on Mar. 14.

Mar. 15. Merthyr Tydfil.—*Effluent conduit.* Laying down and completing a 3ft. 6in. circular steel plate tube, about 380 yds. in length, and the contingent works for conveying and discharging the effluent stream from the Troedyrhiw Farm Lands. Plans and specification of the work may be seen and forms of tender obtained upon application to Thomas F. Harvey, borough engineer, Town Hall, Merthyr Tydfil. Sealed tenders, endorsed "Effluent Conduit," to be sent to W. R. Harris, Town Hall, Merthyr Tydfil, by Mar. 15.

Mar. 27. Barnet.—*For the following works* in connection with the Arkley sewerage, for the Barnet Urban D. Council:—2,627 yds. of 12in. stoneware pipe sewer, 800 yds. of 6in. stoneware pipe sewer, 208 yds. of 6in. stoneware pipe sewer, together with manholes, ventilating shafts, &c. Drawings and specifications can be seen on application to the Council's Surveyor, W. H. Mansbridge, 40, High Street, Barnet, any weekday between 9 and 4. Copies may be had on loan for three days upon the deposit of £1 1s. Tenders on the form provided, together with the schedule of prices properly filled in, to be properly sealed and endorsed "Arkley Sewer," and sent to H. W. Poole, clerk, Council Offices, 40, High Street, Barnet, Herts, by Mar. 27.

TIMBER.

April 3. London, S.W.—*Oregon pine.* The Crown Agents for the Colonies, acting on behalf of the administration of the Central South African Railways, invite tenders for the supply of about 97,000 cub. ft. of Oregon pine, known on the Liverpool market as "select quality." Forms of tender, with specifications and conditions of contract, may be obtained on application at the office of the Crown Agents for the Colonies, Whitehall Gardens, London, S.W., between 10 and 4 (Saturdays 10 to 1), on payment of a deposit of £1 per copy. Tenders to be delivered in sealed envelopes addressed to the Crown Agents for the Colonies, endorsed "Tender for Oregon Pine C.S.A. R.," by noon on April 3.

MISCELLANEOUS.

Mar. 12. London, W.—Supply of the following works and materials, for the Borough Council, for one year commencing April 1, 1906:—Horses, harness and drivers for street watering; night washing and sweeping machines; carting rubbish and one-horse carts; timber; broken granite; lime and bricks; footway kerb Yorkshire paving; Thames ballast and sand; glazed stoneware sewer pipes; pit flints, gravel and hoggins; tools and ironmongery; ironwork for sewers and iron castings; plumbers' work and materials; wood blocks for repairs; engineers' requirements, oils, &c. Tenders to be made upon and strictly in accordance with the printed forms of tender. Further particulars and forms of tender may be obtained on application at the Town Hall from 10 until 4 daily (Saturdays excepted). All tenders, sealed and endorsed "Tender for —," to be delivered to J. Wilson, town clerk, Town Hall, Marylebone Lane, Oxford Street, W., by 11 a.m. on Mar. 12.

Mar. 13. Grangetown.—Supply of the following materials, for the Eston Urban D. Council, for twelve months ending Mar. 31, 1907:—Highway material, whinstone and slag; team work; disinfectants; brooms and brushes; picks, pick points, shovels, &c.; oils, &c. Further information and forms of tender may be obtained on application to C. McDermid, district surveyor, Council Offices, Grangetown, S.O., Yorks. Sealed tenders (which must be on the forms provided), properly endorsed, together with samples, are to be delivered at the Council Offices by Mar. 13.

Mar. 13. London, E.C.—Supply of the following materials and stores, for the Council of the Metropolitan Borough of Shoreditch, for one year from April 1, 1906, to March 31, 1907 (inclusive):—Highways Works Department: Paving, repairing and relaying the footway and carriageway pavements within the borough, and the supply of materials; supplying and laying patent or manufacturing stone, or other paving material; asphalt; broken granite; plumbers' work; smiths' work; drain pipes, junctions, bends, &c.; drain rods, pails, ropes, &c.; timber; sewer ironwork and street posts; gas-fittings, &c., for the public lighting of the borough; lime cement, &c.; general cartage; street name plates, notice boards, writers' work, &c.; ballast, hoggins, shingle and sand. Scavenging and other Departments: Iron, ironmongery. Electricity Works Department: (a) Electric cables and sundries; (b) gas pipe and fittings; (c) engineers' stores. Forms of tender for all the above-mentioned articles can be obtained on application to the Town Clerk. Tenders must be sent to H. Mansfield Robinson, town clerk, Shoreditch Town Hall, Old Street, E.C., by 3 p.m. on Mar. 13.

Mar. 13. Eccles.—Supply of the following materials for the year ending Mar. 31, 1907, for the Corporation:—Setts (Lankey paving, crossing, flag rock, grit, no granite; flags: best and second barns; flags: concrete; flags: manhole, lampeye and gully; kerbs: rough, straight and circular; channel stones: straight and circular; broken rubble; granite macadam and chippings; prepared pit limestone; limestone cube chippings; gravel; pit or river; castings: pitch, creosote and tar; Simpson's patent street gulleys; stoneware passage gulleys; stoneware pipes, bends and junctions; mortar. Forms of tender and particulars may be obtained upon application to Thomas S. Picton, C.E., borough surveyor. Sealed tenders, which must be enclosed in an official envelope endorsed "Tender for Highway Materials," must be forwarded to Edwin Parkes, town clerk, Town Hall, Eccles, by noon on Mar. 13.

Mar. 13. Preston.—Supply of the following materials, for the Corporation:—Cast-iron pipes of various sizes; special castings for same; also manhole covers, step-irons, street gulleys and other irregular castings; lamp pillars, as per sample; sluice valves, double faced, various sizes; best salt-glazed socketed pipes, in 2ft. lengths, of various sizes, from 4in. to 24in. internal diameter; bends, junctions, syphons, yard sinks, taper pipes, &c.; brooms; refilling street-sweeping machine with circular brush; oil, white lead, paint and putty; 21 oz. glass, cut to pattern. Specification, form of tender, and all other information may be obtained on application at the offices of the Borough Surveyor, Town Hall, Preston, to whom sealed tenders, addressed to "The Chairman of the Finance Committee" and endorsed "Tender for Stores," must be sent by noon on Mar. 13. Fair wages clause.

Mar. 13. London, W.C.—Supply of the following materials, for the Holborn Borough Council, for a period of twelve months from April 1 next:—Disinfectants; stone; gravel, sand and ballast; cartage of materials; hire of road-rollers; iron castings; gasfitters' and engineers' work; lime, cement and bricks; drain-pipes; brooms; builders' work; smiths' work, and the supply of tools, implements, &c. Forms of the several contracts may be seen and forms of tender and other particulars obtained at the Town Clerk's Office, 197, High Holborn, W.C. Separate sealed tenders for all or any of the above-mentioned works and materials, endorsed "Tender for —," together with the names and addresses and callings of two proposed sureties, must be delivered to Lionel Walford, town clerk, Council Offices, 197, High Holborn, W.C., by noon on Mar. 13.

Mar. 13. Belfast.—Supply of the following stores, for the Works Committee for one year:—Earthenware sewer pipes; timber; hardwood; iron castings; plumber's work; nails, &c.; iron and steel; paints and oils; glazing; mill furnishings; shovels, spades, grapes; scavenging brushes; glazed bricks; artificial flags; lime; pitch, felt, tar, and cement. Forms of tender and particulars may be had in the Superintendent of Works' Office, Townhall Street. Sealed tenders on official forms only, endorsed "Tender for —," to Samuel Black, town clerk, Belfast, by 10 a.m. on Mar. 13.

Mar. 13. London, E.—Supply of the following stores, for the Poplar and Stepney Sick Asylum District, for the use of the asylum at Devon's Road, Bromley, London, E., and also for the branch asylum at Blackwall, E., from April 1 next for twelve months:—Brushmaker, earthenware, ironmongery, electrical stores, timber, building material and plumbers' material. Printed forms of tender, which alone can be received, and which will contain an estimate of the quantities required and the directions to be observed by the parties tendering, may be obtained at the Clerk's Office at the asylum daily, between 10 and 4 (Saturdays 10 and 1), or will be sent by post upon receipt of a stamped addressed foolscap envelope, and the same must be returned to Walter R. Foskett, clerk to the Managers, Clerks' Offices, Bromley-by-Bow, E., by 10 a.m. on Mar. 13.

Mar. 14. Newcastle-on-Tyne.—Supply of the following materials, &c., for the Town Improvement and Streets Committee during the twelve months ending Mar. 31, 1907, viz.:—Sanitary pipes; cement; oils and paints; clot lime; lime-mortar; road stones; Calithness flags; freestone flags; artificial flags; granite paving stones; granite kerb stones; pitch, tar and creosote oil; iron, steel and horse-shoe nails; shovels; disinfectants; gully grates, ventilator covers, &c.; scavenging brooms, &c.; privy pans; timber; lead washings; bricks. Forms of tender may be obtained on application at the City Engineer's Office, Town Hall. Sealed tenders, addressed to the "Chairman of the Town Improvement and Streets Committee," and endorsed "Tender for Stores," must be left at the Committee Clerk's Office, Town Hall, by Mar. 14.

Mar. 14. Aylesbury.—Supply of the following materials and stores, for the Urban D. Council, for the year ending Mar. 31, 1907:—Road metalling; 1½in. machine-broken granite and ¾in. chippings; heavy hard hand-picked flints; coarse gravel and fine hoggins. Building materials: glazed stoneware pipes, traps and gulleys; Portland cement; blue lime; ground lime; stock bricks; Leighton sand; fine slag. Disinfectants. Ironwork: street lamp columns and cradles; copper street lanterns; manhole and lamp-hole covers and gully grates; cast-iron ventilating columns; air-inlet gratings for drains. Tools, stores, &c.: Incandescent mantles; steel picks and shovels; sharpening and repairing ditto. Labour: manual labour for various trades and team labour. Specifications and forms of tender may be obtained on application to W. H. Taylor, surveyor to the Council, Town Hall, Aylesbury. Sealed tenders on the prescribed form, and endorsed "Tender for —," must be delivered to Percy A. Wright, clerk, Town Hall, Aylesbury, by 4 p.m. on Mar. 14.

Mar. 14. Colchester.—Supply of the following materials, for the Electricity Supply Committee of the Corporation, during the year ending Mar. 31, 1907:—Ironmongery; oils; oilman's sundries; castings. Patterns and samples must be seen at the Electricity Works, Osborne Street. Forms of tender and conditions of contract may be obtained at Borough Electrical Engineer's Office. Sealed tenders, marked respectively with the particulars to which they relate, to be sent to the Chairman of the Electricity Supply Committee, Town Hall, Colchester, by 10 a.m. on Mar. 14.

Mar. 15. Croydon.—Supply of the following materials, for the Rural D. Council:—Broken Guernsey granite; dug and hand-picked flints and fine gravel; cartage of flints, granite and gravel; hire of horses and carts for scavenging and highways purposes; hire of horses and carts for general carting; tar paving; kerbing, pitching and channelling; tools, brooms, manhole covers and gully grates, &c.; Portland cement; lime; stoneware pipes, gulleys, &c. Forms of tender, specifications, and conditions of contract can be obtained on application to E. J. Gowen, clerk, District Council Offices, Town Hall, Croydon, and samples of the tools, &c., can be seen at the

Vestry Hall, Mitcham, and any other particulars can be obtained by applying to the Surveyor, Town Hall, Croydon, or Vestry Hall, Mitcham. Sealed tenders, endorsed "Tender for —," must be delivered at the Clerk's Offices, Town Hall, Croydon, before noon on Mar. 15.

Mar. 15. Walsall.—Supply of the following materials, for the Rural D. Council, from April 1, 1906, to Mar. 31, 1907:—Broken furnace slag; broken granite; machine and paraffin oils; castings; bricks; cement; disinfectants; stoneware pipes, &c. Forms of tender may be obtained at the District Surveyor's Office. Tenders, endorsed "Supply of Materials" to be sent in, along with samples carriage paid, to W. P. Young, district surveyor, Council Offices, Rushall, Walsall, by Mar. 15.

Mar. 15. Reading.—Supply of the following stores for the Corporation, for twelve months ending Mar. 31, 1907:—Granite and other stone for macadam; Norwegian granite kerb and channel; paving setts; wood blocks for street paving; gravel and Thames ballast; cement and glazed stoneware drain pipes; lamp standards, lanterns and ladder irons; cast-iron gulleys and gratings, sewer manhole frames and covers; bass, rotary and other brooms and brushes; petroleum and other oils, paint, &c.; tools and ironmongery, &c. Forms of tender on application at the Borough Engineer's Office, Town Hall, Reading. Separate sealed tenders on the forms supplied for each class of goods, suitably endorsed according to the class of goods, &c., to John Bowen, A.M.I.C.E., borough engineer and surveyor, Town Hall, Reading, by noon on Mar. 15.

Mar. 15. London, W.—Supply of the following materials, for the Guardians of the parish of Fulham, for twelve months:—Oils and colours; brushes; earthenware; ironmongery. Forms of tender, containing full particulars and conditions, with estimates of quantities required, may be obtained on application at the Guardians' Offices, Fulham Palace Road W., or by forwarding a stamped addressed foolscap envelope. Samples and patterns of the goods can be inspected at the same place between 10 and 12 and 2 and 4 daily. Tenders, properly endorsed and accompanied by samples (where required), must be delivered to E. J. Mott, clerk to the Guardians, Guardians' Offices, Fulham Palace Road, Hammersmith, W., by 10 a.m. on Mar. 15.

Mar. 17. Burnley.—Supply of the following materials, for the Corporation:—Setts (local), flags, kerb, channel, bricks (red), gravel, granite macadam, cement, pitch, creosote, earthenware pipes, ironwork (street grates, &c.), lime, limestone, &c. Specifications and forms of tender may be obtained on application at the Borough Surveyor's Office, Town Hall, Burnley. Sealed and endorsed tenders, addressed to "The Chairman of the Highways and Sewage Committee," must be left at the Town Clerk's Office, Town Hall, Burnley, by Mar. 17.

Mar. 17. Wimbeldon.—For the following works, materials, &c., during year ending Mar. 31, 1907:—Borough Surveyor's Department: Broken granite, granite kerbs and quadrants, granite cubes and pitchings, flints and fine binding gravel, concrete, gravel and sand, iron castings, street gulleys and drain pipes, Portland cement, lime, tools, ironmongery, paints, colours and varnish, timber in bulk, timber in small quantities and wheelwrights' timber. Forms of specification and tender, with conditions of contract, may be obtained on application to the Borough Surveyor, Town Hall, Wimbeldon. Electricity Department: Engine-room stores, cables, joint boxes and jointing material, transformers, meters, lubricating oils, incandescent electric lamps, carbons and accessories, castings, and firebricks and fireclay. Forms of specification and tender, with conditions of contract, may be obtained, and samples inspected, on application to the Chief Electrical Engineer, Electric Light Works, Durnsford Road, Wimbeldon. Sealed tenders, endorsed "Tender for —," to A. Steele Sheldon, town clerk, Town Clerk's Office, Wimbeldon, by Mar. 17.

Mar. 17. Burnley.—For the supply of the following materials, for the Highways and Sewage Committee:—Setts (local); flags; kerb; channel; bricks (red); gravel; granite macadam; cement; pitch; creosote; earthenware pipes; ironwork (street grates, &c.); lime; limestone. Specifications and forms of tender may be obtained on application at the Borough Surveyor's Office, Town Hall, Burnley. Sealed and endorsed tenders, addressed to "The Chairman of the Highways and Sewage Committee," must be left at the Town Clerk's Office, Town Hall, Burnley, by Mar. 17.

Mar. 20. Wembley.—Supply of the following materials, for the Urban D. Council, for the year ending Mar. 31, 1907:—Engine and boiler requisites; street-lighting requisites; roadmen's tools, brooms, &c.; also for about 1,200 tons of broken granite, 300 tons of gravel, 300 tons of hoggins and 600 tons of slag. Forms of tender and schedules can be obtained from the Clerk, Public Offices, Wembley, by forwarding a stamped addressed foolscap envelope. Tenders must be enclosed in the envelopes supplied and delivered to W. Bagshaw, clerk to the Council, Public Offices, Wembley, by noon on Mar. 20.

April 10. Cape Town.—Cupboard locks. For the supply of 3in. 4-lever brass cut cupboard locks, L. hand, with two keys each, no key to open two locks. A sample of the class of lock required may be inspected on application to the Controller of Stores, General Post Office, Cape Town, or the Agent-General for the Cape Colony, 100, Victoria Street, London, S.W. All tenders must forward a sample lock, which should be addressed to the Controller of Stores, G.P.O., Cape Town. The locks are to be supplied in quantities of at least 200 at a time, and must be equal in every respect to the sample lock, including the position of keyhole. The contract is to commence on the 1st July 1906, and to terminate on the 30th June, 1909, but either of the contracting parties will be at liberty to terminate the same on giving two months' notice, in writing, to that effect. Tenders addressed, "Tenders for Locks," will be received at the Controller and Auditor General's Office, Parliament Street, Cape Town, until noon on April 10.

New Council Schools at Gloucester, in Calton Road, were opened last Wednesday. The buildings consist of three blocks, and comprise mixed school, infants' school and cookery and laundry centre, with separate playgrounds for boys, girls and infants. The mixed school provides accommodation for 500 pupils in ten classrooms arranged round a central hall 61ft. by 32ft., with separate entrances, cloakrooms and lavatories for boys and girls, and rooms for head and assistant teachers and school store on each side. The infants' school accommodates 310 children in

six classrooms, also grouped round a central hall 56ft. by 25ft., with cloakroom and lavatories, &c. The cookery and laundry block has distinct accommodation for each department, both containing general schoolroom, cloakroom and lavatory. The builders' work has been carried out by Messrs. J. Byard & Sons, contractors, of Gloucester, from designs by Mr. Walter B. Wood, A.R.I.B.A., of Gloucester. The entire cost of the building, with furniture and fittings, will probably amount to about £14,000.

Duke of York's Royal Military School.—The architect of the new school at Dover—the old one at Chelsea being given up—is Sir Henry Tanner, I.S.O., F.R.I.B.A., principal architect to H.M. Office of Works. The building contractors are Messrs. A. Hudson & Co., of Westminster.

London Master-Builders' Association.—Mr. J. W. Lorden (of Messrs. W. H. Lorden & Sons) is the new president of this Association; Mr. F. L. Dove (of Messrs. Dove Brothers, Ltd.) senior vice-president; and Mr. W. Lawrance (of Messrs. E. Lawrance & Sons), junior vice-president. Executive council:—Mr. G. Appleton (of Messrs. Turtle & Appleton), Mr. F. Bywaters (of Messrs. Bywaters & Sons, Ltd.), Mr. E. J. Hill (of Messrs. Higgs & Hill, Ltd.), Mr. Leonard Horner (of Messrs. Ashby & Horner), Mr. F. G. Minter, Mr. F. P. Rider (of Messrs. T. Rider & Son), Mr. H. J. Shelbourne (of Messrs. J. Shelbourne & Co.), and Mr. Howell J. Williams (of Messrs. Howell J. Williams, Ltd.).

Much for Little. PEEL must be a happy place, where labour is done for love and building materials grow by the roadside. In these days of striving after the simple life it is encouraging to know that there is a spot in the kingdom which has attained it. The Town Commissioners by their conditions of competition seem confident that they can get a library and a caretaker's residence and a front boundary-wall and railings, all for £500; so confident, indeed, that if any estimate is more than 5 per cent. "astray" the competitor will be liable to forfeit his remuneration. The premium offered is £10 and the selected design is to become the absolute property of the Commissioners. Should the successful competitor be employed to carry out the work, 5 per cent. will be paid for plans, specification and superintendence, but the £10 will merge in the commission and will not be in addition to it. All plans are to be accompanied by a very fully written

description of the work. Each competitor may send in one or more designs. There is no mention of a professional assessor. If ever the happy day arrives when architects work together in unity as members of a cohesive body, such a competition as this would be impossible; it would die in the bud, like a seedling, for lack of nourishment. As things are, it matters not whether the field of practice offers grapes or thistles there are always fools enough to gather the latter regardless of ultimate discomfort.

How to discover Flaws in Tie-rods.

OUR readers will recollect Sir Benjamin Baker's statement that his reason for recommending the demolition of the roof at Charing Cross station after the collapse that occurred was the impossibility of detecting by any practical test an interior flaw in a tie-rod. Although a defect might be discovered by a laboratory experiment, this would be very difficult, and quite impossible of adoption in the case of an existing roof. The suggestion, however, occurred to us that it might be possible to detect flaws in metal structural members by electrical means, and we put the suggestion before a well-known electrical engineer, Mr. Harold Hastings, A.M.I.C.E., M.I.E.E., of Messrs. Callender, the noted large cable makers and electrical contractors, and he expressed the opinion that it is not only possible to discover flaws electrically, but that it is comparatively easy and practicable. He states in a letter to us that "the bar should be cleaned at the ends and in the centre, the exact centre being obtained by fairly accurate measurement. A current is then passed between the centre and each end alternately, so that the conductivity of one half of the bar can be tested against the other. If there is any great variation it will show immediately that a flaw exists in the half of the tie-bar which gives the greatest resistance. This half should then be cleaned in short sections of equal length, and all the short sections compared. It will soon be seen which gives the greatest resistance, and this will be the one in which the flaw is located. Again, by comparing tie-bars of equal length and section, it will be easy to see whether any of them are excessively corroded throughout their length as compared with the rest. Moreover, the apparatus required is very simple. As a matter of fact, it is a standard set used for localising faults on mains. It consists of a set of 60 ampère-hour accumulators, four being placed together in a box (total weight about 40 lbs.), and having a handle suitable for carrying purposes. In another box is placed a double-pole change-over switch of very small dimensions, an ammeter, a rheostat, and a galvanometer. For the purpose of testing ties, three gun-metal clamps should be added to the outfit, so that a thoroughly sound connection can

be made upon the clean space prepared on the tie-bar. The object in having a rheostat in circuit is to enable the current to be adjusted to a suitable amount for different thicknesses of bars. It is quite possible to calculate the exact useful section of the tie-bar, provided that a sample of the material is available. The sample should be turned up in a lathe to a known diameter, and a convenient length of it tested. This can then be used as a unit to compare with the tie-bars." We need hardly point out the great utility of such a method of testing. There are many structures about the country in which there is the possibility of flaws existing, and it is important for the safety of the public to be assured.

Foreign Lead.

WE continually hear of examples of foreign competition in connection with commodities used in the building trades. The latest instance of foreign manufactures driving out English goods is afforded in connection with white lead. At the ordinary general meeting of Walkers, Parker & Co. it was stated that "the total quantity of white lead imported last year was 15,173 tons, of which Germany and Holland contributed 10,527, Belgium 4,060, France 336, United States of America 200, and other countries 50 tons. In addition, Germany exported 2,000 tons to Canada; so that, out of the whole 17,000 tons odd, Germany and Holland made over 12,000. Further, in 1905 Germany exported 16,477,500 kilos of white lead, out of which England received 10,117,900 kilos and Canada 1,836,400; so that England and her great colony took nearly three-quarters of the whole of Germany's exported white lead." We have not yet lost the trade in blue lead, sheets and pipes, although there are indications of coming competition. At present foreign competition seems to be under some disadvantage, the weights and sizes not fitting our trade, but these are sure to be altered shortly. This and other threatened industries show that there is *prima-facie* evidence to warrant a most careful enquiry into our fiscal policy, but we feel that this particular instance is only another to be added to the list of chemical manufactures which Germany has been able to secure by her better scientific training, although a good deal of this white lead is still produced by the old stack method. The factor, then, which must enable foreign competition to succeed, is that the factories are larger and the labour cheaper.

ROYAL ACADEMY EXHIBITION, 1906.

THE sending-in day for architectural works is Friday, March 30th, from 7 a.m. to 10 p.m. as hitherto. Will architects let us have their drawings as early as possible.

TESTING OF REINFORCED
CONCRETE BEAMS.

IN a paper entitled "Reinforced Concrete Beams: Theory and Experiment," read by Mr. William Blackadder, B.Sc., C.E., Harbour Engineer's Office, Aberdeen, before "The Aberdeen Association of Civil Engineers," various methods of calculating the strength of this type of construction as developed by well-known authorities were explained, and it was shown how these might be tabulated or represented graphically by curves so as to be suitable to rapidly enable the designer to proportion a beam to carry the load required. The effect of neglecting the tensile strength of the concrete, the strength of double reinforcements, and the economic proportions of beams were also dealt with, and a summary of this portion of the paper will be given in a future issue.

The latter part of the paper dealt with the actual testing of beams made by the author, all facilities for making the beams and tests being kindly granted by Mr. R. Gordon Nicol, M.Inst.C.E., Harbour Engineer. In most experiments made by engineers and constructors the beams are loaded directly with bars, usually of cast-iron, and it must be evident that this method cannot—unless great care be taken in the manner of loading—be accurate even to practical requirements, owing to the interlocking of the cast-iron bars used. Many photographs of experiments so conducted show this interlocking to a great degree; in some cases the load would almost remain self-supporting even though the beam were removed owing to most careful interlocking of the bars. This method also entails a large amount of labour unless the beams are of small size. To obviate the labour, and to obtain a true result as to the breaking load of any beam by subjecting it to a correctly estimated bending moment, the following testing machine was designed. It was made entirely out of old timber used in temporary works round the harbour, and the loading was done with cast-iron bars from the same source. It will be seen that it is merely a compactly arranged lever—in fact, in action exactly similar to the ordinary "nut cracker."

Figs. 1, 2 and 3 are elevation, plan and cross-section of the machine. A is a lever consisting of two pitch-pine piles 12ins. by 12ins. and 22ft. long, bolted together just as taken out of a cofferdam, held at one end by a chain c to the lower beams D and loaded at the long end by cast-iron bars W. By the prolongation of beams D to beyond the end of the lever there could be no overturning

of the machine about either end. B represents a beam to be tested, and the way in which the load is transferred to the beam at points a a through the transfer beam (pitch-pine) T is clearly shown and needs no explanation.

Though constructed of old materials and only a temporary testing machine, yet considerable accuracy was obtained. The lever was weighed, and balanced to find the actual centre of gravity; the chain had shackles on each side to admit of adjustment so as to keep the lever "floating" level; under the lever was put rocker R₁, made of jarrah wood, to allow free motion of lever and prevent load being transferred to one edge of the test beam if lever were out of the horizontal; and a similar rocker R₂ was put under R₁, to keep the load central on transfer beam, in the case of any tendency of the lever to rock sideways. T is the transfer beam which loads the test beam at two points a a equidistant from centre of span; at these load points on test beam were put rockers, R₄ on drawing, of 3/4 in. steel plates and 2 in. round bar to freely allow for deflection of test beam; similar rockers were placed at supported ends of test beams to allow the end of the beam to cant freely when deflection took place. These are shown at R₃.

Measurements of the lever arm of machine, and position of cast-iron bars (which were previously weighed) were taken, and so, knowing the span and position of load points a a, the actual bending moment applied to the beam, and thus its strength as a girder under any loading, were both very closely obtainable. In the application of the machine the lever was first raised by two screw jacks S₁ and S₂, the test beam and all rockers were then put

in place; screw jack S₂ was first slacked away, allowing lever to rest on the beam with a slight cant upwards to the long end; the chain was then just tightened by the two shackles and screw jack S₁ slackened off, so permitting the full load of the lever to come on the beam. Cast-iron bars were then added at the long end till the test beam broke, allowing the long end to come down on stop S. To show the remaining strength in a reinforced beam, it may be stated that after the breaking of a beam and formation of a large tension crack in the lower side, on removing cast-iron weights at the end of the lever it rose again free off the stop S, thus being still wholly supported by the broken test beam.

The test beams were 8ins. by 8ins. by 6ft. 8ins. span, and of concrete 1 cement, 2 sand, 3 of 1/2 in. to 3/4 in. granite; reinforced from 1/4 to 1 1/2 per cent. (some with inclined shear resisting bars), and broke under loads agreeing well with the theory of calculation advanced in the paper. Expanded metal and concrete slabs were also broken by the machine. These had expanded metal No. 8 in the lower side, and were 3ins. thick. They were loaded centrally, and also gave results agreeing well with the strength of such slabs as calculated by the theory proposed in the paper.

It may be said that loading directly is a more practical estimate of the strength of a beam, since in actual structures there may be the same probability of interlocking of the loads as in experiments so conducted. But if we are to found a principle of calculation on theory corroborated by tests on actual beams, then we require to find the true strength of a beam under a definite load—to find what is termed its true moment of

Fig. 3

Fig. 1

Fig. 2

resistance; then, if we wish to allow for the probable interlocking effect in an actual structure (which may vary largely in different cases), we can deduct a proportion of the load before designing the beam, or adopt a lower factor of safety. Such a machine as the above will determine the true strength of a given beam—not perhaps so accurately as a laboratory testing machine—but, even though rough and ready, yet to a degree accurate enough when dealing with so uncertain a material as concrete.

THE CEMENT TRADE.

New Bill to be introduced in the interests of Workers.

A NEW measure, drafted in the interests of cement-workers, is shortly to be introduced in the House of Commons. The Bill is promoted by the National Amalgamated Union of Labour, and the material for drafting it has been supplied by Mr. Terah E. Smith, of Gravesend, representing the London, Thames and Medway district of that union. The proposed Act will be known as "The Cement Works, Lime Works and Chalk Quarries Regulation Act, 1906." Amongst its provisions the following may be cited:—

In every cement works and in every lime works and chalk quarry the material used in the process of manufacture of cement or lime shall be truly weighed or measured at such state in the process of manufacture and generally in accordance with such rules as shall be prescribed by a Secretary of State.

The persons employed by piecework in any cement works, lime works or chalk quarry may, at their own cost, station a person (in the Act referred to as a check-weigher) at each place appointed for the weighing or measuring of the material, in order that he may take a correct account of the weight or measurement of the material, as the case may be. A check-weigher is to be given every facility for performing his duties, but he may not impede or interrupt any process of manufacture, or interfere with the weighing or measurement, or with any workmen, or with the management of the works. If the owner or manager desires the removal of a check-weigher on the ground of interference, he can complain to a court of jurisdiction, who, if of opinion that there is sufficient *prima-facie* ground for the removal of the check-weigher, may call upon the workmen to show cause against his removal. Then, if at the hearing the complaint is found to be justified, the court may make a summary order for the removal of the check-weigher.

Every Act for the time being in force relating to weights and measures shall extend to weights, measures, scales, balances, steel-yards and weighing machines used in any cement works, lime works or chalk quarry, in checking or ascertaining the wages of any person employed therein.

In every cement works, lime works or chalk quarry the owner or manager shall, for the purpose of enabling each person who is employed on piecework to compute the total amount of wages payable to him in respect of his work, furnish in writing to each person so employed particulars of the rate of wages applicable to the work to be done by such person at the time when the piecework commences, provided that if the same particulars are applicable to the work to be done by all the persons employed in the same room, shed or yard, it shall be sufficient to exhibit them in that room, shed or yard on a placard not containing any other matter, and posted in a position where it is easily legible.

Any person guilty of an offence against this Act shall be liable on summary conviction to a fine not exceeding £20.

OUTSIDE TENDERS.

Interesting Discussion at Gloucester.

THE important question affecting the acceptance of tenders by local authorities was once again discussed in connection with the deputation from the general building trades of Gloucester which waited recently upon the city council in regard to unemployment. Mr. S. T. Davies, of the Amalgamated Society of Carpenters and Joiners, who opened the case for the deputation, said their object was to call attention to the great depression prevalent in the building trade, and more particularly amongst carpenters and joiners. The question of unemployment had been growing upon them, and during the last three or four years their experiences had been very distressing. No doubt there were many causes for this. Some thought speculative building was largely responsible for the period of depression, but he himself thought there was room for speculative building, particularly if the builders could be encouraged to undertake such work in times of slackness. Some time ago it was urged that the Derby Road Council school building contract should be kept in Gloucester. They failed in that, and what was predicted had followed. Of 200 society men representing the two societies of carpenters and joiners, one-third, or between sixty and seventy, were unemployed. During the last two or three years these societies had spent about £600 in out-of-work pay in Gloucester. They had relieved the poor-rate burden on the citizens to that extent, but of course the resources of the societies were limited. Their object in coming to the council was not to seek charity but to ask that the council should do what they could in finding employment.

Local Tenders.

The deputy-mayor, in reply, said with reference to the contract for the erection of the Derby Road school, the education committee did all they could to place the work in the hands of a local firm, but the difference between the amount of the tender of the lowest local man and that of the builder to whom the contract was given was, in round numbers, £1,000. In those circumstances the education committee felt that they had no option but to recommend the acceptance of the lowest tender, which recommendation was unanimously endorsed by the council. However much they might regret the want of employment on the part of one section of their fellow citizens—and every one of them did regret it most sincerely—they felt they would be wanting in their duty to the other sections of the community if they gave away so large a sum as £1,000 out of the rates merely for the purpose of putting the contract into the hands of a local man. At the same time, while the committee recommended the acceptance of the lowest tender, they made special stipulations with the builder in question that the work should be done as far as possible by local workmen.

A Question of Domestic Economy.

Mr. Harland-Bowden said the point which had been raised involved what might be described as purely a question of "domestic economy." They had to consider whether or not they were going to face, every time they placed a contract at a lower sum outside the city, the setting-up of expensive methods for assisting local workmen who were out of employment. Did it not look as if they might save the city money by paying a certain amount more to local contractors, rather than by giving work at lower prices to outside firms?

The deputy-mayor said that if the policy referred to by Mr. Harland-Bowden were intended to be followed it should be clearly stated in the advertisements. For what purpose did they advertise for tenders? For the

purpose of getting work done at the expense of the ratepayers at the lowest possible cost, with a due regard for efficiency. In doing that they entered into an implied contract with those who tendered that, other things being equal, the lowest tender would be accepted. If they intended to exclude what he might call "foreign" tenderers, they ought to say so, and only advertise in the local papers. If the council desired to advertise so as to make known generally that they were prepared to accept tenders, and implied that they were going to take the lowest, they must honourably fulfil the conditions of the advertisement, and they must not go and intrigue and negotiate with one builder behind the backs of the other contractors to reduce his tender because he was a local man or because he was anything else. They must keep faith with the public at large; otherwise they would be sure to suffer very severely in the cost which they would have to pay for the execution of their local work. They did in all their contracts stipulate for fair wages—according to the local standard—to be paid to the workmen who were employed in carrying out those contracts, and for proper working hours to be complied with. But if it were proposed to go further and to give a premium to local men to tender for the work which they had from time to time to execute, all he could say was they must be prepared for a very large increase of the rates, because they must expect a very large increase in the amount of the tenders if they were limited in that way.

Mr. Harland-Bowden said he did not mean to imply that local contractors should receive a premium. What he desired was that in considering such a question members should endeavour to look at it from the point of view of a balance-sheet with a view to ascertaining on which side the greater advantage lay. Let them put on one side the difference between the tenders of the local and outside contractors, and on the other side the extra cost added to the rates for the relief of men who were out of employment.

Figures.

Mr. Fream said that as Mr. Harland-Bowden had raised the question of a balance-sheet, he would point out that the total amount to be paid in wages to carpenters and joiners in connection with the Derby Road school was about £1,500. If the whole of the contract had been carried out in Gloucester probably that amount would have been distributed amongst the carpenters and joiners of the city. But, as it was, a large proportion of that amount must necessarily be spent amongst the carpenters and joiners of Gloucester, because there was certain work—including the fixing of the roof timbers, floor-laying, &c.—which must be done in the city. The amount which would be lost in wages to local men was not £1,000—the difference between the accepted and the lowest local tender. The amount which would be lost in wages would be that which would be paid at Swindon for the making of joinery which would be fixed at Gloucester.

Alderman Fielding, referring to the subject of tendering for city work, said they must not forget that a large number of men were employed in Gloucester in doing work for various parts of the country. His own firm had a tender with the London County Council for £9,000. If the practice of fair and open tendering were to be discontinued local firms would have no chance of competing for work outside Gloucester, and the workmen of the city would be injured quite as much, if not much more, than they would be benefited by the adoption of such a restrictive policy.

The question was referred to the Estates and General Purposes and the Streets Committees.

FIRST-FREMIATED DESIGN FOR HACKNEY CENTRAL LIBRARY, HENRY A. CROUCH A.R.I.B.A. ARCHITECT.

First Floor Plan

Second Floor Plan (continued)

Ground Plan

Basement Plan

HACKNEY LIBRARY COMPETITION.

THE 152 designs for the new central library which is to be built in Mare Street, Hackney, London, are on exhibition this week at the Hackney Baths from 2 to 8.30 p.m.

The award of the assessor (Mr. J. W. Simpson, F.R.I.B.A.), is as follows:—
1st (£52 10s.), Mr. Henry A. Crouch, 12, Gray's Inn Square, W.C.

2nd (£31 10s.), Messrs. Davidson & Trimnell, of Adam Street, Adelphi, W.C.

3rd (£21), Messrs. Crouch, Butler & Savage, Birmingham.

We reproduce in this issue the three premiated designs.

First-premiated Design.

In this design a departure has been made from the usual type of plan, a stack-room thoroughly well lit being provided immediately adjoining the counter for serving books. No height is wasted in this room, enabling light to be obtained on either side of the newsroom and children's room, and also cross-ventilation. The indicators are well lit on either side, while storage accommodation is provided for 30,000 books on this floor, allowing nine books to the foot run on stacks nine shelves high. In the news-room slopes are provided on three sides, giving accommodation for fifty-two newspapers, while seventy-two readers can be seated at sloping tables in the centre. The children's room will accommodate forty-eight children. Shelving is shown for 2,000 books in this room, while books can be served from the stack-room on application. Owing to the number of readers at tables provided in the newsroom, it is suggested that trade periodicals, building papers, &c., should be placed there rather than in the magazine rooms. These rooms are consequently somewhat smaller than would otherwise have been the case. Accommodation is provided in the magazine rooms for 40 men and 40 women, or 60 men and 20 women, as desired. These are under the control of an attendant, who also controls the reference library. This latter is lighted entirely from the top, the whole of the walls being given up to the storage of books: 10,000 can be housed in this room, allowing 8 books to the foot run in cases 8 shelves high. Accommodation is provided for 70 readers, and communication is arranged with the basement stores. With regard to lavatory accommodation, it is considered that this should be provided for the public using only the reference library, and joint cloak and lavatory accommodation is shown for the reference readers and the board, the former having access only on application. In the basement there is a large area for storage, as it is understood old cellars occupy the site. Heating is proposed to be by low-pressure hot water with low-pressure hot-water ventilating radiators, direct cross-ventilation being provided in the children's and newsrooms, while flues will be provided in the walls for carrying off the foul air when the windows are closed. The reference room and magazine room will be heated in a similar way, and ample ventilation will be provided in the glass barrel ceiling in a trunk in which an electric fan will be placed. It is proposed to face the building with Monk's Park stone and red brick, the construction being fire-resisting throughout, with coke-breeze floors finished in Ebnerite or some similar composition, and the glass roof to be Helliwell's patent glazing. Stairs of Granolithic. The building comprises 254,413 cub. ft., which, allowing 11d. per cub. ft. for the superstructure, 5d. for the basement and stack-room, and £350 for heating and ventilation, gives a total of £10,066.

The second-premiated design, by Messrs. Davidson & Trimnell, is estimated to cost £9,905; and the third, by Messrs. Crouch, Butler & Savage, £10,175.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Architectural Association was held on Friday at 18, Tufton Street, Westminster, Mr. John Murray, vice-president, presiding.

Messrs. J. B. Scott and P. W. Pocock, junr., were elected members of the Association.

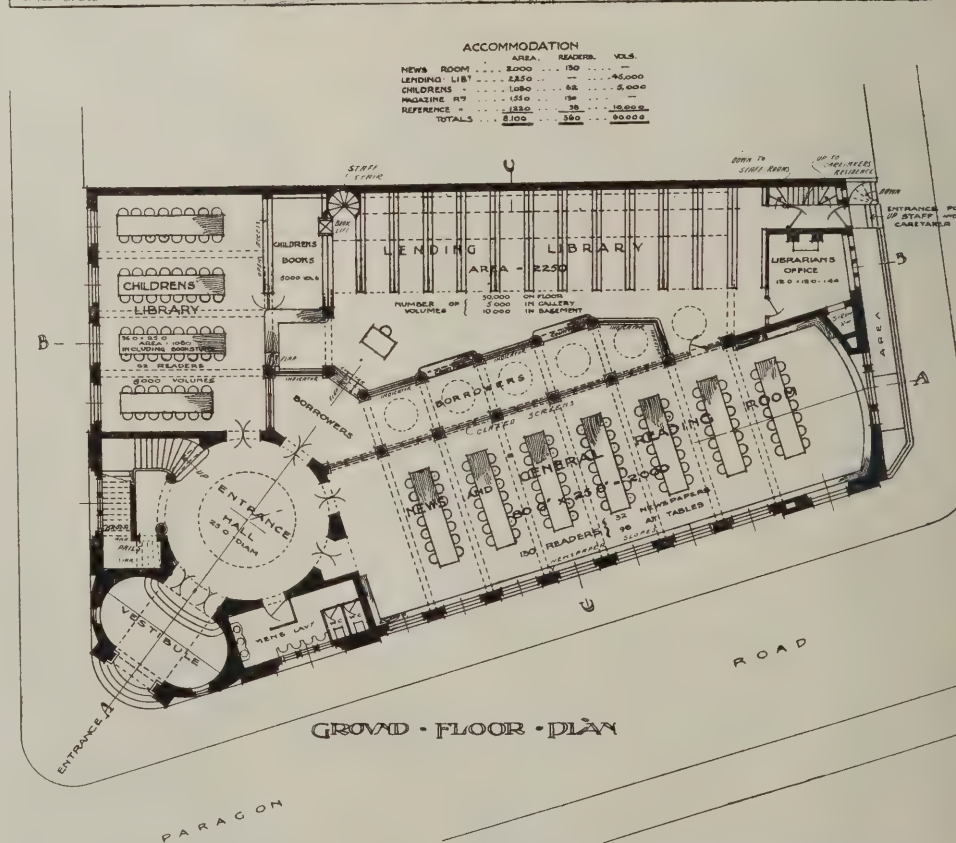

The following further donations to the Building Fund were announced:—

	£	s.	d.
Howell J. Williams, Ltd.	-	10	0
T. Tyrwhitt	-	5	0
W. Morrison	-	5	0
J. E. Franck	-	3	0
J. E. K. Cutts	-	1	0

Mr. Gilbert H. Lovegrove then read a paper on the "A.A. Camera and Cycling Club

Excursions." The paper was prepared at short notice owing to Mr. Vye-Parminster being unable to read his paper on "French Modern Architecture." Mr. Lovegrove dealt with some of the most interesting places visited by the club during the past few years, among them being Wimborne Minster, Bruges, Ypres, Peterborough, Stamford, Greenwich Hospital, London City Churches, Hereford, Ludlow, Ledbury, Oxford and Cambridge. All the places were very fully illustrated by slides from photographs taken by the members.

Mr. Matthew Garbutt proposed a vote of thanks, which was seconded by Mr. E. W. M. Wormacott. Mr. W. J. H. Leverton and the chairman also spoke.

Note.—The first-floor plan has reference library over children's room; committee-room over vestibule; lavatory over lavatory; magazine room (with division for ladies at end) over newsroom; and living-rooms at end facing Valette Road. Stores in the basement.

THIRD-PREMIATED DESIGN FOR HACKNEY CENTRAL LIBRARY.
CROUCH, BUTLER AND SAVAGE ARCHITECTS

NOTES ON COMPETITIONS.

Proposed School at Selby Oak for the King's Norton and Northfield U.D.C.

Last December the committee of the Competition Reform Society warned all their members that certain clauses in the conditions of this competition were unsatisfactory. One of the objections was that the assessor was to assist the promoters in the selection of designs. Nothing was explicitly stated about the author of the design placed first by the assessor being employed to carry out the work. The conditions generally had an unhealthy look, but the competition might have turned out well if left in the hands of a competent assessor, who, by-the-by, had not then—and as far as is known has not yet—been appointed. What is known, however, and the matter is important to anybody who may have disregarded the Reform Society's warning, is this:—An eminent member of the Council of the Royal Institute of British Architects was approached (direct) by the promoters, and asked if he would undertake the duties of assessor. His reply was just what might have been expected in the circumstances, namely, that he would be pleased to act on condition that the author of the design placed first by him was appointed to carry out the work. This the promoters have declined to agree to, and in consequence the gentleman whose services they desired has declined to act. Would that all assessors acted as conscientiously as this in the interests of competitors.

Carnegie Library, Pemberton.

The assessor, Mr. Hartley, in the competition for a new Carnegie library at Pemberton has awarded the first premium of £40 to design No. 7, by Messrs. J. B. & W. Thornley, of Wigan, and the second premium of £20 to design No. 4, by Messrs. Heaton, Ralph & Heaton, also of Wigan. The library committee have accepted Mr. Hartley's report.

Competition for Prince Rock School, Plymouth.

The conditions have been drawn up with due regard to the "Regulations" of the Royal Institute of British Architects. The only objection that can be raised is that the assessor had not been appointed at the time the conditions were issued, but the promoters say that he "shall be nominated by the R.I.B.A." In the interests of competitors it is always desirable that they should know who the assessor is before committing themselves to compete. Only such drawings are to be submitted as are required by the Board of Education, and no perspective view is required. The architects of Plymouth are fortunate at having such a set of conditions to work to.

Elementary School, Ossett.

The Competition Reform Society disapproves of the conditions in the competition for an elementary school at Ossett, because the remuneration is insufficient (being 4 per cent. and to include bills of quantities to contractors) and the cost of £9 10s. per scholar is inadequate. Members are requested to abstain from competing unless the conditions are satisfactorily revised.

Competitions Open.

Owing to pressure on our space we are obliged to hold over the list of competitions open. There are, however, only two new items to add to last week's list, namely:—

Mar. 26	WESLEYAN SUNDAY SCHOOLS AT WILLESDEN.—Particulars from the Rev. M. F. Crewdson, 4, Tavistock Road, Harlesden, London, N.W.
Date not stated.	BATHS, FIRE-STATION AND FREE LIBRARY AT REDDISH.—To cost £5,000. Applications by March 31st to Mr. Robert Hyde, Town Clerk, Stockport, for form of instructions to architects. Deposit £1 is.

SECOND-PREMIATED DESIGN FOR HACKNEY CENTRAL LIBRARY.
DAVISON AND TRIMNELL, ARCHITECTS.

OUR PLATE.

The Church of St. Andrew, Catford, London, S.E.

THIS church was consecrated in 1904 by the Bishop of Rochester. It forms the second part of a scheme which was initiated by a limited competition held in 1899, when the design of Mr. Philip A. Robson, A.R.I.B.A., Palace Chambers, Westminster, was placed first.

The temporary church (now permanent church hall) was immediately built at a cost of about £1,550, the builders being Messrs. J. Garrett & Son, of Balham, S.W. It is a very plain building of rough-cast, but suits its purpose, and has a cheerful air within. It has since been enlarged.

The church was intended to be built in sections, but it was decided to build the chancel as a memorial to the late Rev. J. Pedley, and so the whole church was undertaken minus the tower and spire, as usual. But the architect, knowing how rarely these "additions" bear out their name, revised his plan and permanently cut out these features (1) because a church loses by an unfinished appearance, (2) because the site is clay, and (3) therefore, if ever such a pleasing finish were in contemplation it would be desirable to build a detached tower on the south side, where there is sufficient room. The usual instructions were given to the architect, namely, to seat as many as possible at £10 a head. The contract sum was £8,600, Mr. F. G. Minter, of Putney, being the contractor. The church seats 900 without any galleries.

The side aisles to the nave are only passages, and the stone-ties over them are one day to be carved. The scheme of the planning being to give as many people as possible a direct view of the altar, a wide open nave was a necessity, and a small morning chapel, complete in itself, is in close contiguity to the north door, for daily service. The east windows are intended to be filled with rich glass, for which a scheme has been made; the present light appearance rather spoils a dignified creation. The reredos, too, is quite temporary. The stalls are being made by Messrs. J. Daymond & Son, who have done most of the woodwork in the church, except the pews and litany desk, for which the architect is not responsible. The organ is yet to be erected, as the door in the south wall of the choir shows.

The east end of the morning chapel, which is part of an octagon, has a somewhat novel treatment, inasmuch as the traceried stonework and glazing of the windows form a reredos.

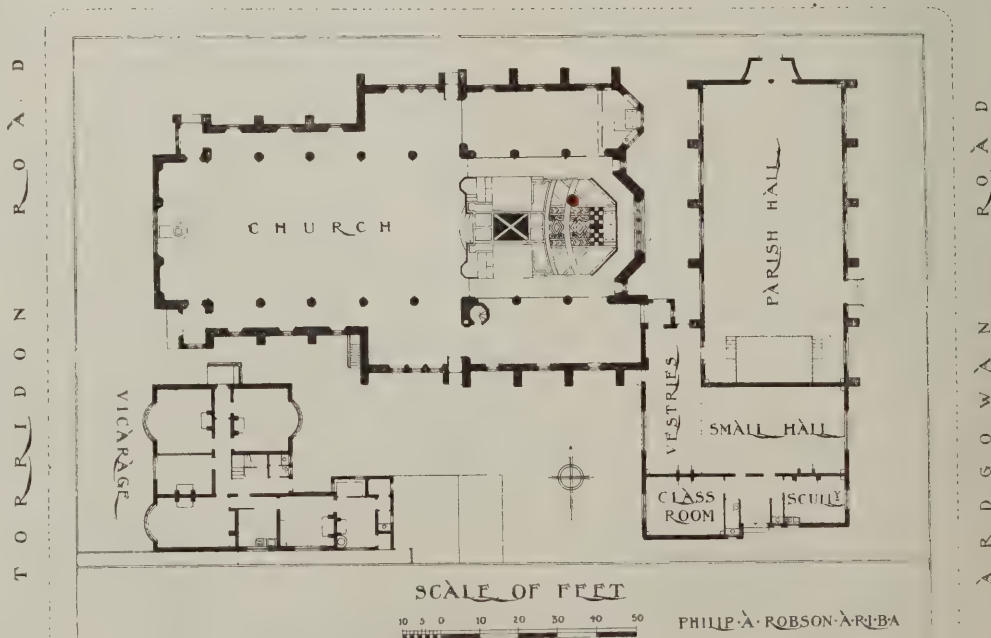

Duffy's "Acme" flooring was used in the nave and granolithic mosaic in the chancel (Messrs. B. Ward & Company), and the sanctuary has a beautiful marble floor. The lead glazing is by Messrs. Wotton & Co., of Croydon. Messrs. Longden & Co. installed the low-pressure hot-water apparatus. The materials are Lawrence's bricks (red), Portland Whitbed stone (externally), Stamford stone (internally), Roman interlocking tiles covering the main roof, and the low roofs covered with grey-green rough Precelly slates. The roof internally, which has the effect of cedar, is of fine red pine.

Liverpool Architectural Society.—Mr. Charles Spooner read his paper on "Church Fittings" before last week's meeting of this Society.

UNIVERSITY OF ILLINOIS

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions must in all cases be addressed to the Editor and be written on one side of the paper only.

Book on Building Construction.

BURY ST. EDMUNDS.—G. P. writes: "What book on building construction do you recommend? I have just been articted to a firm of architects, and have all other books necessary. I do not wish to pay more than about £1." In the circumstances we advise you to get Mitchell's two volumes, and "Specification." The prices are given in our book list.

Measuring a Building.

LEICESTER.—R. G. writes: "In cubing a building do you measure from the bottom of the foundation to half-way up the gable (as C D), or from the bottom of the foundation to the plate (as A B), and, if so, would you take the roof separate and add to that obtained from foundation to plate; also, in that case, would you measure the portion of the chimney seen through the roof?"

The most usual method of cubing a building with a view to estimating its cost is to multiply its area by the height measured from half-way down the foundation to half-way up the roof, as E F. Sometimes the height is measured from the bottom of the footings, as C D. If the building up to the plate level be cubed and added to the cubic contents of the roof, precisely the same result is obtained as by cubing the whole building at once, so it is obviously a waste of time to take those items separately. Unless there is something exceptionally about the portion of the chimney showing through the roof, it would not be considered at all in cubing. All portions of a building, such as annexes,

stables, &c., which are less costly than the main portion, are usually cubed separately and priced at a lower rate. Similarly, very ornate features are kept separately and fixed at a higher rate than the rest of the building. H. Y. M.

Designing a Church Roof.

CAUTIONS writes: "Herewith a tracing of a church roof of 25ft. span. Do you consider the construction sound? The rafters are 5½in. by 4½in, red deal, at 16in. centres, single collar and double braces. I also propose to make the horizontal sole-piece at foot of rafters double. Would it be a better job if I were to put in 7in. by 2½in. pitch-pine rafters at 18in. centres, with two rows of bridging in the length? One scheme means cutting spars from log and the other using scantling sizes."

The form of roof shown in Fig. 1 was, and is still, largely used in church construction, but it is of an expensive character owing to the large amount of material required, as each rafter is separately trussed. Roofs of this kind do not lend themselves readily to calculation, but in this case as the walls are 2ft. gins. thick, provided they are not more than about 15ft. or 16ft. high, they may be assumed as capable of resisting any overturning tendency, and so for the purpose of working a stress diagram the frame diagram may be taken as Fig. 2, where an imaginary tie is substituted for the rigidity of the wall at the wall-plate level. Taking the total load on the roof as 56 lbs. per sq. ft. acting vertically, the stress diagram will be as Fig. 3, which only shows half, the other half being similar. The scantlings given on Fig. 1 are rather stronger than the stresses would appear to require, but as the walls can rarely be assumed as absolutely rigid they will probably be none too large in actual practice. HENRY ADAMS.

Height to which a Structure can be Built.

SHEFFIELD.—D. H. L. writes: "(1) If we take 8 tons per sq. ft. as the safe load on a course of brickwork, and 120 lbs. as the weight of a cubic foot of brickwork, neglecting any question of wind-pressure, to what height may a pyramid of brickwork be safely built? What is the duty supposed to be performed by bonding in this structure? (2) What is meant by saying that the height to which a pyramid of any building material may be raised is three times the height of a column of uniform section? Show how, by attend-

ing to a cardinal principle of construction, you can build a tower of brick or stone of a very great height?"

The first question was given in the Building Construction, Advanced Stage, 1901. The cubic contents of a pyramid are found by multiplying the area of the base by one-third the vertical height to the apex. The weight will therefore vary directly as the area of the base, but the surface of the base, to resist pressure, also varies as the area, so that it is clear that the height will be theoretically independent of the area of the base. Under the condition named let a = area of base, h = height of pyramid. Then $a \times \frac{1}{3}h \times 120 = a \times 8 \times 2240$. Cancel the a on each side, then $40h = 17920$. $\therefore h = \frac{17920}{40} = 448$ ft. The duty supposed to be

performed by the bonding is to spread the load uniformly over each course from the base upwards. The second question was given in the Honours Stage of Building Construction, 1901, and is based upon the same principles. If the bonding of a brick pyramid is assumed to spread the pressure uniformly over the base a solid pyramid of brickwork would have to be built three times the height of a column of uniform section of the same height and area of base to produce the same pressure per unit of area, because the cubic contents of a pyramid are only one-third those of a prismatic figure of equal height and base. One of the innumerable "cardinal principles of construction" is that bricks should break joint by proper bonding in order to distribute pressure and ensure stability; another is that the area of any supporting surface should be sufficient to keep the intensity of pressure within safe limits. In answer to the previous question, it was shown that with a maximum pressure of 8 tons per sq. ft. a brick pyramid with any size of base could be built to a height of 448ft., and this was without any allowance for wind-pressure, although such allowance ought certainly to be considered a cardinal principle. In order to build higher than this it will evidently be necessary to hollow the profile of the pyramid, and as this follows the principle of nature in the

outline of trees it might also be considered another cardinal principle. Which one the examiner referred to it is impossible to say.

HENRY ADAMS.

Notes and News.

The Alphons Custodis Chimney Construction Co., of 119, Victoria Street, Westminster, have been entrusted with the construction of the chimney-shaft at the Southern sewage works, Ealing.

The St. Pancras Ironwork Co., Ltd.—Mr. Arthur Pye Smith has been elected chairman of the board, and Messrs. Hugh Leader and T. Percival Chubb have been elected directors of this company.

Mr. H. Skyrme, architect, has opened offices at 138, Widemarsh Street, Hereford. He was for many years with Mr. F. R. Kempson, F.R.I.B.A., of Hereford and Cardiff, and in the latter city he held the post of head assistant.

Fall of a Church Tower.—The tower of All Saints' Church, Stanton, Suffolk, collapsed last week, but fortunately it fell clear of the church. For some time past it had not been considered safe to ring the bells in the tower, but no other danger was apprehended.

Plasterers' Wages Arbitration.—The National Society of Operative Plasterers have been successful in an arbitration with the London Master Builders' Association concerning a proposal by the masters to reduce the rate of pay $\frac{1}{2}$ d. per hour, from 11d. to 10 $\frac{1}{2}$ d.

Leeds and Yorkshire Architectural Society.—Mr. H. Phillips Fletcher read his paper on "The St. Louis Exhibition" before last Thursday's meeting of this society. (The paper was reported in our issue for April 12th, 1905, when it was read before the Architectural Association.)

Mud.—The following is taken from the London "Star": "A new use has been discovered for the thin liquid mud so prevalent on the roads in Kentish rural districts at this time of the year. It has been found to answer the purposes of cement, and is expected to be largely used in the repair of agricultural buildings." Comment is needless. We would observe, however, it is on record that mud has been used for mortar before; also garden mould and house rubbish.

The Position of Specialists on Building Work.—At the recent annual dinner of the Nottingham Master Builders' Association (Mr. F. H. Fish, president, in the chair) Mr. James Wright submitted "The Architects and Surveyors." He was glad to know that the feeling between the architects and builders in Nottingham was on a very much better footing than it was a few years ago. The Royal Institute of British Architects, the Institute of Builders and their own federation had produced a recognized form of contract, which was believed to be a reasonable, businesslike and equitable document, and it was very desirable that this should be generally adopted. The questions of prime costs and of specialists outside the builders' jurisdiction wanted careful handling. It had become a very general practice for specialists to be appointed by architects to carry out such works as the construction of steel floors, concrete and wood-block floors, &c. The specialists came on the work without notice to the builders and treated the latter as interlopers, when, after all, it was the builders who were responsible for the contracts. They accepted the position of introducing the specialists, but he thought that notice should be given to the builders and that the specialists should be treated as sub-contractors. That was provided for by the form of contract which he had mentioned, and he hoped to see it adopted.

Henry Saxon Snell Prize.—The subject set for this prize (£50), to be adjudicated in January, 1907, is a critical report on hospitals for the treatment of consumption.

Beckenham Church to be Completed.—It has been decided to proceed with the building of the nave of St. Michael's and All Angels' Church, Beckenham, Kent. At present the building consists of the chancel and a temporary nave. The proposed work will cost £4,000.

Then as Now.—In his lecture on the evolution of sculpture—Egypt and Greece—at the Royal Academy last week Sir William Richmond said there was a period of decline in art in the time of Rameses the Great. It grew coarser, and sculpture became degraded, although a high level of workmanship was maintained. There was, however, a great increase in the demand for it, and this led to the formation of a regular trade in sculpture in and about Thebes. But the artist had lost the old freedom in his work. All statues had to agree with certain canons to fit in with an ideal, so that in the end a mannerism took the place of the portraiture.

IN PARLIAMENT.

(By our Press Gallery Representative.)

THE following are some of the more important questions relating to building matters which have recently been addressed to ministers in the House of Commons:—

The new Processional Road.

Mr. Claude Hay asked the First Commissioner of Works if he would say what was the present position in regard to the Charing Cross entrance to the new road in St. James's Park, and when it was likely to be completed and thrown open for public traffic.

Mr. Harcourt replied that the foundations of the buildings and entrance to Charing Cross were in course of construction, but it was impossible to fix a date for the opening of the road, which must depend upon the completion of the buildings.

Irish School Plans.

Mr. McKenna, the Financial Secretary of the Treasury, informed Mr. Boland that the matter of new plans for national schools in Ireland was still under consideration.

British Granite again.

Mr. Harry Marks asked the Secretary to the Admiralty whether the contractors for harbour works were required to use British granite only; whether British granite only was to be used on the Keyham Harbour works; and whether he would give instructions that all contracts over which the Admiralty had or might hereafter have control should stipulate that only British granite should be used on such works.

Mr. Lambert, Civil Lord of the Admiralty, said the answer to the three parts of the question was in the negative, with the qualification that the Board of Admiralty could not fetter their future action.

Admiralty Works.

A memorandum which has been presented to Parliament shows the progress and expenditure on items included in the Naval Works Act of 1905. The total estimate for the Portland Breakwater was £650,000, and this item has been completed. The total estimate for Dover Harbour was £3,500,000, and the estimated expenditure up to the end of this month is about £2,686,000. The date for completion given in the 1905 Act was 1908-9. The Admiralty Pier extension, the east arm and the east reclamation, are all completed, except the above-water work at the extremities of the breakwaters. The south breakwater is making good progress, and a length of about 1,950ft. has been brought up to water-level. The total estimate for Keyham Dockyard extension was £4,500,000,

and the expenditure up to the end of this month will be about £3,721,000. The expected date of completion is 1908-9. The three graving docks and the entrance lock are completed, and it is expected that one dock will be ready for docking a ship by June next, or earlier. Among the items completed are Portsmouth Naval Barracks, Keyham Naval Barracks, Chatham Naval Hospital, Walmer Marine Depot, Keyham Engineers' College, Haslar Hospital extension, and Haulbowline Zymotic Hospital.

Obituary.

Mr. Frank Whittingham, architect, of Wrexham and Connah's Quay, died on Wednesday. He was only 28 years of age.

Mr. David Meikle, one of the original partners of the firm of Messrs. J. & D. Meikle, building contractors, Ayr, died recently, aged 86.

The late Mr. William Bate, of the firm of Messrs. Bate Brothers, builders, of Bridgnorth, who died on February 7th, left estate of the gross value of £62,827.

Mr. John Price, city surveyor for Birmingham, died last week. Mr. Price, who was in his fifty-first year, became surveyor to the Birmingham Corporation in 1896, having previously been assistant engineer in Liverpool. Since he had been in Birmingham he had carried out a number of important engineering works.

ARCHITECTS' BENEVOLENT SOCIETY

Annual Meeting.

THE annual meeting of the Architects' Benevolent Society was held on Friday at 9, Conduit Street, Mr. J. Macvicar Anderson presiding in the absence of the president, Mr. John Belcher, A.R.A.

The hon. secretary, Mr. Percivall Currey, read the annual report, in which the council expressed regret that, judging by the number of claims made upon the Society, the past year seemed to have been one of exceptional difficulty for many of the less fortunate members of the architectural profession. Towards the middle of the year it was found that the demands made upon the Society were beginning to outweigh the funds at the disposal of the council, and that it was necessary to consider means by which the income could be increased. The president (Mr. John Belcher) acceded to a suggestion that he should issue a personal letter of appeal, and this was sent out to 5,280 architects practising in the three kingdoms. The president directed attention to the fact that, although the Society had been in existence for over fifty years, and was the only institution organized specially for the relief of architects or their widows and orphans, not more than 1 per cent. of architects in active practice contributed to its support. As the income had suffered in recent years from the loss of many liberal contributors, the president appealed particularly for subscriptions. Compared with the support hitherto accorded, the result of the appeal must be considered satisfactory, the subscriptions having been increased about 20 per cent, while a considerable sum has been added to the capital. In connection with the appeal, the council specially called attention to the offer of a donation of £50 by Mr. Walter Emden, provided nine other contributions of an equal amount are received. Mr. Emden's offer has so far been supported by Mr. William Glover, Mr. H. Chatfield Clark, and the Society of Architects.

The total amount of subscriptions received during the year was £615 19s. 6d. (in 1904 £539 5s.), while the donations amounted to

£65 17s. (in 1904 £143 is.). £1,000 was distributed in grants and pensions, the number of applicants, apart from pensioners, being 86, out of which 80 were granted assistance.

Through the courtesy of Mr. John Holden, the Society's honorary local secretary at Manchester, the council have been informed that Mr. Alexander W. Mills, of Bowdon, Cheshire, an old subscriber, has bequeathed to the Society £500. Further bequests of £1 from the late Mr. C. Forster Hayward, and two Architectural Union Company's shares from the late Mr. H. H. Collins, have also been received. It is with great regret at the council have to record the death of these members (Mr. Collins was also a member of the council at the time of his death), as well as of Mr. Alfred Waterhouse, Mr. J. T. Wimperis and Mr. G. Fowler Jones, old subscribers.

The council desire to express their appreciation of the kindness of the committee of the A. Students' Smoking Concert in devoting part of the proceeds of the concert on February 2nd to the funds of the Society, the amount received being £12 12s.

The thanks of the Society are due to the Royal Institute of British Architects for office accommodation, and for the use of rooms in which to hold their meetings, and to the secretary (Mr. Locke) and his staff for their helpful courtesy in all matters connected with the Society.

The chairman, in moving the adoption of the report and balance-sheet, said that in some respects the report was satisfactory, as the subscriptions exceeded those of the previous years, but the fact remained that their efforts to raise a certain sum had only been successful to a partial extent, though he ventured to hope that they would complete the sum before long.

Mr. H. L. Florence seconded, and the motion was carried.

A vote of thanks to the retiring members of the council was passed on the motion of Mr. Arthur Ashbridge, seconded by Mr. G. Cannell.

The following elections took place, on the motion of Mr. Andrew Taylor, seconded by Mr. Osborn C. Hills:—President, Mr. John Elcher, A.R.A.; vice-president, Mr. William Elver; council, Messrs. Rowland Plumble, J. T. Hine, Ambrose M. Poynter, William Millier, H. L. Florence, G. B. Bulmer, F. W. Hunt, W. L. Spiers, Arthur Ashbridge, Walter Emden, Reginald St. A. Roumieu, Chatfield Clarke, Alfred Saxon Snell, and Colonel R. W. Edis, C.B.

Mr. W. Hilton Nash was re-elected treasurer, with thanks for his past services, on the proposition of Mr. Christopher, seconded by Mr. Rowland Plumble.

Mr. Percivall Currey was re-elected treasurer with thanks, on the motion of Mr. Rowland Plumble, seconded by Mr. Christopher.

Mr. W. Grillier moved and Mr. W. Spiers seconded the re-election of Messrs. Edward Greenop and Sydney Perks as auditors. An alteration in by-law 7 was proposed by Mr. W. Hilton Nash, seconded by Mr. W. Spiers, and carried. The object was to enable societies, allied societies and corporate bodies who are now or may become annual subscribers of not less than ten guineas, or donors of one sum of not less than fifty guineas, to be represented on the council by their president or chairman for the time being, who may also vote at all meetings, and to be entitled, on behalf of his society, to the same privileges as those of individual donors or subscribers.

A vote of thanks was accorded to the I.B.A. for the use of their rooms, on the motion of Mr. H. L. Florence, seconded by Mr. W. Hilton Nash.

A vote of thanks to the chairman concluded the meeting.

Law Cases.

An Accident on the new Central Library Building at Bristol.—At the Bristol County Court recently a young labourer named Cross brought an action under the Workmen's Compensation Act for half-pay during a period of incapacity caused by an accident whilst in the employ of Messrs. H. Willcock & Co., builders, of Wolverhampton, the contractors erecting the new central free library, Bristol (Mr. H. Percy Adams, architect). The accident, which resulted in severe head injuries, was occasioned by a brick falling on Cross whilst he was mixing up cement on the building on September 30th, 1904. The respondents took the ground that Cross was not incapacitated from employment, and that there was no responsibility on their part. The judge upheld this view and made an award in favour of respondents.

An Interesting Irish Light Case.—In the Chancery Division at Dublin recently Mr. Justice Barton gave judgment in the case of *Black v. Scottish Insurance Co., Ltd.* The plaintiff, a clothing manufacturer, claimed an injunction against the defendants for the erection of a building at the corner of Bedford Street and Donegal Square which, it was contended, obstructed the ancient lights of plaintiff's factory, warehouse and cutting rooms at the north side of James Street South, and for permitting to remain any building already erected which would cause such obstruction, and also for damages. The company had expended about £64,000 on the erection of the building in question. They denied that it interfered with the plaintiff's light, and asserted that there was sufficient light through the plaintiff's windows for ordinary trade purposes. Mr. Justice Barton, in delivering judgment, said the rule of the law in these cases laid it down that the measure of light which the Court was to have regard to was not what was needed for a special requirement but for the ordinary purposes of inhabitancy or business. A plaintiff to succeed in an action for infringement of light must show real injury and not partial inconvenience. The plaintiff in the present case turned out 120,000 suits a year, 75 per cent. of his trade being in juvenile suits of navy blue. His patterns and material had to be compared at all stages of manufacture, and this kind of work required a northern light, and the lights interfered with were northern lights. In the manufacturing part of Belfast no linen or woollen factory was complete without accommodation for examining goods. In some parts of the trade a special light was necessary. But plaintiff's business was not what was called the fine end of the trade. The plaintiff did not require a special light. An ordinary good light was essential and enough. The defendant company had erected a building of unusually large dimensions in place of a smaller building, the height to the eave being 72ft., while that of the plaintiff's building, which it overlooked, was only 36ft. The new building was also 15ft. nearer the plaintiff's premises than the former premises. The obstruction complained of was lateral and from a wall built of red brick, and evidence was submitted that it might be innocuous if faced with white brick. The defendant company, it was also shown, were careful to use white brick where their own lights were likely to be affected. However, the question of the colour of the bricks was only one of the elements in the case, coupled with the great height and close proximity. The plaintiff's business consisted of five rooms, and having considered the circumstances of each it seemed that the real or important injury was to the examining-room on the first floor, as it was here that the matching of colours and examination of suits for defects of colour took place. Defendants' witnesses admitted that an examining-room

was necessary for the business, and before the building in question was erected the room was adapted to its purpose. There was a large body of evidence which forced him to the conclusion that it was now practically useless for such purposes. It was impossible to say whether, and, if so, how far, the result might have been obviated if the wall had been built of white brick, or if it were kept effectively whitewashed. Be that as it might, his Lordship said he could not resist a large body of evidence that the new building had rendered the room practically useless for its appropriate purposes. On this part of the case very interesting evidence was given that a person working at the window of the room was rendered practically colour-blind for the purpose of matching blue cloth owing to the red rays from the brick wall. The case, however, did not depend entirely on the evidence of experts, but also on that of a considerable number of independent business men. While coming to the opinion that plaintiff had exaggerated the damage he had sustained in putting it at £1,000, his Lordship was forced to the conclusion, on the whole case, that the defendants' building had been proved to be an actionable nuisance. He would not, however, make any decree in the form of a mandatory injunction to pull down the building, although that was the form he ought to adopt if he were satisfied that the nuisance could not be obviated. The decree would be in the form of restraining the defendants from keeping erected the building so as to create a nuisance. That would leave it open to them to obviate the nuisance if they could. After that, of course, there would be liberty for both sides to apply as they might be advised.

Bankruptcies.

DURING THE WEEK ending March 9th twenty-one failures in the building and timber trades in England and Wales were gazetted.

E. C. PIPE, builder, Lowestoft. R.O. Feb. 28th.

J. CHARLES, bricklayer (late builder), Hull. P.E., Hull C.C., March 10th, at 2.

PRICE & REES, painters and house decorators, Swansea. R.O. March 1st.

G. H. KILVINGTON, builder, York. Gross liabilities £4,151; expected to rank £643; assets £586.

J. R. SHORLAND, builder, Margotfield. Liabilities £238; assets nil.

E. A. CHASE, builder, Bristol. Liabilities £2,204; assets £1,578.

W. WHITE, builder, New Brislington. Liabilities £3,125; estimated assets £3,150.

HOSKEN BROTHERS, builders, decorators, &c., Richmond. Adj. Feb. 27th.

HERBERT & JONES, builders and contractors, Kew Gardens. Adj. Feb. 28th.

H. DODD, builder and contractor, Liverpool. Liabilities £879; assets £260.

J. M. JOWETT, builder and contractor, Leeds. Deficiency £424.

C. W. PERRETT, builder, Paignton. Liabilities £700; assets estimated at £1,480.

W. WEBBER, builder, London, E.C. Liabilities £600; assets £135.

BUTT BROTHERS, builder, London. Liabilities £14,069; estimated to rank £972; estimated surplus £2,695.

S. BRANFORD, painter and plumber, &c., Claverley. P.E., Madeley C.C., March 14th, at 11.30.

E. YOUNG, builder, Eastleigh (late Twyford). P.E., Southampton C.C., March 28th, at 12.

J. H. SANDERS, builder, Bromley. P.E., Croydon C.C., May 2nd, at 11.

J. P. WOOLCOCK, builder, Penryn. P.E., Truro Town Hall, March 17th, at 11.45.

C. E. NICHOLLS, builder, Barlow Grange. Adj. March 3rd.

R. E. MAYO, builder, Brixton Hill. First meeting, London Bankruptcy Court, March 16th, at 12. P.E., same, April 6th, at 11.30.

J. E. BYGATE & A. McGRATH, slaters, Barnsley. First meeting, O.R.'s, Barnsley, March 14th, at 10.30. P.E., Barnsley C.C., March 14th, at 11.

T. WEEKS, slate merchant, Willesden. First meeting, London Bankruptcy Court, March 15th, at 12. P.E., same, April 10th, at 11.30.

J. METZ, builders' merchant, London. First meeting, London Bankruptcy Court, March 16th, at 11. P.E., same, April 6th, at 12.

WOODWARD & CO., surveyors, London. First meeting, London Bankruptcy Court, March 14th, at 1. P.E., same, April 3rd, at 12.

BARRETT, SON & DAVIS, builders and contractors, Dorchester. First meeting, O.R.'s, Salisbury, March 20th, at 1.30. P.E., Dorchester County Hall, March 30th, at 10.30.

W. R. & J. H. WALKER, builders and contractors, Smethwick. First meeting, 191, Corporation Street, Birmingham, March 14th, at 11. P.E., West Bromwich Law Courts, March 16th, at 10.30.

Complete List of Contracts Open.

News of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our last issue of other contracts that still remain open.

Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Mar. 15. Barnard Castle.—*Pair of semi-detached cottages.* Full particulars may be obtained from T. Farrow, architect, 7, Market Place, Barnard Castle, to whom names and addresses must be sent by Mar. 15.

Mar. 15. Trefonen.—*Reconstruction of schoolrooms, classrooms, cloakrooms, urinals, &c.,* at the schools, in accordance with drawings (1 to 5) and specifications prepared by W. Pennant Ellis, architect and surveyor, Town Hall, Rhyl, N. Wales. The drawings may be seen, and a copy of the specification, also form of tender, obtained from the Rev. George Williams, M.A., The Rectory, Trefonen, between 10 a.m. and 3 p.m., upon payment of a deposit of £1 rs. Tenders, sealed and endorsed "Tender, Trefonen, Oswestry, National Schools," must be delivered at the Rectory not later than 10 a.m. on Mar. 15.

Mar. 17. Spennymoor.—*Alterations and additions* to the Administrative Block at the Isolation Hospital. Plan and specification may be seen and forms of tender obtained on application to C. R. Spencer, surveyor to the Council, Council Offices, Spennymoor. Tenders, marked "Hospital," to be sent to F. Badcock, clerk to the Council, Council Offices, Spennymoor, by Mar. 17.

Mar. 17. Glasgow.—*New offices* proposed to be erected behind Chambers, No. 7 and 8, Carlton Place, Glasgow, for the Govan Combination Parish Council, as follows:—Excavations, brick and mason works, also steel beams (one schedule), wright work, slater work, plumber work, plaster work, painter work. Schedules may be obtained and plans seen on application to John Gordon, architect, 261, West George Street, on payment of £1. Offers, marked "Tender for — Work, New Offices," to be returned to John Mitchell, inspector and clerk, 7, Carlton Place, on or before 10 a.m. on Mar. 17.

Mar. 19. Ross.—*Stabling* at The Coppice, Bishopswood, Ross, for Sir George Bulloah, according to the plans and specification prepared by Arthur H. Pearson, architect, Ross, which can be seen at the Post-office, Bishopswood. Quantities may be obtained, upon payment of £1, upon application to the Architect. Tenders, endorsed "The Coppice" (which must be on the form provided), to be delivered at the Architect's Office not later than noon on Mar. 19.

Mar. 19. Maescywwmmer.—*New C.M. chapel and schoolroom.* Plans may be seen and bills of quantities obtained of Morgan James, The Factory, Maescywwmmer, on deposit of £2 2s. Sealed tenders, endorsed "New Chapel," to be sent to John H. Davies, secretary, 6, North Avenue, Maescywwmmer, by 5 p.m. on Mar. 19.
